The preceding note was written, when I put down my pen, lighted a pipe, and walked into an adjoining room, and there on a table my eyes fell upon a book which Mr. Halford sent me last summer, bearing the title I have used for the head of this note. When I received it I intended to write a notice of it, but being much away from home, it escaped me in the brief visits that I made to my writing table. For some reason I neglected to make a memorandum of it on my "Angling Notes" sticker, and it had passed completely out of my mind until, having written of May and caddis flies, it seemed to force itself upon my notice in a manner that may be set down as a coincidence. I was fairly startled when the gilt title of the book appeared to me in the gas light, because on several occasions recently I have been discussing coincidences and "mind telegraphy," as I believe Mark Twain calls it, with a friend who has a record in this particular line. The book having brought itself to my attention, I am in duty bound to write something about it now, although I had put down my pen for the evening, intending to leave home on the first train tomorrow morning. Let me premise, however, that it is always a pleasure to write of Mr. Halford's books; but I do not like to have them startle me and prick my conscience at the same time.

Mr. Halford's latest book, "Dry Fly Entomology," is the natural sequence of his former works upon "Floating Flies and How to Dress Them" and "Dry Fly-Fishing in Theory and Practice," as they cleared the way for and rather made the last volume necessary to all who practice the highest style of fly-fishing. The title page describes the book as "a brief description of leading types of natural insects serving as food for trout and grayling, with 100 best patterns of floating flies and the various methods of dressing them." The flies used in dry fly-fishing are almost without exception imitations of natural insects, and in the case of winged flies by far the greater proportion have upright wings, or "cocked-up" wings, which distinguish them from flat-winged flies, of which Mr. Halford mentions not to exceed half a dozen specifically, while the hackles, or flies without wings, are more numerous. The fact that in dry fly-fishing the fly is cast and permitted to float on the surface of a slow-moving stream where the trout have an opportunity to examine it, and perhaps compare it with the real fly that it is supposed to represent, makes it necessary that the flies must represent nature as closely as the fingers and brain of the fly dresser can fashion them from feathers, silk and tinsel. Any old fly will not do in this method of fishing, as in wet fly-fishing, when the fly is drawn through the water beneath the surface and the fish takes it, perhaps because it has the appearance of life and can be rejected if it does not suit its fancy or palate after a trial.

The dry fly must be fashioned to deceive the very elect of educated trout when the real thing is floating on the water. The 100 patterns of flies, in colors, magnified, and natural size, would alone be worth the price of the book to any fly-fisherman, if it were not for the descriptions and illustrations of the natural insects, and I turn to the latter briefly because the colored plates speak for themselves.

Almost at once I find this interesting statement concerning the caddis worm: "Soon after they are born the larvæ leave the jelly-like mass in which the eggs were enveloped, and at once commence case making. It may here be remarked that the larvæ in this order are vegetable feeders, living on leaves and shoots of plants, such as water celery, water crowfoot, etc. They do not, however, despise larvæ of other aquatic insects, whether those of the smaller ephemera, or gnats and other diptera, or even those of their own genera, which before devouring they tear from their cases." Had I read this book thoroughly, as I should have done when it was received, I would not have speculated so long as I did as to what had become of the caddis worms in my bottle when at four call only one responded where there should have been four or five. I did not know that they were other than vegetable feeders until this evening I read what I have quoted from this book.

The author says that an examination of the May fly shows that the average number of eggs laid is 6,500, and that the larval and nymphal stages of the May fly last certainly two, and perhaps three, years. Mr. Halford applies the term nymph to that stage when rudiments of wings become visible. Eggs of the May fly hatched in captivity produced larvæ on Aug. 15, the eggs having been laid on June 9, but it is thought that temperature conditions may determine the period, as they are known to hatch on the River Test in three weeks instead of ten, as in London in captivity.

It is very difficult to select from this part of the book matter to be quoted, for every portion of it should be read by fly-fishermen, no matter whether they cast the fly dry or wet. The habits of the different insects are given, and they are illustrated on finely drawn blocks. May fishermen have cast duns, spinners, olives, with vari-

ous pre- or suffixes, without knowing much about why they were so named; but Mr. Halford gives every one an opportunity to know all about them, and how they look at different stages of development; and a man who understands this part of the book will turn to the 100 patterns of counterfeits of the insects with more interest, and he will better understand how and when to use them in fly-fishing.

Flies on or under the Surface.

In the language of the play-bill, four days are supposed to have elapsed between the last note and this one, and as a matter of fact they have elapsed. Upon my return home I find a letter in my mail which I desire to quote from, and properly it fits in just here. Mr. A. St. J. Newberry writes me from Cleveland, O., as follows: "Some time ago I read in *FOREST AND STREAM* a discussion from your pen as to whether big trout, say 2 lbs. or over, ever or often took a fly on the surface, and understand you to say that your experience had shown that trout of such size rarely, if ever, took a floating fly, while they were readily tempted by a sunken one." What I wrote of was wet fly-fishing, not dry fly-fishing, in which style the fly is taken while it is actually floating on the surface of the water. Now I will continue with the letter:

"Of late years I have done considerable fishing along Lake Superior, especially at Munising Bay, and in waters where the trout run large, but which are so clear, cold and bracing that the big fellows seem to retain, to a surprising degree, the dash and snap which is so characteristic of small fish in our Eastern waters. At Munising my good catches have averaged over 1 lb. and contained many fish of 2 and 3 lbs. each. The water is very clear and the trout shy, and a long line must be cast to make success possible.

"Of course, with a long cast and two or three large flies,

THE FLORIDA SHACK.
(U. S. Cartridge Co.)
Photo by Boston Camera Exchange.

some of the flies must be beneath the surface until the line is pretty well recovered and the rod consequently about vertical, when I have found all three flies show. The upper fly, however, has seemed rarely, if ever, to go out of sight, and certainly comes to the top as soon as trailing the cast has fairly begun. Now in all my fishing in this locality I have found the upper fly takes the very great majority of fish, even when all the flies on the leader were of the same kind and size. This predominance was always great, and on the day in last August when 'My Best Catch,' reported in *FOREST AND STREAM*, was made, out of thirty-one fish twenty-nine took the upper fly. On that day I had only two flies, and they were both dark Montreal, No. 4 hooks, exactly alike. The catch included four fish, of about 3 lbs. each, and quite a number of 2 lbs. or over.

"Every one of these fish went well out of the water on his rise, but seemed to me not to rush at the first fall of the cast. I thought the drop of the flies attracted their attention, but that they did not start after them until their motion simulated straggling insects, and then they went for the one that made the most disturbance, which of course would be the dropper, trailing on the surface.

"When these fish have risen sparsely, or not at all, I have often taken them by making a long cast and letting the flies sink well down; then jerk slightly, rest, reel in a little line, rest, jerk again, and so on; and I confess that trout so taken averaged very large. But there is comparatively little fun in trout fishing if you take away the splendid start and shock to the nerves as a great fish explodes out of the still water. Such fishing is the milk without the cream.

"I always hesitate to form theories about fishing, or anything else, for that matter, for one's experience can at best only be very partial; but I think it correct to say that in such cold and clear waters, where trout normally are of large average size, when really hungry a 2 lb. trout will not only take a fly on the surface, but prefers it to the same fly entirely immersed. Doubtless under less favorable conditions the reverse may be the case."

The letter I have quoted is a very interesting one, and the writer of it is an observant man. When I said that I took my large trout this season on flies sunk below the surface, I did not mean that I deliberately sank them before I began to draw them to recover for another cast. This I have frequently done in black bass fishing. I imagine that by fishing side by side with Mr. Newberry I could better make clear to him what I mean by flies beneath the surface, for my idea is that many men think and believe they are fishing on the surface when really their flies are beneath it; but Mr. Newberry must not understand that this refers to him. With flies what I call just beneath the surface the trout in rising, make everything jingle in a way to make the fisherman's hair curl. At another time I will say a little more on this subject.

A. N. CHENEY.

Grasshoppers Did It.

Editor *Forest and Stream*:

Aberdeen, in your issue of Feb. 5, seems to doubt the statement of a writer in the *New York Sun*, that the trout is a sly and wary bird, and appeals to some of your correspondents for more light.

He quotes: "The angler who moves along the banks of a stream, keeping close to the water, is bound to come home with an empty basket. Trout are as wary as snipe, and the sight of a fisherman or any other man sends them to cover with lightning-like rapidity."

Now I modestly admit that I can't fish worth a cent. Even that ingenious and inexhaustible writer on fishes and things, Fred Mather, could beat me. I used to catch trout, but not in a scientific and honorable way; and for the benefit of Aberdeen I'll relate a bit of my experience:

I'm now an oldster, but when I was a youngster I spent a summer at a quaint and beautiful little village nestled down among the hills of Maine, and a small stream that rippled through it harbored trout, otherwise "speckled beauties." Far be it from me to go for the innocent things with artificial flies, "with intent to deceive." I fed them with genuine grasshoppers, because I believe in doing as Rome does when I'm in Rome. The boys came in with strings of little trout, but they never had a large one, and being only covetous of that kind I thought this matter over and concluded that there must be some and I must have them; so I set about it. If an angler goes carelessly along the edge of a brook and shows himself to its tenants, the big ones will find a place to hide and the biggest grasshopper cannot tempt him to come out; but the little fellows are ready to grab it. As I knew all that, I would cast an eye ahead, and when I saw a place where I thought a respectable trout could hide I would slip silently up, and without showing myself let my bait down cautiously and slowly over the bank, and the largest fish would be the first to take it. I did not do that kind of fishing for sport, but my companion and I wanted a couple of trout for breakfast every morning, and the same for supper; and as they were from 10 to 12 in. long, two were all I wanted at a time.

I took one trip of half a mile down the brook and came back with half a dozen; and as I carried them through the village I was surrounded, and every one wanted to know where I got them. They said they never saw such trout caught about their place before. So I got the reputation of being a wonderful trouter. They said all that was needed was a heavy dew, and I could catch them anywhere on the lawn.

I remember being on the Conway meadows once upon a time, and standing on a bridge I enjoyed the futile efforts of two men to induce two fine trout to take the tempting bait they trailed before them. Their patience at last gave out, and they left with cuss words oozing from their mouths, while I was wearing a smile that reached across my face. I walked up to the house for my rod, and when I returned to the bridge I hitched a grasshopper to my hook, and without looking over I dropped it slowly down, and before it reached the water I heard a splash as one of them jumped up out of the water for it; and after letting it drop a few inches further he caught it, and I lifted him out. I waited a few minutes for the other one to lay aside his suspicions, and then treated him in the same wicked way. DIDYMUS.

ST. AUGUSTINE, March 7.

CHICAGO AND THE WEST.

CHICAGO, Ill., March 19.—The membership of the newly organized Milwaukee Rod and Reel Club, mentioned earlier, is at this date reported to be as follows: John P. Murphy, Dr. R. G. Richter, Benjamin M. Weil, Benjamin Skidmore, Jr., H. C. Reed, W. E. Furlong, W. H. Momen, Francis Bloodgood, Jr., Joseph B. Doe, S. Caro, G. B. Crossman, John D. McLeod, W. H. Miller, Edward Voss, Benjamin Sivyer and Frank Williams. The election of officers will be held March 23 at the Hotel Pfister, and a president, vice-president, secretary and treasurer and five directors installed.

In Milwaukee, Ripon, Fond du Lac, Appleton, Berlin and many other Wisconsin towns there is being passed about a letter of agreement which touches upon a singular point. The agreement, which is receiving many signatures, reads as follows: "The undersigned, piscatorially inclined, each hereby mutually agrees to and with each other for the purpose of encouraging true sport and to discourage so-called 'pot hunting,' that he will not during the year 1898, directly or indirectly, buy trout, nor directly or indirectly hire any person to catch trout for him." This odd movement is really a good one, and one of worthy sportsmanship. It is aimed against the practice, all too common, of anglers who go out for a limited time, and who, meeting bad success, hire local men to fish for them, or who purchase fish of others who have them already caught. This is in no sense sport, and it is practically carrying the game and fish market into the woods, to say nothing of its being very destructive of the fish. On many trout streams the local market fishers make such a close sweep of the waters in order to sell the fish to the anglers that the anglers find none left for themselves. They are beginning rightly to argue that if no one bought any trout there would be more trout left for sportsmanlike taking. Is it possible we are to see no more of the time-honored picture of the small boy with the pin hook and the string of trout which he is ready to sell?

Impertinent.

It was a bit impertinent of a certain band of market fishermen at Quincy, Ill., the home of Supt. Bartlett, of the Fish Commission, to explode a lot of dynamite under the ice on the river front and kill a ton of fish. I hope they will not blow up the new fish boat of the Commission. Methinks this is the sort of "first offense" which will need a strong alibi. But if they were only killing some of Dr. Bartlett's carp, there are extenuating circumstances.

Exposition Notes.

THE live game and other animals are the dominating features of the first hall. The central game inclosure is so large (50x40ft.), so cunningly set off with evergreens, and so generously stocked with game, that the visitor for a moment loses consciousness of the fact that it is all within doors. Here as in the other inclosures the Page woven wire fence is used. This, while abundantly strong and secure, is so open that it offers no interruption whatever of the view. Owing to that perversion of inanimate things which every amateur photographer has occasion to discover, the Page fence stands out in our illustration much more obtrusively than it does when actually looked through.

In one division of the yard are fourteen elk, brought from the Corbin Blue Mountain Park in New Hampshire. They are in charge of William Morrison, who, it will be remembered, had the care of the Corbin buffalo during their stay in the Van Cortlandt Park in New York city. The elk are all in capital condition, and have their winter coat. The two bulls were wearing horns when they reached Boston, but one shed his set on Wednesday of the first week, and on Thursday the other showed such symptoms of dropping his that Keeper Morrison and the FOREST AND STREAM photographer were in a condition of nervous suspense, until repeated attempts with the camera had secured the capital portrait here given of the old fellow with his antlered front yet intact.

In another division of this central paddock Mr. Philip Selick has his three moose, a mother and two children. Mr. Selick comes from New Brunswick. He captured the original moose in the snow, at a spot thirty-six miles from his home up the Restigouche and twenty miles more up the Patapedia. That was twelve years ago, when the moose was a yearling. The captive quickly became domesticated, and has ever since roamed the Selick farm, making frequent excursions into the woods, but never failing to return.

But the star moose, and the pet of the show, is Tommy, the eight-months-old baby, which was brought by Mr. Leon A. Orcutt, of Ashland, in Aroostook county, Me. The little fellow was discovered not a hundred yards from the road, was secured with a rope, and readily consented to lead. Mr. Orcutt was bent on bringing his prize to Boston, but the law stood in the way, and the Game Commissioners are without authority to permit the taking of live game in close time except for public parks. Some genius discovered a way to solve the problem, by securing from the Commission a permit to hold the game and transport it to the Portland Park. Accordingly Tommy set out for Portland, and is now on his way thither by way of Boston, where he has a stop-over ticket good until the close of the Sportsmen's Show. Following the nature of many of the wildest creatures when they are met with kindness by man, Tommy became almost immediately as tame as Mary's lamb. In the Mechanics' Building, independent of woven wire caging, he holds one continuous levee the livelong day through, and is the recipient of fondling that bids fair to turn his foolish young head.

It was not to be expected that all the animals would stand the ordeal of transportation and confinement. The most serious loss has been of the Maine caribou, which was captured in the snow and forwarded to Boston without a sufficient supply of moss for food. Thursday afternoon, when it was manifestly sick beyond recovery, from fever and inanition, the managers humanely dispatched it. The next morning the skin was hung up on the drying scaffold in the Indian camp, and Louis Michel was at work upon it when one of FOREST AND STREAM's photographs was taken.

The most winsome creature in the show is the Rocky Mountain ewe. She would need only to be taken from her cage to show herself as confiding as the baby moose and as responsive to the friendly advances of the good people of Boston. As for the unhappy Rocky Mountain ram, with his cruelly deformed limbs, one may not look on him without compassion. The attendant gives out that the sheep was born crooked-legged; but it is probable that he was once straight of limb, and that the distortion of his legs is due to his having been penned

up for years without an opportunity to wear down the growth of hoof, which has resulted in curvature of the limbs. The ram is now the property of the Association; and we are grateful to know that upon the conclusion of the exposition Dr. Bishop, enlisting the co-operation of skilled surgeons, will put the crippled creature under the influence of ether, and perform the operation of tendonotomy, which is the severing of the tendons from their abnormal attachment to the integument. The operation is one which is attended with success in the human subject, and Dr. Bishop is sanguine that it may be performed not less successfully with the ram.

No single exhibit in the show is more instructive or more carefully studied than the excellent display of live game fish. Here one may see every variety of trout known to New England, and may observe their development from the ova to the big fellow of 6½lbs. As was told last week, Messrs. Bayard, Thayer and Richard O. Harding, who have in charge the live fish exhibit, have drawn upon the generous resources of the United States Fish Commission, the Maine and New Hampshire Commissions and the Plymouth Rock Trout Co. From the National Commission were brought the Atlantic and quinnat salmon, steelhead, Loch-Leven, rainbow, brook and hybrid aureolus trout, silver and golden tench, crappie and large- and small-mouth bass. Maine and New Hampshire contribute lake, rainbow and brook trout. The Plymouth Rock Trout Co. have in operation a set of hatching trays with 10,000 trout eggs in various stages of development, and in the troughs are 25,000 fry. The hatching trays are of the all-metal style, in which the wooden rims are dispensed with; and the troughs are equipped with the automatic aerator and feeder, an ingenious contrivance devised by Supt. C. C. Wood for feeding the fry and supplying them with currents of fresh water. Some tanks are devoted to an illustration of the variations of size of fish of same age. There are shown three different sizes each of fish one year old and two years old; the smaller of the two years old are not larger

than the largest of the one year old. The fish have all been reared in the same waters and fed in the same way with the same food. They vary in growth just as human beings do. It is impossible to determine from size alone the age of a trout. In other tanks is shown the decided difference in growth of artificially fed fish over others which have been left to shift for themselves on the natural food supply. Thus, all in all, the fish tanks afford an interesting series of object lessons.

Mr. Wood reports a growing business to meet a widening demand for trout eggs and fry for stocking purposes. The Plymouth Co. supply a number of States, which find it much cheaper to buy the fry than to maintain hatcheries. It would be economy for Massachusetts to adopt the plan; the Commonwealth could secure at Plymouth trout fry for a fraction of what it costs to provide them under the present expensive, antiquated and inefficient system.

The Indian camp, in the main hall or auditorium, has been constructed on a scale which makes it the central object of interest and the dominating feature of the entire exposition. It is an elaborate piece of stage setting, filling a space 52ft. in height by 84ft. wide, and having a depth of 95ft. from the lake to the back of the scene. The camp is laid out on the great stage against a background which is a triumph of the scenic artist's skill. In front lies a lake, on whose placid surface are mirrored camp and cliff and cloud; Indian canoes rest on the bank; just beyond are the bark tepees of Micmac and Mellicete; the camp-fire is burning; men and women are busied in their several tasks, cooking, dressing skins, mending canoes, fashioning spears; on one side romps a bear, on the other is tethered a pony. Back of the camp, in the center, rise beetling cliffs; on the left are mountains, with cascades falling down their precipitous sides, and summits lost in the clouds; on the right opens an enchanting vista of valley and winding river, with the tepees of an Indian encampment dimly seen in the distance. All in all, it is well done, admirable alike the beauty of the scene and the realism of the effect.

INDIAN SALMON SPEARING.

Louis Michell with the spear; Jim Paul at the paddle.

Photo for the Forest and Stream by N. L. Stebbins.

The Indian camp was designed and executed by Mr. L. W. Seavey, of New York, who did the other scenic decorations of the building, including the panoramic views of the Maine section. The Indians and the accessories of the camp were secured by Mr. Antonio Apache, the superintendent of this department. The tepees, the costumes and other details were designed by Mr. Apache after a careful study of the ancient ways of the tribes of this region as described in the Jesuit Relations and other early records.

The Indians are Micmacs and Mellicetes, and come from New Brunswick. The Micmacs, from Mission Point in Restigouche county, are Louis Michel and Peter Soule. The Mellicetes are Jim Paul, of Fredericton, for three years chief of the tribe; Newell Saules, and the boy Andy Sacobie, or Raccoon. Two of the three girls are daughters of Paul. All the men are inexperienced guides, hunters and canoe men; Michel is W. K. Van-

representation of the four important districts, the Rangeley Lakes, Dead River region, Mooshead Lake and the Aroostook country. The Maine camps and cabins have for their background panoramic paintings of familiar Maine scenes—Rangeley Lake, Round Mountain Lake, Mooshead Lake—a device which sets them off and gives a most pleasingly realistic effect.

Flagstaff and the lower Dead Lake region have sent Cliff and Warren Wing, James and Herman Harlow, and A. B. Douglass. They have their headquarters in a log camp, decorated with deer heads, skins, photographs of game, and other enticements, which so crowd the interior with visitors that one must take place in line to await his turn to enter. Mooshead Lake is represented by a strong delegation made up of Sam Cole, Charles Mercery, Ed Harlow, John Brown, Duncan Matthewson, Simon Mayo, H. Mansell and John Hall. With an effective panorama of Mooshead Lake and

THE most astonishing development of the whole show was this, that when Mr. Dimick was looking around for a practical fur trapper, to set up a trappers' camp, he should find his man within twenty-five miles of Boston. That a professional trapper should be carrying on his industry year after year here within hail of the Hub is surely a surprising phenomenon. Mr. John E. Stone is the Massachusetts trapper, and he sets his traps at Rockville on the Charles River. On Saturday, March 12, Mr. Stone turned out at 4 o'clock in the morning, made the round of his five-mile line of traps, gathered in seventeen muskrats, harnessed his horse, and by 12 o'clock was here in the building putting his camp to rights. "You may talk about horses being cheap," said he, "but you still have to pay good money for a good horse, as you always did. My colt cost me \$200, and when I started for Mechanics' Hall last Saturday I knew I would get here."

Everybody stops to look at the camp. There are

THE INDIAN CAMP LOOKING ACROSS THE LAKE.

Photo for the Forest and Stream by N. L. Stebbins.

derbilt's favorite guide on the Restigouche. The Indians are dressed, for this occasion only, in a style of deerskin clothing which Mr. Apache has determined was the costume worn by their people in the old days.

The lake—which, by the way, cost the Association thousands of dollars—is the theater of the afternoon and evening entertainments. Jim Paul comes down to the water's edge and calls for moose. Then he and Louis Michel launch their canoe and go salmon spearing; Michel is a born actor, playing the pantomime of his part so well that one almost sees the actual salmon fall into the canoe. From their traps set on the margin the Indians and John White, the Rockville trapper, take the catches of muskrats. On the shore a gunner whistles the calls of shore birds and others—yellow-leg, least sandpiper, spotted sandpiper, red-winged blackbird, meadowlark, hawk and crow. An angler plays a trout until it comes within reach of his Indian guide, and in a wink it is in the landing net. Swimming matches, canoe contests, log rolling; a dive by a man tied up in a bag, who falls from the rafters 70ft. above; another backward dive from the same height, with somersaults in mid-air—this is not by any means to catalogue the entire list of feats; but it indicates in some measure the wealth of entertainment provided for the amusement-seeking public.

If in this hall one looks up, he may see flocks of wildfowl flying over. There are 150 ducks, mallard, black, wood, pintail, redhead; and twenty-seven geese. It is a pretty conceit, but one is not likely to bestow a second glance on stuffed effigies, when there is such store of living birds and fowl to study. The wildfowl shown by Mr. Wilton Lockwood are a never failing delight; theirs is the real music of the show, and the gamut runs from the far-reaching clamor of the geese to the soft confidences exchanged by the black ducks in notes as unusual as the gurgle of water under the thin ice of a winter brook.

The Maine section is under the supervision of Dr. Heber Bishop, who has ample reason to be proud of the

Mt. Kineo as a background, a moose hunter's shelter has been set up, and numerous trophies are disposed about. Among them is the head of a 376lbs. deer, which Ed Harlow claims to be a record deer for Maine. A pair of snowshoes shown was made sixty years ago by Susan Tomah, of the Tarrantine tribe of the Penobscots. Susan is now eighty-six years old, and is still making snowshoes.

Eustis and the Dead River region are represented by Edgar Smith, Davis Moody, Dion Blackwell, Seth Payne, J. R. Adams, Robert Phillips, Ed Jones, Gus Jones, Al Large and Grant Fuller. Edgar Smith, who is the proprietor of the well-known Round Mountain Lake camps, reports that the game and fish supply is keeping up; the fish are as numerous as ever, and deer are on the increase, while the growing number of visitors shows that the Round Mountain Lakes are winning favor with woods lovers.

Capt. Charles F. Barker is here representing the country reached by the Portland and Rumford Falls, and Rumford Falls and Rangeley roads. No Maine man in Mechanics' Hall has a wider acquaintance with sportsmen and tourists, as one may learn from the hosts who greet him. With Capt. Barker is Cliff McKinney, of Auburn.

The Rangeley cabin is the same one which was set up in New York. The Rangeley guides are Ed Grant, Rube Crosby, Walter Twombly, Wilmot Patterson, Bert Herrick, Freeman Tibbetts, Dan Haywood (of Camp Caribou) and Jim Matthewson. W. E. Latty and Sergeant Grillat, of Megantic, P. Q., guides of the Megantic Club, make their headquarters with the Rangeley boys.

New Brunswick has set up the most elaborate local display in the show. It has a log cabin profusely decked with game heads and other trophies; and there is an interesting collection of mounted game, from the Crown Land Department. Fishery Commissioner D. G. Smith, Chief Game Commissioner Leonard B. Knight, C. Fred Chestnut, S. E. McDonald and others are here to give information about the hunting and fishing grounds of the Province.

boats, tents, guns, traps, green skins on the stretching boards, and a live fox in a chronic state of wonderment that there are so many human beings on the earth. The exhibit is most interesting in its illustration of the unsuspected trapping resources so near a great city. "There is more game to be had right here within twenty-five miles of Boston than in any place in Maine," Mr. Stone declared, "and there is more money to be made in trapping right here. But you may tell anybody who is thinking of trapping as a business that they would better let it alone. There is no money in it here nor anywhere else. I go to Lewis in the Adirondacks every fall to trap sable and bear. In 1896 I got three bears, seventeen mink and eight sable, and realized \$60 on the lot. In 1897 from my catch of eight mink and twenty-five sable I got \$57. That was all I took in for the whole season's work there; and I did better that year at Rockville, when in fourteen days I took three otters and minks and muskrats enough to net me \$53.75. But I don't trap for the money; I do it because I love it, and can afford to follow it.

"I began in 1858, when I was twenty years old; then I went to the war, and when I came home I was too busy carpentering. While I carpentered I carpentered hard. They used to say in our town that if anybody could do a thing John Stone could; and that if John Stone did it, it was done right. I didn't have any time to trap in those days, but I always said that when I got money enough—and I set a limit—I would quit carpentering and go to trapping. They laughed at me, and said I would not do any such thing; that men did not stop when they got to the first limit, but always made another one. That's so, too; there was John Blank, though I don't believe he ever did set any limit; anyhow he didn't stop this side of \$200,000, and when he'd got as far as that he was not good for anything, let alone trapping. Well, I made my limit, and then twelve years ago, just as I said I would, I stopped work and put out my line of traps, and I've run them every year since. I have a farm down at

Rockville, where the family live in summer, and I raise potatoes and other truck, and all the rest of the time my son and I have the house for our trapping headquarters. My son, eighteen years old, likes trapping as well as I do; he is tending the traps down at Rockville now, and sends me in the catch every day. I got that mink from him to-day. It's a good one, 32in. at least."

"Yes, you can stretch him to 34in. easy. I never saw anything like him, and I have trapped hundreds of mink," commented Warren Wing, who had come over from the Maine section.

"They grow bigger here near Boston than I have found them anywhere else," said Stone. "The salt water may have something to do with it. Besides minks and muskrats at Rockville we get skunks (although no trap-

Guise, who shows a full series of pheasants; Abbott M. Prazar, taxidermy; W. W. Hart & Co., taxidermy; Hazard Powder Co.; Hunter Arms Co.; Marlin Firearms Co.; C. B. Keller in charge; Plymouth Rock Trout Co.; William Reed & Sons, William R. Scott and Smith & Wesson.

Fishing in the Ohio River.

THE winter months have passed and spring has come, and many an angler's heart is glad and eager to take advantage of the opportunity for an early spring fishing trip. The run of the Ohio River fish is as follows: Jack salmon first, now running; will be over by the last of

Grand Rapids Fly-Casting.

GRAND RAPIDS, Mich., March 1.—The first tournament (open to the world) of the West Michigan Fly-Casting Association, under the auspices of the Game, Fish and Dog Protective Association, of Grand Rapids, Mich., will be held at Reed's Lake, near this city, on June 8 and 9.

This will be something new in this section, and from present indications we will have a very large attendance. We have a large number of enthusiastic sportsmen in this city.

The programme calls for fixed distance and accuracy fly-casting, accuracy bait casting, dry fly-casting for accuracy and delicacy, fly-casting for accuracy, bass fly-casting for distance and accuracy, long-distance

THE INDIAN CAMP FROM THE GALLERY.

Photo for the Forest and Stream by N. L. Stebbins.

per ought to make any account of the skunks he gets), an occasional fox who fastens himself into one of the traps, and coons and otters. There are more otters in this country than you'd think; but people who do not trap know little about these things. Why, I had an argument to-day with a man who said that beaver were exclusively cold country animals, and he wanted to tell me that they could not be found in the South, although I myself have trapped them in Mississippi. I was going to write something about that for FOREST AND STREAM.

"Our outfit consists of six bear traps, Newhouse No. 5, for the Adirondacks; twenty-two otter traps, and 180 traps, all of the same style, for mink, sable and skunk. We have four guns, a 10, a 16 and two 12-gauges; two tents and five boats; that is more boats than we need, but it is convenient to have them scattered along the river, and sometimes we can leave the boat and walk home, three miles, when it would be five or six to row around.

"Yes, I am more interested in trapping now than I ever was before. Its fascination seems to grow on me. A man came up this morning and said: 'Hello, John, you here?' I guess you are the only one left of all the tribe.' And I guess I am; I don't know of another regular trapper around this country. Of course the boys do something at it, but they don't amount to anything. As I said before, there is no money in the business; and then, you see, most men have not got sense to stop at the limit. They keep on piling up more money, when they might very well afford to knock off and go trapping."

In the Lynn Fish and Game Protective Association's handsome display of trophies, central place is given to Dr. Gray's magnificent moose head. It has a spread of 58½in., with web of 16½in. There are 39 points. The moose was killed with a Winchester .30-30, in 1896, at Mt. Katahdin, Me.

Among the trade exhibits are those of Verner de

the month, as it is a cold-water fish. Then follow the bass; these are the first fish you catch with pole and line, and are the first cold-water fish that run in the fall of the year. After the jack salmon and bass follow the shovel fish and chubs, running together. Catching chubs is very pretty fishing, and the first of the month you can see a thousand people, men, women and children, fishing for them along the river bank at the foot of Market street. They are clear of bone, and very fine eating, and about the size of a smelt, usually running 5 or 6in. in length. Then after the shovel fish and chubs follow the cat and perch, which are caught all the summer through. Then follow the buffalo; they are mostly caught on trout lines, although you catch them with the rod freely at times. Most any kind of bait can be used. The following are considered best: Minnows, worms, crawfish and beef.

LOUISVILLE, Ky

EUGENE B. DYE.

Salt-Water Fishermen's League.

Editor Forest and Stream:

Pursuant to a call a number of enthusiastic salt-water fishermen gathered at Leggett's Hotel on March 20 to discuss forming an association for protecting salt-water game fish, and preserving the fishing waters, by helping to enforce the existing laws, and those that follow, against illegal practices.

This organization, which promises to be the strongest one of its kind, is called the Protective League of Salt-Water Fishermen. The following officers were elected: H. Taxter, President; A. H. Baer, Vice-President; C. S. Derby, Secretary; D. T. Riley, Treasurer. The Board of Directors are T. Biedinger, A. W. Andrews, J. H. Meetier, C. J. Fowler, J. Sullivan.

All fishermen can join this league by paying the membership fee of \$1, which can be sent to the secretary. For further particulars address Charles S. Derby, Secretary, No. 27 Bridge street, New York city. C. S. D.

fly-casting. Six championship medals will be awarded as first prizes, and additional merchandise prizes will be given. Full official programmes will be sent by Eber Rice, secretary, Grand Rapids.

A Correction.

AN error which occurred in the advertisement of Mr. W. J. Cummins, of Bishop Auckland, Eng., who advertises fishing goods, demands correction. The copy from which the advertisement was set had been corrected in one or two places, and in being set the word "English" by mistake got into a line which should have read merely: "Special quotations to dealers." The error is an unfortunate one, as it is calculated to convey the impression that Mr. Cummins makes different prices to different nationalities, which is not the case. As printed in this week's issue the advertisement reads as it should.

Montana Wolves.

Mr. Miles Taylor, whom I met many years ago out in Kansas, has for some time been the secretary for Senator Mantle, of Montana, and now writes me from Washington that he anticipates a good trip in Montana again this year. He also sends me a few items of interest about that big State, among others a little cowboy story in which we get a touch of the old times. In this case a rancher by name of Charles Bannatyne, of Brighton, while riding along with some friends saw three wolves which had been feeding at a carcass near the road. Bannatyne told Oliver Valleaux, a cowpuncher, who was along, that he could not rope the wolves, and the latter thought he could. He roped the three in four throws of the rope, which is pretty good work for any cowpuncher.

Mr. Taylor hands me among other things a clipping showing the Montana wolf bounty for the month of February just past, which seems a bit startling. The total is \$5,268, covering 1,537 coyotes and 219 gray wolves. Custer county sent in 225 coyotes and 53 grays, more than any other county.

The Kennel.

Ethan Allin.

THE late Mr. Ethan Allin was well known throughout the New England States. He also had many warm friends in other portions of the country, especially in sections where ruffed grouse abound, for he was noted as an expert partridge hunter before I ever fired a gun. Early in his career he attempted to breed a strain of setters that would do satisfactory work on his favorite bird. How well he succeeded is a matter of history duly recorded in the sportsmen's publications of his day. He bred many dogs, but never enough to supply the demand. He never bred for color or form, and consequently his kennel always contained a varied collection, with scarcely two alike so far as looks went; but in the grouse covers looks, form and style nearly always had to take a back seat when competing with his dogs, for he succeeded in producing a strain that, with rarely an exception, handled their grouse in a most satisfactory manner. One of the first setter bitches that he bred from was Daniel Webster's Rachel, a worthless animal so far as hunting qualities go, but a well-bred one, as was abundantly proven by the performances of her numerous descendants.

In those days setters were very scarce, and he was forced to use the material that he could obtain, for there was not much opportunity to pick and choose. Many dogs of his earlier breeding were summarily disposed of when a trial found them lacking in the qualities that he was in search of, and only those that gave fair promise of usefulness were retained, and of these only the very best were used for breeding purposes. By pursuing this course a few years he succeeded in obtaining something approaching his ideal, but it was nearly a quarter of a century before he was perfectly satisfied with the results obtained. In the selection of dogs for breeding purposes, color and style had no part, nor did he discard a first-class performer for slight variation from the form he considered most desirable. Pedigree he cared very little for, and I have often heard him say that all the pedigree he wished was first-class work in the field. I have owned several dogs of his breeding, and have shot over scores of others, and with two or three exceptions all have been good performers, and many of them all that a sportsman could wish. While the partridge was his favorite bird, and his whole aim in breeding was to produce dogs that could do satisfactory work on them, nearly all of them were also excellent performers on other game. Although he best liked a small dog—one of about 40 lbs. weight—he often used larger animals for breeding, for the reason, as he often said, that good performance will cover a multitude of sins. His one rule in selecting his puppies was rigidly adhered to. Of course a malformed one met its fate at once, as also did some of the weaker ones of a too large litter. When the puppies were six to eight weeks old they were given a fair trial on game if it was practicable, and only those that showed pointing instinct were retained. I have repeatedly seen every puppy of a litter bred by him staunchly pointing the scent of a wing-broken grouse that he had brought home and pegged down in heavy grass or weeds, where they could not see it. In thus selecting his dogs all guesswork so far as their pointing was concerned was done away with, and there were no dogs to shoot for failure in this respect after they had arrived at maturity. He was very successful in rearing his puppies, rarely losing one from sickness of any kind, even including distemper, except that one year—1863, if I remember rightly—this disease made sad havoc in his kennel, sweeping off some thirty, both old and young. As a rule his dogs were healthy and vigorous, capable of working all day and every day during the season, always cheerful and obedient. They worked to the gun with scarcely an exception. Nearly all of them had lots of hunting sense, and many were exceptionally intelligent—just the dogs to please the market shooter.

Mr. Allin was opposed to inbreeding, but resorted to it in the absence of desirable animals of different blood. Some of his intercrosses were diametrically opposed to the rules laid down by the scientific breeder of the present time, but he was a firm believer in the old saying that "like will produce like," and in mating his dogs about his only care was to secure a pair that were alike in hunting qualities when in pursuit of his favorite bird. More than twenty years ago he bred a litter of puppies, and among them was a blue dog—not a blue belton in color, nor anything approaching it, but a solid blue, precisely the shade that is found in what is generally known as a Maltese cat. This color, although mentioned by English writers many years ago, had not previously been noted in this country, and the blue dog attracted a great deal of attention, and there was quite a controversy regarding the cause of the peculiar color. I believe, however, that all were finally agreed that the true solution of the matter was that the dog had thrown back to some remote ancestor of this color. Mr. Allin was a believer in this theory, and notwithstanding his professed disregard of pedigree it was plain to be seen that he took no little pride in the fact that this solution of the matter conclusively proved that a long and illustrious line of ancestors were behind his treasure. When I imparted to him my view upon the subject he reluctantly acknowledged that there was a strong probability that I was right, but requested me to keep silent upon the subject, as the learned savants who had decided the question might feel disposed to blame him for withholding important testimony that had entirely gone from him until I recalled it. The explanation—if it is the explanation—is very simple and at the same time deeply interesting, and for the first time I now make it public. When the dam of Fag, the blue dog in question, was in whelp I was at the home of Mr. Allin and saw her come into the kitchen where the old blue family cat had some kittens, but she did not tarry long, for the old cat lit on her back, and for about a minute it was cats and dogs, yowls and ki-yi's around that kitchen, when the dog, with the cat still clinging to her, darted through the door and disappeared around the corner. This little incident I believe to have been

the turning point for Fag, so far as the question of color is concerned, for when he came to light his color was identical with that of the cat. I may be all wrong in my conclusion, for I make no pretension to exact knowledge relative to interpreting the intricate problems that encompass the rules that govern, or the causes that affect or pertain to the pre-natal influence; so I merely jot down the incident together with my belief in the case, leaving to others more skilled in these matters to decide the question. I should perhaps add that Fag well earned in the field his right to a high place in the stud, and that he transmitted to his descendants not only his field qualities, but many of them he marked with his own peculiar color. I shall never forget the first time that Mr. Allin attempted to take Fag out shooting. Hon. E. H. Lathrop, Mr. H. J. Ferry and myself paid Mr. Allin a visit for the purpose of having the pleasure of a few days' sport with him among the birds. Mr. Lathrop had his well-known setter Dick and Mr. Ferry had his best dog, while I had the pointer Sensation and Rock, a capital setter of Mr. Allin's strain. A local friend who accompanied us also had a good one, and when we had them packed away in the wagon Mr. Allin loaded in three more, one of which was Fag, as he wished us to see how he would acquit himself when first shown game. Seating ourselves in the wagon, we started for a favorite range of covers some four miles away, but before we were out of sight of the house Fag showed signs of discontent, and an instant later he made a brave dash for liberty; but somehow he miscalculated his angles, for instead of making a straight shot he caromed against the front seat and then struck the hind wheel and dropped under it, and it went squarely over him just as it sank into a mud hole. Horror-struck, I leaped to the ground to gather up the mangled remains, and was never more surprised at anything of this nature than I was to see a streak of black and blue scooting across the open pasture and disappearing with a flying leap over the wall at the opposite side. When Mr. Allin told me some two years later that Fag was the best dog in the field that he had ever bred, I replied that this was to be expected, for five good men and seven good dogs had fairly ground it into him.

This day was most enjoyable; there was an abundance of birds, and the performance of the dogs was something to be long remembered. One incident in particular I shall never forget. We had flushed a bevy of quail that flew over a small knoll upon the summit of which was a small, dense patch of hazel. Dick was a short distance to the right of us, and Sensation was some twenty rods to the left, while the other dogs were at heel. When we were near the patch of hazel the dogs were sent on, and as they passed the patch nearly in a bunch they caught scent of a quail and simultaneously pointed, standing nearly in a semi-circle, with the two outside dogs not more than 10 ft. apart. I involuntarily gave the signal for a point, which instantly turned Dick and Sensation toward us. Dick came up behind the thicket and did not see the dogs until he was right among them, when he straightened out and drew into the only open place in the magic half circle and also pointed. Sensation was coming at speed, but as he topped a knoll some 50 yds. distant he caught sight of the dogs and at once backed in his very best style. Here were six dogs that a blanket would almost cover pointing a single bird. How long we stood there spellbound, gazing at the wonderful picture, I cannot say. Mr. Allin finally motioned for Mr. Lathrop to advance, which he did, and flushing the bird, killed it. I shall never forget the pleased look of satisfaction upon the countenance of Mr. Allin as he turned to me and said: "I have seen a great many wonderful pictures, but never one like that." We all agreed with him, and to one at least of that group, and I have no doubt to all, that beautiful living picture upon the hazel-crowned knoll will be a joy so long as life shall last. Mr. Allin was a quick shot and a very good one, and in addition to this he had a knowledge of the habits of game birds, especially of the grouse, that few possess. Some of his friends called him lucky in obtaining shots, but luck had nothing to do with it. He appeared to know almost intuitively just where the birds would go, and usually managed to be in that vicinity at the proper time. Mr. Allin was a very pleasant shooting companion, as is abundantly proven by the fact that his numerous friends returned each season for many years to enjoy the pleasure of his society for their days afiel. Many of these gentlemen are still living, and I feel assured that one and all will heartily join with me in tribute to the memory of our old-time friend—a true sportsman, a genial companion, and a steadfast friend.

SHADOW.

SPRINGFIELD, MASS., March 5.

English Bloodhound Club.

THE fourth annual meeting of the English Bloodhound Club was held at Madison Square Garden, New York, Feb. 22, at 3 o'clock P. M., Mr. J. L. Winchell presiding.

Dr. C. A. Lougest donated to the club a silver cup of the value of \$50, to be offered at such shows and under such conditions as the executive committee might think best. The club tendered a vote of thanks to Dr. Lougest for his generous gift.

The breeding of so-called American bloodhounds was discussed, and we decided to take no action upon the matter at present, but to leave it in the hands of the executive committee to take steps which they might think necessary to prevent the sale of American bloodhounds as bloodhounds.

The sum of \$50 was also subscribed by the members for a second club trophy to be offered at the leading shows.

The following officers were elected for the ensuing year: President, J. L. Winchell, Fairhaven, Vt.; Vice-President, C. A. Lougest, Boston, Mass.; Secretary and Treasurer, Charles H. Innes, Boston, Mass.; Executive Committee, the above officers, Roger D. Williams and Miss Nellie Lougest.

Dr. Alfred F. Stahl was elected a delegate to the American Kennel Club, and the following judges were recommended to the American Kennel Club: Dr. A. F. Stahl, Roger D. Williams, C. Walter Lougest and James Mortimer.

CHARLES H. INNES, Sec'y.

Yachting.

Now that the knockabout is an accomplished fact in New York waters, it is evident that if the best results are to follow from the establishment of what may easily be a handy, wholesome and generally useful type, some stringent regulations are necessary. The disposition at present is to class under the name "knockabout" anything that is not a Cape cat, and that cannot be squeezed in under the absurd and misused term of "rater," so that in a short time the name "knockabout" will probably be as meaningless and misleading as "rater," and the entire movement ruined by the invasion of racing machines.

It is only necessary to go back to the first Boston boats to find out what a knockabout should be; but what it is at the present time, in the popular mind, is a very different matter. Anything at all of greater out-of-water body than a "rater," and without a bowsprit, even though she be nothing more than some old centerboard sloop or cat made over, is now classed as a knockabout.

In view of the number of veritable knockabouts that will be included in the Sound racing fleet this season, even outside of the one-design class, the Indian Harbor Y. C. has taken steps to define the type and to provide open races for the class. We publish in another column the regulations drawn up by the regatta committee of the club for this purpose. These are in conformity with the rules of the Knockabout Association, of Boston, and will include every real knockabout.

It is a matter for regret that the whole subject of the knockabout type could not have been dealt with in advance by the Sound Y. R. A., the limits being set and arrangements made for the formal establishment of the class before any building was attempted. This, however, was not possible under the circumstances. In spite of its success in the East for several seasons, the type attracted little attention from New York yachtsmen until the end of last season, when all of a sudden the knockabout fever became violently epidemic. Outside of the Seawanhaka one-design class, which with its thirty-five boats will furnish plenty of racing for the members, there will be a large general fleet of knockabouts of different designs which can now enter the open races under the regulations laid down by the Indian Harbor Y. C.

We publish this week the conditions under which the new cup of the Quincy Y. C. is established. While open to international challenge, the cup is not dedicated exclusively to international competition, but may be competed for by yachts of any one nation without foreign challenge.

As far as international competition is concerned, the conditions are peculiar; the competition is limited to one class under a rule which exists nowhere but on Massachusetts Bay, and which produces a type of yacht radically different from those produced by the rules of Great Britain, France, Germany and the majority of American clubs. This type of yacht, with only the I.W.L. limited and sail untaxed, is now obsolete in France and Germany, where it was once as popular as in this country, and is found only in Australia and a few localities in the far East.

The cup is likely to serve a good end in promoting interclub racing on Massachusetts Bay; but it is almost impossible that under its present conditions it can ever attract a foreign challenge or become more than a local trophy.

There is very little likelihood of British or French yachtsmen attempting to challenge in a type of boat with which they are now entirely unfamiliar, and in which endeavor they could have no aid from the regular class racing in trials for the perfection of a challenger or for the defense of the cup, should they be so fortunate as to win it.

Another feature of the conditions that is hardly calculated to stimulate foreign challenges is the provision that after a foreign challenge has been received and a match arranged the defense may still accept challenges from home boats to an indefinite number. This idea of matching a fleet against one foreign boat was long ago abandoned even by the New York Y. C.; it is entirely at variance with modern ideas of fair sport, and of itself is enough to prevent foreign challenges. No intelligent yachtsman would to-day start out to challenge under a rule which compels him to build a peculiar type of boat with which he is unfamiliar, and in addition provided that his one boat may be opposed by an unlimited number of defending craft.

There is every indication that the cup will arouse and stimulate local interest in the 21 ft. class, and have a good effect on building and racing within the domain of the Y. R. A. of Massachusetts.

THE sale of the steam yacht Mayflower to the King of Belgium was recently recorded, and for several weeks the yacht has been lying at the Erie Basin with crew aboard and fires ready, awaiting orders to start. Last week the programme was materially changed by the sale of the vessel to the United States Government, and on Thursday she was taken to the Brooklyn Navy Yard, where she will be transformed into a torpedo boat destroyer. Mrs. Goelet boarded the yacht at the Erie Basin and made the trip up the East River on her; the end of Mayflower's brief career as a yacht. Within the past ten days, in view of the crisis in the affairs of Spain and Cuba, the representatives of the Government have been examining all the larger yachts with a view to their use in case of war. The Mayflower was not only far superior in speed to any other available, but the negotiations with her new purchaser were in such shape as to permit the canceling of the sale, which was immediately done, the Government purchasing her on the spot. The price paid for her is about the original cost exclusive of her costly and elaborate furnishing.

MR. HOWARD GOULD, owner of the new Niagara II., now approaching completion at Harlan & Hollingsworth's yard, has offered the yacht to the Naval Reserve of the State of New York in case of war, and the

offer has been accepted by Commander Miller. Should the occasion arise, the yacht will be finished as a war vessel, the original plans being changed accordingly.

Memories of Boating Days.

(Continued from page 234.)

During the summer of 1886 we sometimes discussed the advisability of making a cruise. But although many hot arguments were had, all hands seemed to have different ideas about where we should go. Our steward favored a trip around Long Island or down the Jersey coast to the Delaware. The captain thought nothing short of a run east as far as the Bay of Fundy would be worth while thinking about. I held forth on the beauties of the Hudson River, and said that a cruise up that stream as far as Albany and back would be a dream; the remaining member of our crew didn't care where we went, but said he would cast his lot with me.

As the captain and cook held out, a cruise was apparently abandoned. A compromise was effected by agreeing to take the boat around to the Sound and keep her there for a month or two in order to have a change of some kind. Accordingly one fine morning we said good-by to Sheephead and sailed away. We went up through the Narrows, the Upper Bay and East River, and arrived at Oak Point (where we had already made arrangements to have her cared for during our absence at business) about 5 o'clock P. M. Having moored her safely in the offing and returned on shore in the dinghy, we took the little steamer which ran from here to Harlem and started for home, congratulating ourselves that the move we had made was a brilliant one. And so it was to be, for two members of the crew.

On the way to the bridge the party who had decided to cast his lot with me, and whose name was Al, rode

"Al Lowered the Watermelon."

with me, and we plotted and schemed together, the result being that a week later, having arranged to take our vacations simultaneously, we left home one Monday morning, leaving the impression behind that we were to make a railroad trip to Albany. Instead we made a railroad trip to Oak Point. I will not go into the details of the little cruise that resulted. We went down the Sound as far as Stamford, visiting a few places on the way there and back, and had a most enjoyable time.

The following is a copy of the log, which was written at the end of each day:

Oak Point, Monday, Aug. 2, 1886.—Arrived at the boat 10:45 A. M.; waited until 2:30 P. M., when we had on board friends W. L., M. T. and J. L. We got under way and started off with wind S.S.W. out by Fort Schuyler and headed for City Island. Blowing hard as we passed Execution Light; put in single reef. Arrived off Glen Island 6 P. M.; tied up at old pier near chain ferry, which crosses from New Rochelle to the island. J. returned home on steamer, W. and M. have decided to stay another day; visited the island during the evening; 10:30 P. M. turn in, douse the glim. Al and W. take first watch.

Tuesday, 3d.—Al woke M. and me at 2:30 A. M.; we turned out and they turned in. Al and W. snoring, M. and I shivering; wind blowing hard 3:30 A. M.; don't like this watching business. Went below and turned in 5:30 A. M.; got up, washed down deck and had breakfast. W. and M. went on shore for a stroll; Al and I washed dishes. When they returned we went to look for a grocery store. Took wrong road coming back. Young woman directed us right. Went to Glen Island again; came back, had dinner. Bill of fare, steak, fried potatoes, stewed tomatoes, pickles, coffee, bread and butter. Dessert, hot punch and cigars. After dinner played accordion, sang songs, took a sail out around the island and back. W. and M. went home; furled up sails; 9:30 turn in.

Wednesday, 4th.—Laid in some more provisions; left New Rochelle at 10:15 A. M.; wind light; pleasant run to Oriental Grove, where a large steam yacht lay at her pier. Her name was the Orienta. Ran alongside and climbed on to dock; asked for captain, who presently came on deck; asked him questions about our course, which he cheerfully answered; chatted with us for half an hour; seemed quite interested in our venture. Started off again. Off Rye Beach we saw the remains of a steamer called the Capitol City, which had been wrecked here.

Near Captain's Island it began to shower. Two young ladies, who were rowing, asked us to tow them ashore. Took them on board and shortly afterward landed them at a place called the Cliff House; said they were stopping there; profuse in their thanks; gave them a salute from our cannon as we bore away. Missed the entrance to Port Chester, if there is any; came to anchor in a small basin inclosed on three sides by high cliffs. A gang of men were quarrying stone, which was being loaded on to some schooners lying close to shore. Cooked dinner. A boy came alongside in a skiff and watched us eat. Got rid of him by sending him on a fool's errand. While he was gone we left the place.

A short sail and we arrived at Indian Harbor, Greenwich, Conn. Cleaned up and went on shore, visited the town, and on way back purchased a water melon. Arriving at the wharf found the tide had fallen so low that Monaitpee was sitting in the mud and listing to port and away from the pier. I managed to get down on board and throw a rope to Al, and he lowered the water melon and then climbed down himself.

Had a hard job cooking supper; took an hour; required two to eat it. Sat in the cockpit singing, playing accordion (until a voice from shore said, "Stop it") and eating water melon. Boat floated about 11 o'clock and we decide to turn in.

Thursday, 5th.—Awoke at 6 A. M.; weather fine. Al posted letters. I cooked breakfast. Got away just in time to prevent grounding again. Very light breeze. Saluted cruising yachts as we passed out of the harbor. Arrived off Stamford. Decided not to land, but to start on our return. Must be home Sunday, and wish to stop here and there on our way. Wind fell flat, and in three hours made but five miles. Then a breeze sprang up and made things lively. Looks stormy to the westward. Raining hard. Lee deck awash. Donned oil clothes and settled down for an exciting sail; had it; put into New Rochelle again shortly after dark; scraped the bark off the pier as we luffed up alongside of it. No harm done. Moored the yacht with the rain coming down in torrents. Glad to get in here, where it is quite comfortable since we got the stove going. Rather be where we are than out on the Sound. Supper tasted good to-night. We are getting fierce appetites.

Friday, 6th.—Still raining when we got up this morning, but cleared up at 8 o'clock. At 9 we set sail and started out to look for a place called Pea Island, which we had been recommended to visit. Must have lost our bearings; could not find it.

Started across the Sound toward Long Island, and arrived off Sands Point after an hour's sail. We landed on the beach near the lighthouse, and spent three hours idling about the locality. Went on board and proceeded on our way. A short distance further on we fell in with an excursion from Brooklyn, landed at the grove and had a good time. Met several friends; took four of them out for a sail. They were very curious, and the two ladies couldn't imagine how we could exist on such a little boat. Got back just in time to get them on the barge before it left. As the tug puffed away with its gay party we discharged our Long Tom as a good-by.

Headed homeward once more. Looks squally. Fell in with a yacht flying Knickerbocker Y. C. flag, and kept company with her for some time. After passing Fort Schuyler we attempted to cook supper, but the Sound steamers passing out made such a disturbance that we could not keep the oil stove going. About sundown we rounded up at Oak Point with a ringing discharge from our howitzer on the forward deck. An extra charge had been put into it for this occasion, and as she belched forth the breech rope that held it to the bitts parted and it came within an inch of going overboard. The little Harlem steamer gave us an answer of three blasts from her whistle and we dropped anchor very well satisfied with our little trip.

The following summer we met with an accident, which came very near ending the career of Monaitpee as well as that of two of the crew and a friend. Two weeks previous to this incident we made a visit to Red Bank, on the North Shrewsbury River, and instead of returning to Sheephead Bay went to Bay Ridge in order to accept a challenge we had received to race a sloop named Lizzie. We sailed the race July 10, the first and only race our boat ever participated in up to the day we sold her. The course was a triangular one, starting from the foot of Twenty-seventh street, Bay Ridge, around Fort Lafayette, off Fort Hamilton, thence around the buoy off Robbin's Reef and home.

The result was as much a surprise to ourselves as it was to the crew of Lizzie. In a fine whole sail breeze Monaitpee took the lead at the start and when we crossed the finish line our opponent and challenger was rounding the mark at Robbin's Reef. Twenty-five minutes later she finished with the first blasts of a thunder squall to help her along. On the run home before the wind she carried a large spinnaker in addition to her ordinary canvas. Monaitpee used only mainsail and jib throughout the race.

We got our flags, and on Sunday, 17th, the cook, a friend named Dick Clark and myself started to take the boat back to the bay. The wind was very light when we started and soon died out entirely. The heat was intense, and while drifting in Gravesend Bay we undressed and jumping overboard swam alongside for a half hour. About noon time we were jogging along off Coney Island, having picked up a little breeze. We had just passed the Oriental Hotel and were about a mile and a half off shore, when on looking back I saw a great cloud of dust enveloping West Brighton. We had noticed some time before that there were indications of a thunderstorm in the northwest, and when the little breeze came along we set the clubtopsail, hoping to

get into the bay before it arrived.

From all appearances it looked as though there would at least a half hour elapse before it reached us, and on glancing back toward the island and seeing the tremendous cloud of dust and sand I cried out that there must have been an explosion at the beach. The words had barely been uttered when I realized that the storm was upon us. I never saw a squall approach more rapidly. It was a cyclone, and came hissing and howling across the water with the speed of a locomotive, and driving a wall of foam before it. To get sail off in the quickest possible time was our one thought. The first gust struck as we were hauling down the topsail. The boat heeled to the blow, and the wind catching the topsail, which was all adrift, forced it through between the backstay and the topmast. The club caught on the spreader, and in trying to get it clear the downhaul pulled out of the sail, and there was our kite bellied out like a balloon and no way to get it down without going aloft. The yacht was driving before the storm at a terrific rate by this time. We hauled down the jib and mainsail, having to jump on the hoops to lower the latter.

Taking a knife, I started to climb the mast to cut the topsail loose, but before I reached the spreader the full force of the gale struck broadside on. It was almost pitch dark; a terrific whirlwind of sand and hail stones accompanied the onslaught. I felt the boat going over and I quickly slid down to the deck; reached the cockpit, into which the water was already pouring and added my strength to that of the cook in trying to pay her off. It was useless; she paid no more attention to the rudder than if it had been a match. We tore off all our clothes and fastened the doors, and locking those doors I believe saved our lives.

Monaitpee died hard; she did not capsize, as most boats do; she was literally jammed over flat on the water by the strength of the screaming blast. We had sufficient time to prepare ourselves and secure a firm hold before she finally lay broad on her beam ends half under water, and every wave making a clean breach over her. Her toomast was visible and the topsail still clinging to it, dragging in the water. We clung desperately to the long oar which had been lying on deck with a vague hope that it might be of service in helping to sustain us in case the boat sank and we should have to take to the water. The cook and I could swim, but Dick could not.

We fully expected the yacht to sink, as she was heavily ballasted, and as she kept settling lower and lower we figured that she could not float more than ten or fifteen minutes. We arranged with Dick that when she went down he should cling to the middle of the oar and we would each take an end and do our best to keep him and ourselves above water. While we made this plan we knew in our own hearts that we could not hold out in such a smother of foam five minutes, but we could not bring ourselves to acknowledge that such was the case.

We sat in a line astraddle of the boat, with one leg in-

"They Dashed against Us and Flung their Spray 25ft. Beyond."

side the cockpit coaming and the other hanging over the rail, and clinging on with a death grip in order to resist the force of the seas that nearly choked us as they dashed against us and flung their spray 25ft. beyond.

For an hour we clung to our slowly settling craft, expecting each moment to feel her drop from under us. By this time she was so low that every wave hid her from sight as it dashed over us. We were blue with the cold and almost exhausted. The part on which we sat suddenly settled down. We felt our end was near, and shook hands. Not a word was said, and I guess each of us was occupied with such a multiplicity of thoughts of our own that words were forgotten. Poor Dick was a pitiful sight as he gasped and sputtered between each surge, and set his teeth and took a fresh hold to withstand the next.

As the stern of the boat sank I suddenly cried to my companions to move forward toward the bow. They did so, hitching themselves along laboriously, while I followed. It had the effect I hoped for. The after part slowly rose to the surface, and we managed to keep her balanced in this way for some time, until presently we saw with joy that the storm was abating.

It stopped almost as suddenly as it began. Fifteen minutes after it broke the sun was shining and the surface of the water was almost as smooth as glass. When we could see for any distance we strained our eyes, vainly looking for some craft to which we might signal for help. Not a boat was in sight. A moment later, while gazing toward Manhattan Beach, which was now nearly three miles away, I perceived what appeared to be a rowboat heading toward us; and such it turned out to be. It seemed an age before it was within hailing distance. When it finally came up we were busily occupied in playing a sort of see-saw on Monaitpee in order to keep our heads above water.

We found out on reaching shore that the captain of the Manhattan Beach Life-Saving Station had been watching us through his glasses at the moment the squall struck, and perceiving we were in trouble, imme-

diately set about getting a crew to man the lifeboat. At this season of the year his men were all home at their various occupations, as the Government only considers it necessary to keep the full complement during eight months of the year. So Capt. Rider had to run all the way to Manhattan Beach bathing pavilion before he found assistance. By that time the storm was at its height, and not being able to get enough experienced men to man the large boat, he was compelled to wait until the gale had spent its fury, and then send a smaller one.

Cold, wet and bedraggled, bareheaded and barefooted, we crawled on shore, while several hundred people who had sought shelter under the roof of the bathing pavilion gazed at us curiously as the captain hurried us off toward the station. Arriving there, some spirits was given to us, which we gratefully swallowed. Dry clothing and a hot meal, prepared by the captain's wife and daughter, put new life into us. Had we been in our own homes nothing more could have been done to make us comfortable than was done by Capt. Rider and his wife.

During the afternoon we speculated as to the fate of Monaitipee; and shortly before dark, accompanied by the captain, we rowed down the bay to see if we could obtain any news of her. We found more than news of her. We found the boat, at least what was visible of her. In the mouth of the creek which empties into Dead Horse Channel and directly opposite the Government Cut we came upon her. Two men were standing on the bank near her, and a block and fall had been made fast to the masthead and to an anchor which was hooked into the mud, some twenty odd feet from the water. Only her mast and rigging could be seen. The men gave us the following account of how she came to be thus situated.

After we had been taken off she had drifted with the incoming tide on to the bar which stretches out between Point Breeze Inlet and Dead Horse Channel. Here they found her, and as the tide rose she floated across into the channel, and making fast a line to her, they guided her, with the aid of a rowboat, to the mouth of this creek. When they put the fall on to right her up the cabin doors came open as they emerged, and the air that had been confined within escaped, and she immediately sank to the bottom.

The next day she was raised in this way. At low tide there was only 2 or 3 ft. of water in the creek, and when the boat was exposed it was an easy matter to pump and bail her out, so that she floated on the return of the tide. There was very little damage done to anything except our clothing, and in a few days she was looking as sleek as ever. The men who towed her in were rewarded, and once more we were in shape for further adventures.

The Quincy Y. C. Challenge Cup.

The Quincy Yacht Club Challenge Cup Offered by the Quincy Yacht Club, of Quincy, Mass., U. S. A., to Promote Small Yacht Racing.

DECLARATION OF TRUST.

This instrument, dated Feb. 14, 1898, made by the Quincy Yacht Club, a corporation duly organized under the laws of the Commonwealth of Massachusetts, witnesseth as follows:

The Quincy Yacht Club, having offered a perpetual challenge cup, to be known as the Quincy Yacht Club Challenge Cup, for the purpose of promoting small yacht racing, hereby declares the conditions which shall govern the tenure of the said cup and the competitions therefor.

ARTICLE I.

Contests shall be open to yachts of any country, representing any organized yacht club in good standing, provided the sailing length, measured by the rule of the Yacht Racing Association of Massachusetts, is 21ft. or less.

ARTICLE II.

The club holding the cup shall defend it between July 15 and Sept. 15 against all comers. All challenges shall be in writing, signed by the proper officers of the challenging club. To insure a contest, one challenge must be delivered by April 1. Subsequently other clubs may challenge and enter the same contest on the terms proposed in the challenge first received and accepted; but no challenge will be accepted if received after May 15.

ARTICLE III.

A contest shall consist of a series of races. Each club shall name its representative yacht for the series before the day of the first race.

Yachts must be measured previous to any contest. When the cup is held by a club which is a member of the Yacht Racing Association of Massachusetts, the measurer shall be the official measurer of the Yacht Racing Association of Massachusetts. When the cup is held by any other club, the measurer shall be the official measurer of that club.

ARTICLE IV.

A yacht must win three races of a series to win the cup. After four races of any series have been sailed, only winners of at least one race shall be allowed to compete; after six races, only yachts which have won two races.

ARTICLE V.

Races shall be sailed under the rules of the Yacht Racing Association of Massachusetts, with the further provision that the total weight of a crew, in racing trim on day of race, shall not exceed 850lbs.

ARTICLE VI.

The courses shall be laid as nearly as possible as follows:

The first race to windward or leeward and return. The second race a triangle, of which at least one-third shall be to windward. Subsequent races shall alternate as above until the series is finished. A change of wind after the start shall not invalidate a race. The length of course shall be not less than nine nor more than twelve nautical miles. The depth of water over the whole

course at the time of start, and for four hours thereafter, shall be not less than 5½ft.

ARTICLE VII.

The terms of this instrument may be modified by the Quincy Yacht Club while the cup is in its possession, and when not in its possession, by agreement between the Quincy Yacht Club and the club holding the cup; but no modification shall be made during the pendency of any challenge, unless consented to by all challengers.

ARTICLE VIII.

All conditions of any competition not covered by these articles or by the rules of the Yacht Racing Association of Massachusetts shall be left to mutual agreement, and in case of failure to agree, the executive committee of the Yacht Racing Association of Massachusetts shall act as arbitrator.

ARTICLE IX.

When a club has won a contest, said club shall be made custodian of the cup, after having deposited with the Quincy Yacht Club a satisfactory bond for the safety of the cup.

The cup shall be held by the winning club in trust, subject to the terms of this instrument.

If said club dissolves or ceases to exist, the cup shall be returned to the Quincy Yacht Club.

In witness whereof the Quincy Yacht Club has caused

TROPHY FOR DOVER—HELGOLAND RACE OF 1898.
Designed by the Emperor of Germany.

its corporate name to be signed hereto by its commodore, and its corporate seal to be hereunto affixed and attested by its secretary, all done in duplicate originals as of Feb. 14, 1898.

FRED B. RICE, Com.
JAMES S. WHITING, Sec'y,
76 High Street, Boston.

Extracts from the Rules of the Yacht Racing Association of Massachusetts, February, 1898.

RULE VI.

Racing Length.

The measurement of racing length shall be obtained as follows:

1. The racing length shall be the distance in a straight line between the furthest point forward and the furthest point aft, where the hull exclusive of the rudder or rudder post is intersected by the surface of the water, when the yacht is afloat in smooth water and in racing trim.

2. The maximum number of crew and weight of ballast which the owner elects to carry in any race shall be on board at time of measurement.

3. The weight of the crew shall average 150lbs. for each person, which may be substituted by dead weight, and shall be placed amidships at the point of the greatest beam at the waterline, or in such position as to place the yacht in racing trim, as directed by the measurer.

4. The ballast shall be fixed and in its proper position.

5. The centerboard shall be up.

6. All racing spars, sails, rigging and racing truck, and at least one anchor and cable, and such other articles as are needed for ordinary sailing, shall be on board and placed where they are usually stowed when not in actual use.

7. A yacht altering her trim so as to increase her racing length must immediately notify the secretary of the Association, or judges, and obtain a new measurement.

RULE IX.

Crew.

1. The total number of persons on board a yacht shall

not exceed the following: 21ft. classes, five persons.

2. No one shall join or leave a yacht after the start, except in case of accident, or injury to a person on board.

Knockabout Rules for New York.

The following restrictions have been drawn up by the regatta committee of the Indian Harbor Y. C. to govern the racing of knockabouts in the open races which the club proposes to give during the season:

Definition.

A boat of this class is intended to be a seaworthy boat, with cabin house and fair accommodations, with watertight standing room, or air tanks of sufficient capacity to float the boat when full of water. Rigged simply with only mainsail, forestaysail or jib and spinnaker.

Length L.W.L.

The length of the load waterline, with full equipment, shall not exceed 21ft.

Beam L.W.L.

The beam at the load waterline in keel boats shall be at least 7ft., and in centerboard boats at least 7ft. 9in.

Freeboard and House.

The freeboard shall be not less than 20in. on the said respective required beams; a reduction of 1in. on the freeboard allowed for every increase of 4in. in beam respectively.

The cabin house shall have a length of at least 7ft., and a width equal to 60 per cent. of the greatest beam on deck, a height at the forward end of at least 6½in., and at the after end of at least 9in. above the deck; provided, that in case the freeboard exceeds the requirements, such excess may be deducted from the required height of the cabin house.

Ballast and Draft.

For centerboard boats the draft shall be not less than 3ft. for at least 5ft. length of keel; the total outside fixed ballast shall be not less than 3,000lbs. For keel boats the draft shall not exceed 6ft.; the outside ballast shall be not less than 3,500lbs.

Certificate of weight of ballast shall be furnished the measurer by designer and builder. The fin shall not be counted in the required weight of ballast, and no fin shall be less than ½in. in thickness.

Scantlings, Planking and Construction.

The keel, stem, frames, house and deck beams shall be of oak, or its equivalent in strength.

The frames shall be not less than 1sq.in., deck beams not less than 1 1-3sq.in., section, house beams not less than ¾ of a square inch section.

The spacing of frames, deck and house beams to be not more than 9in., center to center.

The planking, including deck and the side of house, shall be not less than ¾in. thick; the top of house shall be not less than ½in., finished.

Deck clamps shall run from stem to stern, with a minimum cross section of 4sq.in. for at least one-half the length; also bilge stringers of at least 4sq.in. cross section shall run for at least one-half the extreme length of the boat, amidships. Clamps and stringers to be of yellow pine or its equivalent in strength.

Sails.

The actual sail area shall be not over 600sq.ft., and not over 480sq.ft. of actual sail area shall be in the mainsail. The measurer shall be provided with a correct sail plan of any boat to be measured, and previous to measurement the owner shall cause distinguishing marks, satisfactory to the measurer, to be placed on the spars as follows:

On the mast at the tack, and at the throat of the mainsail; on the boom at the clew of the mainsail; on the gaff at the peak of the mainsail. No part of the mainsail shall be allowed to extend beyond these marks. The marks shall be black bands painted around the spars in a manner satisfactory to the measurer. The inner edge of the bands shall be the limits of the sail.

The actual area of the jib shall be measured.

The extreme distance in feet from mast to end of spinnaker boom when in position as used shall be not more than 400 divided by the distance in feet from deck to throat of spinnaker halyard block.

No battens over 30in. in length allowed to be used in sails.

Equipment.

Equipment to include anchor not less than 25lbs., and cable of not less than 30 fathoms of 1½in. rope; also bucket, pump, compass, fog horn, boat hook, lead and line, lantern and three life preservers.

Crew.

The crew is limited to three persons, including the helmsman (who must be an amateur); not more than one shall be a professional.

Other Boats Accepted.

All boats now existing that have been accepted by the Knockabout Association under previous rules, and all boats now existing, or in the process of construction, that comply with the present rule of the Beverly Yacht Club, shall be accepted as complying with these rules, and may carry sail in accordance with these restrictions; and all boats built on the lines and specifications of W. B. Stearns, as accepted by the Seawanhaka Corinthian Yacht Club, and carrying not more than 550ft. of sail, shall be accepted as complying with these restrictions.

Dover-Helgoland, 1898.

For the second time the Emperor of Germany has given a handsome cup for a race from Dover to Helgoland, open to cruising yachts of fifty tons, Thames measurement, and over. The cup here illustrated was designed by the Emperor, a handsome loving cup, standing over 2ft. high; it was made by Werner, the Berlin silversmith. The committee appointed by the Emperor is charged with the definition of a cruiser and with the arrangement of the handicaps; the race starting from Dover on June 20.

The Fin-Keel and Scow Types.

NEW YORK, March 8.—*Editor Forest and Stream:* In the issue of Jan. 1, 1898, I promised Fin (de siecle) to submit a suggestion for a yacht for the new L. Y. R. A. 22ft. fin-keel class. I submit herewith two designs, and with your kind permission will use them to illustrate a point or two in connection with measurement rules. [Refer to FOREST AND STREAM, issues Nov. 20, 1897, article by A. on measurement, S. C. Y. C. 21ft. knockabout; Dec. 18, 1897, communication from Fin (de siecle); Jan. 1, 1898, American Y. C., 25ft. knockabout, and my communication; Jan. 22, S. C. Y. C. race committee report; Feb. 5, communication from Sextant; Feb. 12, communication from Mr. James N. Warrington and C.; Feb. 19, plans for 25ft. fin-keel cruiser; March 5, communication from Mr. Mills.]

The S. C. Y. C. 21-footer is of the conventional keel

yachts. It would surely be natural to expect that the requirement of so large a midship section would produce a good type of yacht, and yet the Freak is the fastest model of the three submitted, and differs but little from the successful 20 of last year. The displacement factor is very small, and the scantling which the Lake rules require utterly insufficient to produce a strong boat. Indeed, without a very complete system of trussing the Freak would break up inside of a month, and yet she would comply with the rules made for the express purpose of producing a strong-built yacht of a good, wholesome form. Not only is this true, but the Lake rules permit this same form to be built minus the keel to race in the regular classes, unless I am misinformed, the only change required being the addition of a center-board trunk and two rudders like those shown by dotted lines at each quarter.

The righting moment, lateral plane, etc., are all right,

0.56 will give the cubic displacement of hull, the 0.53 being used for a yacht of fine lines and the 0.56 for one of full lines. Observe in the table how erroneous this is. Another assumption is a ratio existing between erect and actual L.W.L. This too is entirely wrong, since the designer can make as great a difference as he chooses, practically.

I hope you will get or write an answer to C.'s communication of Feb. 12, or else either show the possibility

Body Plan of L. Y. R. A. Design.

of beating the rule above outlined, or suggest a better one to secure a "speedy, seaworthy and comfortable yacht;" and I will make good my word and send you a design that shall be only speedy.

The daily papers publish Mr. F. B. Jones' definition of a 21ft. knockabout. Taking this definition, it is easy to design a yacht without accommodation, of 5,500lbs. displacement, flush deck, sailing on a L.W.L. of 30ft. and a beam of 5ft., and a yacht that will carry whole sail when the regular knockabout must be close reefed. Compare with Table 1. The English girth rule permits of the design of a yacht, say of 44ft. rating, carrying 3,600sq.ft.

Body Plan of "Freak."

of sail, with a large relative righting moment and a midship section coefficient of 22 per cent. This means that if better yachts are being built in England, it is only because the designers don't care to take advantage of their opportunities.

To sum up:

1. Length should be measured when the yacht is heeled.
2. Size can only be secured by a requirement of cube or displacement.
3. If sufficient displacement is required, nothing can be gained by skinning construction, except increased ability to carry sail.
4. Ability to carry sail is a function of ballast, beam and draft to a reasonable figure, and beam will be limited by the length naturally, but in any case is good per se.

GEO. HILL.

Long Island Sound Y. R. A.

THE annual meeting of the Long Island Sound Y. R. A. was held at the Fifth Avenue Hotel, New York, on Monday, March 21, with President Cromwell in the chair, the following delegates being present:

Corinthian Fleet, of New Rochelle, W. P. Stephens; Hempstead Harbor Y. C., Ward Dickson; Horseshoe Harbor Y. C., F. E. Towle, Jr., and J. M. Price; Huntington Harbor Y. C., H. H. Gordon; Huguenot Y. C., E. Burton Hart, Jr.; Indian Harbor Y. C., F. Bowne Jones and Charles E. McManus; Knickerbocker Y. C., O. H. Chellborg and H. Stephenson; New Rochelle Y. C., Paul A. Meyrowitz; Park City Y. C., Rodney S. Bassett; Riverside Y. C., C. T. Pierce and George B. Clark; Seawanhaka Corinthian Y. C., Oliver E. Cromwell; Douglaston Y. C., O. H. Chellborg (representing W. A. McLellan); Harlem Y. C., W. A. Towner; Sachem's Head Y. C., R. C. Mitchell.

The report of the executive committee was read, recommending that time allowance be continued for the present season, and that a new arrangement of starting signals, with separate starts for the special classes, be made; also presenting a schedule of dates substantially the same as in 1897. The report was adopted.

A motion was made and carried that time allowance be continued for the present year.

Some discussion took place on the subject of starting signals, and Mr. E. Burton Hart, Jr., suggested the adoption of a code of nine instead of six signals, with a series of six balls in combination, giving nine divisions. This proposal was adopted, the details of the arrangement being left to the executive committee.

After discussion it was decided to race the cabin and open boats in separate classes, and the definition of a cabin yacht framed last fall by the Y. R. A. of Massachusetts was adopted as follows:

Definition of a Cabin Yacht.

A cabin yacht shall be defined as either a flush-decked yacht with cabin accommodations below deck, or a decked yacht with cabin trunk and similar accommodations, which shall conform to the following limitations:

1. The least freeboard shall be equal to 7 per cent. of the L.W.L. length, measured in a perpendicular line from the top of covering board of deck to the surface of the water.
2. The cabin shall have headroom over the required floor space, equal to not less than 18 per cent. of the L.W.L. length, to the limit of 6ft., in the clear, under deck or cabin trunk, exclusive of skylights and hatches, with substantial partition at the after end of the cabin; and shall have a floor above the timbers, flush throughout, excepting the space occupied by the centerboard box, for at least 35 per cent. of the L.W.L. length, with a minimum width of not less than 20 per cent. of the extreme beam, and shall be fitted with two permanent lockers, and suitable berths for the accommodation of the crew.
3. A cabin trunk shall be capable of sustaining the weight of the entire crew.

type, and comes quite close to the restrictions of the Lake 22ft. class, and the American keel and my fin come quite close together, and so I have compared some of the features in the table herewith submitted.

In the matter of room the designs speak for themselves; in the matter of speed they can be compared by the application of the following rules, each rule being understood to be relative:

1. Sail area alone produces motion, therefore the larger the sail area the faster the motion.
2. Sails should be as near theoretical planes as possible.
3. The length that exists under sailing conditions should be as great as possible and the breadth as small as possible.
4. The wetted surface should be as small as possible.
5. The lateral plane should be as much of a plane as possible.
6. The rudder should control the yacht's motion posi-

PROPOSED L. Y. R. A. DESIGN.

tively by directing it, not negatively by dragging back on one side.

7. The hull should be practically symmetrical about an axis parallel with the keel under all angles of heel. Any change in form when heeled should be an improvement.

8. The rate of displacement of the particles of water in a path at right angles to the keel should be as slow as possible.

9. The center of buoyancy should be separated as far as possible from the center of gravity.

10. The center of buoyancy, center of gravity, center of load waterline length, center of lateral resistance and

C. are right in saying, classify for sail area alone. If the S. C. Y. C. race committee and A. and C. express the views of American yachtsmen, that we want a rule to develop a "speedy, seaworthy and comfortable yacht," then the rule proposed by C., with a limit of draft added, is ideal. Make it read: "Yachts shall be classified according to sail area."

In each class, sail area, load waterline and displacement, when heeled until deck amidship is even with the water, and draft when on an even keel, shall be fixed. All dimensions shall be taken from the plans of the yacht by the designer and sent to the measurer or secretary of the club, with the affidavit of the designer that

PROPOSED "FREAK."

center of effort should all be in the same vertical transverse plane.

11. The entrance and run should be the same.
12. There should be no angles, pockets or humps in the form along which the water passes.
13. The overhangs should be so prolonged that the water cannot strike a vertical surface forward or leave one aft.

Now consider all the yachts mentioned as heeled to the sailing angle and plot their waterlines. Evidently there is no relation between the dimension of hull taken on an even keel and taken heeled, except such as the designer chooses to make. Next look at the 22ft. class

the dimensions are correct, and of the owner that no changes of rig have been made without the designer's knowledge. Such a rule will produce the hull of least resistance, and cannot be beaten.

The features of measurement from the plans and when heeled were suggested by A.; the general form by C.

I have tried a number of the rules suggested, and I find it a simple matter to beat any of them, except the above, and I think the reason is that the others are based on assumptions of the resistance of ratios between certain parts or dimensions that do not exist in fact. Thus it is supposed that the area of midship section multiplied by length and a factor of from 0.53 to

4. The cockpit shall have its floor above the L.W.L. and shall have scuppers draining outboard.

5. The centerboard shall not come above the deck or cabin trunk.

6. The cabin shall contain cushions or mattresses for the berths or transoms, and one blanket for each berth or 7ft. length of transom, stove and cooking utensils, and receptacle for two gallons of fresh water.

7. There shall also be on board an anchor weighing not less than 1½lbs. for each foot of L.W.L. length, and not less than one fathom of suitable cable for each foot of L.W.L. length, life preserver, compass, riding light, fog horn, bucket and boat hook.

8. All inside ballast shall be stowed under the floor of cabin or cockpit.

9. All fixtures and fittings herein mentioned shall be suitable for cruising purposes, and shall not be removed or substituted by articles smaller or of lighter weight.

10. Existing cabin yachts (1897) may race in cabin classes, provided they carry the full cruising equipment.

The matter of racing dates was settled with very little difficulty, the fixtures for the season being as follows:

May 14, Saturday—Huguenot Y. C., special race.
May 21, Saturday—New Rochelle Y. C., spring regatta.
May 30, Monday, Decoration Day—Harlem Y. C., annual regatta.
Indian Harbor Y. C., special race.
June 4, Saturday—Knickerbocker Y. C., annual regatta for all classes.
June 11, Saturday—Corinthian Fleet of New Rochelle, annual regatta.
June 18, Saturday—Larchmont Y. C., spring regatta.

Racing Circuit.

June 25, Saturday—Seawanhaka Corinthian Y. C., annual race for all classes.
June 27, Monday—Stamford Y. C., annual regatta for all classes.
June 28, Tuesday—Indian Harbor Y. C., spring regatta.
June 29, Wednesday—Douglaston Y. C., annual regatta.
June 30, Thursday—Sea Cliff Y. C., spring regatta.
July 1, Friday—Reserved for either American Y. C. or Corinthian Fleet, special regatta.
July 2, Saturday—New Rochelle Y. C., annual regatta for all classes.
July 4, Monday—Larchmont Y. C., annual regatta.
July 5, Tuesday—American Y. C., annual regatta for all classes.

July 9, Saturday—Riverside Y. C., annual race.
July 11, Monday, to July 15, Friday—Seawanhaka Corinthian Y. C. trial races for 20ft. class of sloops.
July 16, Saturday, to July 23, Saturday—Larchmont Y. C., race week.
July 30, Saturday—Indian Harbor Y. C., annual regatta.
Aug. 6, Saturday—Hempstead Harbor Club, annual regatta.
Aug. 13, Saturday—Horseshoe Harbor Club, annual regatta.
Aug. 20, Saturday—Huguenot Y. C., annual regatta.
Aug. 27, Saturday—Indian Harbor Y. C., special regatta.
Aug. 27, Saturday—Huntington Harbor Y. C., annual regatta; Douglaston Y. C., special regatta.
Sept. 3, Saturday—Indian Harbor Y. C., fall race; Larchmont Y. C., special regatta.
Sept. 3, Saturday—Seawanhaka Corinthian Y. C., fall race for all classes.
Sept. 5, Monday, Labor Day—Norwalk Y. C., annual regatta.
Sept. 10, Saturday—Riverside Y. C., fall race.
Sept. 17, Saturday—American Y. C., fall regatta for all classes.

The statement was made that the Larchmont Y. C., the only club within the territory of the Y. R. A. which is not a member, had suggested that its racing dates be published in the official list of the Association. After some discussion it was decided that this be done. The following delegates were elected as Executive Committee for the year:

Oliver E. Cromwell, Seawanhaka Corinthian Y. C.; Charles T. Pierce, Riverside Y. C.; O. H. Chellborg, Knickerbocker Y. C.; E. Burton Hart, Jr., Huguenot Y. C.; W. P. Stephens, Corinthian Fleet, of New Rochelle; Charles P. Tower, New Rochelle Y. C.; and Frank Bowne Jones, Indian Harbor Y. C.

Y. R. A. of Massachusetts.

THE Y. R. A. of Massachusetts held its annual meeting at Young's Hotel, Boston, on March 17, with Pres. L. M. Clark in the chair, and the following clubs represented: American of Newburyport, Boston, Burgess, Cape Cod, Cohasset, Dorchester, Duxbury, East Gloucester, Hull, Jeffries, Kingston, Lynn, Manchester, Massachusetts, Mosquito Fleet, Plymouth, Quincy, Savin Hill, South Boston, Squam, Wellfleet, Winthrop and Wollaston.

The following officers were elected: Louis M. Clark, Massachusetts Y. C., President; A. H. Higginson, Manchester Y. C., Vice-President; A. T. Bliss, Winthrop Y. C., Secretary; Walter Burgess, Boston Y. C., Treasurer; Executive Committee: T. E. Jacobs, Hull Y. C.; Newton B. Stone, South Boston Y. C.; J. E. Robinson, Savin Hill Y. C.

A number of amendments were proposed, the most important providing for an associate membership of yacht owners, but nearly all were lost. The office of assistant secretary was abolished, and Rule II. was amended to make the entry fee \$1.

The following fixtures were arranged:
May 30, Monday, Memorial Day—South Boston, off City Point.
June 17, Friday—Massachusetts, off Nahant.
June 25, Saturday—Dorchester.
June 28, Tuesday—Mosquito Fleet.
July 2, Saturday—Jeffries.
July 4, Monday—City of Boston, off City Point.
July 7, 8 and 9, Thursday, Friday and Saturday—Winthrop.
July 9, Saturday—Quincy.
July 27, 28 and 29, Wednesday, Thursday and Friday—Manchester.
July 30, Saturday—Burgess.
Aug. 1, Monday—Manchester.
Aug. 2, Tuesday—Beverly, at Marblehead.
Aug. 3, 4 and 5, Wednesday, Thursday and Friday—Corinthian midsummer series.
Aug. 6, Saturday—Corinthian, open.
Aug. 8, Monday—American, Newburyport.
Aug. 9, Tuesday—Squam.
Aug. 10, Wednesday—East Gloucester.
Aug. 18, Thursday—Plymouth.
Aug. 19, Friday—Kingston.
Aug. 20, Saturday—Duxbury.
Aug. 22, Monday—Cape Cod at Provincetown.
Aug. 23, Tuesday—Wellfleet.
Aug. 27, Saturday—Wollaston.
Sept. 3, Saturday—Savin Hill.
Sept. 5, Monday, Labor Day—Lynn, off Nahant.

Cero.

W. E. C. EUSTIS, one of the Beverly Y. C.'s most enthusiastic racing men, is making a very interesting experiment with his 33-footer Cero, the fast centerboard developed by him from his original 30-footer Salmon, a boat by Dyer, of Lake Minnetonka. In Howland's shop, at Buzzard's Bay, Cicero is being given a new and much longer bow, so that her over-all length will be very close to 56ft. The new bow is similar to the one given by Mr. Eustis to his last year's 17-footer Capelin. It is a modification of the "scow" principle, as found in the Seawanhaka 20-footers, and yet an improvement, in that it gives more of a V than a U-shaped section to the bow for use in a seaway.

Cero's new bow runs forward close above the water, and finally turns sharply upward to the deck. The beam is carried quite well forward by the deck line, which is finally rounded in sharply to meet the stem. Were this all of the bow it would be little out from the Al-Anka type, but instead of floor and sides being rounded

into each other in continuation of the round bilge, they meet at an angle, giving much the same effect as on square-sided boats.

In practice on the Capelin this bow not only gained length and power for the boat when heeled, but also eased her in a seaway, because of the V-shaped section made by the angle of the sides and floor. How it will work in Cero remains to be seen, but the interest comes from the fact that she is the first large boat on which a bow of this kind has been tried.

In addition to the new bow, Cero is being given a cabin of good size under a house with curved sides and top, so as to offer very little windage. Her long centerboard has been taken out and replaced by a metal fin with a bulb of lead at a draft of 4ft. 6in. This fin is hollow, and in it slides a dagger centerboard to give the necessary grip to windward.

Should Mr. Eustis' experiment be successful, he will have a much faster as well as a handier boat for his cruises up the Sound, as well as around the Cape.—*Boston Globe*.

YACHTING NEWS NOTES.

Norota, keel sloop, has been sold by D. B. Burnham to Gordon Dexter, of Beverly, who will race her about Marblehead. The Cary Smith 35-footer Katona is being rigged anew for racing in the 35ft. l.w.l. class on Massachusetts Bay, and with Norota and the new Loring 35-footer now building at Wood's yard there will be some interesting racing this summer.

On March 19 the Seawanhaka C. Y. C. members were entertained by two stories of the blockade in the Civil War, one by Admiral Erben, U. S. N., Retired, who as a young man was in the blockading squadron about the Gulf of Mexico, and the other by Mr. Clarence Cary, who as a boy of sixteen was a midshipman in the Confederate Navy. Admiral Erben gave some statistics showing the magnitude of the system of blockade established by President Lincoln, the large profits resulting from its successful evasion, and details of life on a blockading ship. Mr. Cary, who spoke without notes, told a most interesting story of his personal experiences and observations on a Confederate war ship in running the blockade and in constant intercourse with the commercial blockade runners. Master Reuben Demarest, the boy pianist, played during the evening.

Fleur de Lys, schr., George Lord Day, sailed from New York for Southampton on March 17.

Thespia, steam yacht, has been sold by David Dows, Jr., to his brother, Tracy Dows.

Two of the new Seawanhaka knockabouts are now afloat at Marblehead and under trial. Mr. Stearns will make a very interesting experiment in sails, having two suits made exactly alike except that one will be cross-cut and the other with the cloths parallel to the leach. These two will be tried in turn on two boats, sails and crews being changed until it is determined which sail is the better.

The first of the Cohasset one-design boats has been completed.

Alga, cutter, the first Burgess 46-footer, has been sold by Albert Geiger, Jr., to Mr. Somerville, of New York, who will change her to schooner rig. The sale was made through Mr. Crowninshield, of Boston, and Mr. F. B. Jones, of New York, who have formed a partnership in the yacht brokerage business.

The Encinal Y. C. has elected the following board of directors: Dr. C. L. Tisdale, George T. Wright, H. K. Field, Phil S. Teller, H. M. Landsdale, Arthur M. Hickox and Martin Strauss. Dr. C. L. Tisdale was chosen President; P. S. Teller, Vice-President; and W. O. Henn, Secretary and Treasurer.

The Pistakee Y. C. elected the following officers: Com., Henry L. Hertz; Vice-Com., Alexander R. Beck; Rear-Com., Philip Jaeger, Jr.; Treas., Wm. M. Gunton; Sec'y, C. E. Blomgren; Fleet Chaplain, Noah H. Pike; Fleet Surgeon, Samuel M. Barnes. Regatta Committee: Alexander R. Beck, Philip Jaeger, Jr., Wm. M. Gunton, Henry L. Hertz, C. E. Blomgren, Charles J. Kuhn, John Oleson. Judges: Noah H. Pike, Adam M. Schillo and Fred L. Wilk. Measurers: A. C. Bower and Charles M. Palmer. The club adopted the Inland Lake Yacht Racing Association rules and regulations, including the Seawanhaka C. Y. C. measurement regulations. It will hold races once every week during July and August on Pistakee Lake and Bay. The fleet numbers three 20-footers and five 17-footers, including County Clerk Philip Knopf's fast yacht the celebrated Sleepy Tom.

A. C. A. Membership.

APPLICATIONS for membership may be made to the purser of the division in which the applicant resides on blanks furnished by purser, the applicant becoming a member provided no objection be made within fourteen days after his name has been officially published in the *FOREST AND STREAM*.

Eastern Division.

George E. Hutchins, Chelsea, Mass.
Foster H. Cary, Millbury, Mass.
Clarence W. Estabrook, West Newton, Mass.

PUBLISHERS' DEPARTMENT.

Asheville and Hot Springs, N. C.

THESE two charming resorts, located in the mountains of western North Carolina, are now being rapidly filled with winter tourists from the North. A more delightful place cannot be found to avoid the disagreeable March winds. They are easily reached from New York, via Pennsylvania and Southern Railway, by the Washington and Southwestern Limited, which leaves New York daily at 4:20 P. M., making the trip within twenty-two hours in through Pullman drawing-room sleeping cars. For full particulars, etc., call on or address Alex. S. Thweatt, Eastern Passenger Agent, 271 Broadway, N. Y.—*Adv.*

Washington.

PERSONALLY CONDUCTED TOUR VIA PENNSYLVANIA RAILROAD.

THE next three-day personally-conducted tour to Washington via Pennsylvania Railroad will leave New York and Philadelphia on Thursday, March 31. Opportunity will be afforded to visit, under the intelligent direction of an experienced tourist agent, all the principal points of interest, the Capitol, Executive Mansion, Congressional Library, the Monument, National Museum, etc. An experienced chaperon will also accompany the party as a companion for the unescorted lady tourists.

The rate, \$14.50 from New York, \$11.50 from Philadelphia, and proportionate rates from other points, includes all necessary expenses during the entire trip—transportation, hotel accommodations, and guides.

Persons desiring to return via Gettysburg may do so by purchasing tickets at \$2 extra, which include this privilege. An opportunity will also be afforded to visit Mt. Vernon and Arlington at a slight additional expense.

For itineraries, tickets and full information apply to ticket agents; Tourist Agent, 1196 Broadway, New York; or address Geo. W. Boyd, Assistant General Passenger Agent, Broad Street Station, Philadelphia.—*Adv.*

In the Chicago Trade.

SOME sportsmen take a trunk when they go traveling, or when they go to a trap tournament, and some do not. Those who do, wish they had a trunk which would hold a gun in its place and keep the shells from mixing up with the eau de cologne. Those who do not take a trunk wish they had a good one to take. A genuine sportsman's trunk, one with places for old clothes, good clothes, gun, shells and everything that a shooter or angler needs to take along, is something which the magnificent resources of the American sporting goods trade has never yet until now offered, so far as I know. The Hogan Gun Trunk Co., of Chicago, are now offering such a trunk, and it should meet a want.

Mr. Jas. H. Fisk, an old-time figure in the Chicago sporting goods trade, is now located at 125 Dearborn street, this city, and will offer his old friends his former close attention.

F. S. Boyden & Co., Clark and Madison streets, Chicago, will this spring bring out new designs in club badges and medals. It's a poor shooter who can't wear a medal, and a good one.

E. HUGH.

Rifle Range and Gallery.

Scores at Boston.

Boston, March 21.—The rifle and revolver practice in the basement of the big building is receiving a good deal of attention. In the championship rifle match there are a good many entries, embracing some of the best shots in the country.

For the re-entry rifle match, standard target, the entries include D. Johnson, J. T. Humphrey, H. M. Pope, E. S. Pillard, M. Dorrier, E. H. Eastman, O. M. Jewell and J. E. Kelley.

For the revolver match, any revolver, the entries include E. E. Partridge, A. A. Webber and J. H. Wesson, with other entries, of course, these being the leading shots.

The pistol match entries include Sumner Paine, John Paine, E. E. Partridge, A. A. Webber, J. H. Wesson and J. T. Humphrey, with a good many shots of lesser fame. The above matches are each to be shot off before the Exhibition closes.

The principal scores thus far in the matches at the Sportsmen's Exposition, up to 9:30 o'clock to-night are as follows:

Match A—Any revolver championship: A. A. Webber 423.
Match E—Any revolver, re-entry:
J. H. Wesson.....57 57 57 53 53—277
E. E. Partridge.....55 55 54 54 57—275
John Caswell.....44 36 36 36 33—185
O. B. Joyeux.....54 52 47 44 43—241
Capt O'Brien.....42 37 — — — —
H. C. Clifford.....41 39 30 40 —151
J. K. Barnes.....48 47 45 48 42—230
Dr. A. A. Webber.....57 57 57 57 57—285
W. A. Mann.....58 56 56 56 55—281

Match D—Rifle championship:
H. M. Pope.....117 117 118 121 119 113 121 116 115 —1178
E. S. Pillard.....120 117 122 118 115 117 117 116 118 117—1177
A. H. Merrill.....98 83 — — — —
M. Dorrier.....118 116 115 119 108 117 119 114 124 —1170

Match Y—Military revolver, re-entry:
E. E. Partridge.....29 28 28 27 27—139
O. B. Joyeux.....29 29 28 28 27—141
R. Robertson.....28 27 25 24 25—129

A Revolver Match by Telegraph.

LOUISVILLE, Ky., March 12.—Dr. A. A. Webber, of the Brooklyn Revolver Club, in a letter to Mr. E. B. Dye, of the Louisville Revolver Club, proposes a series of team matches by telegraph, something unique, to say the least. The plan proposed is to have a representative of a local newspaper at each club's grounds, the scores to be thus certified and sent in to the opposing team by wire. It is proposed to have the match to consist of 10 shots to each man, in teams of three, five, eight or ten men, 50, 30, 20, 15 and 10yds. distance, standard American target, to cut the line to count. The idea proposed is to shoot only at one distance each evening, thereby giving time for both clubs to practice, and no doubt some of the existing records will be lowered. Only full charges of powder will be allowed, and .38 and .44cal. revolvers to be used.

Louisville Club has some good crack revolver shots, who are anxiously looking forward to the proposed match.

Trap-Shooting.

Leading dealers in sportsmen's supplies have advertised in our columns continuously for almost a quarter century.

If you want your shoot to be announced here send in notice like the following:

Fixtures.

March 29-April 1.—Reading, Pa.—Annual tournament of the Pennsylvania State Sportsmen's Association, under the auspices of the Independent Gun Club, of Reading. A. Knauer, Sec'y.

April 5-8.—Baltimore, Md.—Baltimore Shooting Association's spring tournament. Two days targets, \$100 added each day. Two days live birds, \$500 guaranteed in Maryland Handicap. All surplus added. Geo. L. Harrison, Sec'y-Treas.

April 7-8.—Platte City, Mo.—Annual spring tournament of the Platte City Gun Club. S. Redman, Sec'y.

April 8.—Bridgeport, Conn.—Target tournament of the Bridgeport Gun Club. J. G. Kingsbury, Sec'y.

April 13-15.—Aichison, Kans.—Manufacturers' fourth annual amateur tournament; \$500 cash added; \$50 high average. Jack Parker, Manager; Lou Erhardt, Sec'y.

April 13-15.—Macon, Ga.—Tournament of the Interstate Association, under the auspices of the Macon Gun Club. F. C. Etheridge, Sec'y.

April 14-15.—Newburgh, N. Y.—Special shoot, Hudson River Trap-Shooters' League, on grounds of Glenwood Gun Club. J. B. Rogers, Manager.

April 15.—Worcester, Mass.—Tournament of Massachusetts State Shooting Association, under the auspices of the Worcester Sportsmen's Club. A. W. Walls, Sec'y.

April 18-20.—St. Louis, Mo.—Tournament for amateurs only at the Du Pont shooting Park, under the management of J. A. Corry.

April 19-21.—Lincoln, Neb.—First annual amateur tournament of the Lincoln Gun Club. Each day \$50 added to the purses. Geo. L. Carter, Sec'y.

April 27-28.—Peru, Ind.—Second annual amateur tournament. Jack Parker, Manager. Address all communications to J. L. Head, Peru, Ind.

May 4-5.—Brunswick, Ga.—Tournament of the Interstate Association, under the auspices of the Atlantic Gun Club. J. H. Polhill, Sec'y.

May 4-6.—Newburgh, N. Y.—Trophy shoot, Hudson River Trap-Shooters' League, on grounds of Newburgh Gun and Rifle Club. J. B. Rogers, Manager.

May 10-11.—St. Cloud, Minn.—St. Cloud Gun Club's amateur tournament. E. S. Hill, Sec'y.

May 10-13.—Des Moines, Ia.—Charley Budd's shoot. First three days, targets; \$350 added. Fourth day, live birds; 25 birds, \$25, handicap, \$50 added.

May 16-21.—Kansas City, Mo.—Annual tournament Missouri State Fish and Game Protective Association. G. M. Walden, Pres., Kansas City.

May 17-20.—Newark, N. J.—Tournament of the New Jersey State Sportsmen's Association, on the grounds of the East Side Gun Club. T. H. Keller, Sec'y.

May 18-19.—Crawfordsville, Ind.—Tournament of the Crawfordsville Gun Club. C. E. Lacy, Sec'y.

May 18-20.—Waterloo, Ia.—Annual tournament of the Waterloo Gun Club.

May 24-27.—Omaha, Neb.—Twenty-second annual tournament of the Nebraska State Sportsmen's Association. F. S. Parmelee, Sec'y.

May 25-26.—Wilmington, N. C.—Tournament of the Interstate Association, under the auspices of the Eastern Dog and Game Protective Association. H. McL. Green, Pres.

May 30.—Canajoharie, N. Y.—Decoration Day shoot of the Canajoharie Gun Club. Targets. Charles Weeks, Sec'y.

June 1-2.—Peekskill, N. Y.—Trophy shoot, Hudson River Trap-Shooters' League, on the grounds of Peekskill Gun Club. J. B. Rogers, Manager.

June 2-3.—Alton, Ill.—Second annual bluerock tournament of Piasa Gun Club. F. C. Riehl, Sec'y.

June 7-8.—Ottawa, Kans.—Annual tournament of the Kansas State Sportsmen's Association. W. L. Beardsley, Sec'y-Treas.

June 7-8.—Indianapolis, Ind.—Annual tournament of the Indiana Trap-Shooters' League, of Indiana, on the grounds of the Limited Gun Club.

June 8-9.—Findlay, O.—Annual tournament of the Magautrap Gun Club. O. B. Marvin, Sec'y.

June 8-10.—Parkersburg, W. Va.—Second annual tournament of the West Virginia State Sportsmen's Association. Address all communications to Ed O. Bower, Sec'y, Sistersville, W. Va.

June 14-15.—Stillwater, Minn.—Tournament of the Stillwater Gun Club.

June 15-16.—Portsmouth, Va.—Tournament of the Interstate Association, under the auspices of the Portsmouth Gun Club. W. N. White, Sec'y.

June 15-17.—Cleveland, O.—Fifth annual tournament of the Cleveland Target Co. Bluerocks thrown free of charge. Professionals and manufacturers' agents barred from programme events.

June 20-24.—Rochester, N. Y.—Annual tournament of the New York State Association, under the auspices of the Rochester Rod and Gun Club. Live birds and targets.

June 21-23.—Sioux City, Ia.—Fourth annual amateur tournament of the Soo Gun Club. Three sets of traps. W. F. Duncan, Treas.

June 23.—Minneapolis, Minn.—Tournament of the Minneapolis Gun Club. G. J. McGraw, Sec'y.

July 1.—Sherbrooke, Canada.—Grand annual tournament. Targets. Regular sweeps, variety and merchandise. C. H. Foss, Sec'y.

July 6-7.—Meadville, Pa.—Tournament of the Interstate Association, under the auspices of the Meadville Gun Club. Chas. Stein, Sec'y.

July 19-21.—Palmyra, Mo.—Eight annual tournament of the Missouri Amateur Shooting Association, under the management of the Palmyra Gun Club. Targets and live birds. Added money announced later. W. N. Bates, Sec'y.

July 27-28.—Meriden, Conn.—Tournament of the Interstate Association, under the auspices of the Parker Gun Club. C. S. Howard, Sec'y.

Aug. 10-11.—Marlborough, N. Y.—Trophy shoot, Hudson River Trap-Shooters' League, on grounds of Marlborough Gun Club. J. B. Rogers, Manager.

Aug. 17-18.—Waterville, Me.—Tournament of the Interstate Association, under the auspices of the Waterville Gun Club. E. T. Wyman, Sec'y.

Sept. 7-8.—Haverhill, Mass.—Tournament of the Interstate Association, under the auspices of the Haverhill Gun Club. Geo. F. Stevens, Sec'y.

DRIVERS AND TWISTERS.

Club secretaries are invited to send their scores for publication in these columns, also any news notes they may care to have printed. Ties in all events are considered as divided unless otherwise reported. Mail all such matter to Forest and Stream Publishing Company, 345 Broadway, New York.

The programme of the fifth annual tournament of the Baltimore Shooting Association, April 5 to 8, two days targets, \$200 added; two at live birds, \$500 guaranteed in Maryland Handicap, and all surplus added, is now ready, and can be obtained of the secretary, Mr. George L. Harrison. The tournament will be held on the grounds of the Association, Pimlico Road, opposite Halstead's Hotel, about twenty-five minutes' ride from the center of the city. Take either Druid Hill avenue, Carey or Gilmore line of cars, and transfer to Pikesville, or West Arlington line at Fulton avenue. All target events will be at known traps, except Nos. 5 and 10, which will be expert rule, one man up, and purses will be divided into four moneys—40, 30, 20 and 10 per cent. The tournament will be managed by James R. Malone, assisted by H. P. Collins. Shells shipped in care of Alford Sporting Goods Co., No. 120 East Baltimore street, will be delivered on the grounds. Dropping for place will not be tolerated, and any one detected in such practice will be debarred. The first and second days have each ten target events, each 20 targets, \$2. Of the last two days, April 7 has three events, the Baltimore Introductory, 7 birds, \$5, 30yds., high guns; Suburban sweepstakes, 10 birds, 30yds., \$10; Pimlico Handicap, \$10, birds extra, handicap 25 to 33yds. All these are 50, 30 and 20 per cent, high guns. The fourth day will be devoted to the Maryland Handicap, 25 birds, \$25, 25 to 33yds., 50, 30 and 20, class shooting, \$500 guaranteed, all surplus added.

Under date of March 14 Mr. Louis Erhardt, in the matter of the amateur tournament at Atchison, Kans., writes us as follows: "We expect to have the largest amateur shoot that has ever been held in the West. The \$500 added money will be all cash, and will be paid rain or shine. If we cannot shoot we will shake dice for it. We are very sorry this year to be compelled to bar the manufacturers' agents and professionals from taking part in events that have added money, but we will have a set of traps open for them and all others that may want to contest. We feel safe in saying that we will have events that will run over 100 entries. Our past record, which has done this, is assurance enough. We will issue a small programme, which we will be pleased to send to any one requesting same."

Under date of March 18 Mr. H. P. Collins, treasurer of the Baltimore Shooting Association, writes us as follows: "Since there appears to be such a deep-seated feeling and opposition to the Winslow system, we have decided to do away with it at our forthcoming tournament, and adopt the old system—40, 30, 20 and 10 per cent. This will please the minority, but not the majority. Kindly announce in next issue that the old system will be used." We can only offer the comment that in our opinion it is a grave error to cater to the minority, and displease the majority.

In the Cuckoo Club's shoot this week one of the contestants was shooting with that becoming seriousness coincident with shooting a 20-cent sweep. At length he had a miss-fire, and as he threw the shell away, more in sorrow than in anger, he said: "That is the first miss-fire I ever had with those shells." A curious member picked up the shell forthwith and called the attention of the assembled hosts to the fact that it was a dummy shell with a glass section in its side, a glass wall over shot, such in short as is used by the trades to illustrate at a glance the load used. All hilariously concurred that the miss-fire was an excusable one.

In the latter part of last week and Monday of this week sportsmen's row was alive with the men who make the history of the shotgun in the realm of high scores. The first prize in the Grand American Handicap was where their thoughts mostly centered.

The programme of the eighth annual tournament of the Pennsylvania State Sportsmen's Association contains a brief history of Reading, the constitution and by-laws of the Association, the rules which will govern the shooting of targets, the trap-shooting rules of the Association governing live-bird shooting, the new game laws of the State of Pennsylvania, and the most minute information as to the events and the conditions pertaining to them. Edward Yeager, corresponding secretary, Reading, Pa., will supply applicants with copies.

It is intimated that if Uncle Sam holds his contemplated international tournament, it will seriously conflict with the interests of the tournament of the Interstate Association, fixed for April 13-15, under the auspices of the Macon Gun Club, since that section will be the great highway of Uncle Sam's scratch men. However, as he has claimed no dates for the event, nor posted a forfeit, it is hardly worth serious consideration at the present juncture.

The mighty gathering of the knights of the gun at Elkwood Park this week attests the sterling worth of the sport and its broad popularity. It further attests the solid foundation which supports it. Its steady growth year by year, in support and prestige, augurs well for the future of trap-shooting in America. A glance at the numerous fixtures in these columns is additional evidence to this point, and also will show what a variety of entertainment is offered to trap-shooters in the coming weeks.

Mr. Elmer E. Shaner, of Pittsburg, refereed most of the shooting at the meeting of the Boiling Springs Gun Club, March 16. The blithesome tenor tones in which "Dead" was uttered seemed to denote a personal rejoicing on his part when success crowned the shooter's effort, as did the dolorous bass tone, in which "Lost" was announced, also seem to indicate a feeling of anguish at any failure.

Mr. Edward Yeager, Reading, Pa., under date of March 19, writes us that in addition to the programme of the events of the Pennsylvania State shoot, there will be a silver trophy donated by the Troisdorf Powder Company, of New York, through their new agent, Gus Greiff, to be given to the winner of the Williamsport championship event, and to become the personal property of party making highest score.

Mr. Gus E. Greiff informs us that he has accepted the position of manager of the Troisdorf Powder Co., 320 Broadway, where he will be glad to meet his old friends, and also to make new ones. Mr. F. W. Groos, the agent for the Troisdorf powder, informs us that they will have a special load to offer trap-shooters soon, made with a view to supplying their special needs.

The match of W. and W. Weideman against F. Gross and Chas. Ritter, fixed for March 14, at Norristown, Pa., at 25 pigeons, \$25 a side, was declared off on account of a disagreement as to the color of the birds, one side wishing to shoot at all white birds, which served quite as good by way of objection as would an objection against the shape of the birds.

Mr. Hood Waters, well known to trap-shooters of the East, has been a successful participant in events of the shotgun in Washington since his arrival there some time ago. As hinted by Mr. Banks in this column some weeks ago, Mr. Waters told a good shooting eye and trigger finger in the East, and it is quite likely that he took them with him when he went thitherward.

The Nebraska State Sportsmen's Association will have two sets of traps at its twenty-second annual tournament, May 24 to 27, at Omaha. The Sergeant system will be used in throwing targets. The tournament is open to all. There will be ten general averages. There will be ten events, 20 targets each per day. To the purses will be added \$1,000 in cash.

Keep in mind that the Boiling Springs Gun Club has set the first and third Wednesdays of March and April for the gold watch handicap, 50 targets, and the second and fourth Wednesdays of each month for the E. C. cup handicap, 15 singles, 5 pairs. In each event the entrance is the price of the targets.

The U. S. Smokeless Powder Co. has now ready a new issue of their booklet, which tells all about the best manner of loading Gold Dust smokeless, and also sets forth its good qualities. W. L. Colville, Eastern manager, Batavia, N. Y., will be pleased to send copies to those who send requests for them.

Capt. A. W. Money's skill with the shotgun is too well known to dwell upon as a matter of debate, but as a particular instance of excellence it may be mentioned that his performance at the Brooklyn Gun Club's shoot on last Saturday, wherein he broke 97 out of 106 shot at, nearly a 92 per cent. gait, is not to be classed with the easy performances.

In the Central New York Handicap the principal event of the Oneida County Sportsmen's Association tournament, Mr. J. J. Hallowell of the U. M. C. Co., made a very creditable score of 24, winning first money.

Mr. A. C. Paterson, in Western traps, mentions the challenge of Mr. J. A. R. Elliott to Mr. Fred Gilbert, to contest for the Kansas City Star Cup, and the probability of a settlement of the match in the near future.

The report of the Oneida County Association's tournament was received two late for publication this week. We regret that other matter will also necessarily be left over to our next issue for the same reason.

The dates of the amateur shooting tournament, to be held at Dupont Shooting Park, St. Louis, have been changed from April 7-9 to April 18-20.

The Galena, Kans., interstate shoot set for March 28 has been postponed to a time of more favorable weather. The secretary is W. W. McIlhenny, of Galena.

The Minneapolis Gun Club will hold a tournament on June 2 and 3.

BERNARD WATERS.

WESTERN TRAPS.

OFF FOR THE GRAND AMERICAN.

CHICAGO, March 19.—A merry party of Western shooters swarmed into the long train of the Grand Trunk Railroad this afternoon at 3 o'clock—forty-six of them in all, and every one with a record and a smile. There will be fun on board that train, sure as shooting. The names of the aggregation have been given earlier in FOREST AND STREAM. What they will do with the cracks of the East remains to be seen, but the feeling out here is one of entire confidence in the representatives of the realm west of the Alleghenies. We expect first, second and third high guns at least and the Grand American for 1898. The gentlemen of New York will have met the delegation by the time this is in print, and will be able to judge for themselves if they are not a pretty good lot of men, any way you look at them.

A number of this Grand American Handicap party have been here in Chicago practicing at Watson's this week, and the traps at the old grounds have been pretty busy. Gilbert, Grimm and Budd have been shooting at the 32yds. score in order to get a bit of practice for their probable mark at the handicap. Tom Marshall hardly expects to get put at 26yds. himself, so he has been going back into the shed and shooting at long range. Charlie Budd, Charlie Grimm, Mr. and Mrs. Shattuck, J. J. Giletz, of Tampico, Ill.; Dr. W. B. Kibbey, of Marshalltown, Ia.; E. A. Leach, of Tripp, S. D., and others of the visitors have been regulars at Watson's this week. The rest of the contingent from States west of here mostly arrived this morning. There were nine States represented at Watson's yesterday.

MERRILL PROTESTS.

Mr. Richard Merrill, of Milwaukee, has protested against the scores of the final shoot of the National Gun Club, of Milwaukee, for the Chapman trophy. He states to the board of directors that he was ignorant of the rule limiting the number of postponed shoots to one, and says that he heard no objection until it was learned that on Monday's shoot he had tied the scores of Dr. Williamson and T. A. Thomas. In the shoot mentioned the following scores were made: Klapinski 8, Rogers and Williamson 9, Thomas 10, Hobbs 6, Richter 5, Collins 10, Voss 9, Plankinton 7. Merrill shot up his back scores—he has been out of the city—making 5 scores of 10 birds each, of which he scored 46, or 55 total for six season events. It was this shooting up of back scores to which others objected, and over which he protests.

BIG CLUB FOR CINCINNATI.

Cincinnati has come to the front with a large and up-to-date trap-shooting organization, the Cincinnati Gun Club, which held a preliminary meeting with great enthusiasm last Saturday. The most modern trap appliances will be put in use and the very best obtainable ground will be arranged for occupancy at an early date. The men who have signed the roster are at the head of the craft in that section.

CENTRAL KANSAS.

The strong association known as the Central Kansas Sports-

men's Association is shaking things up west of the Missouri. A rattling tournament will be held at Hutchinson, March 24, and a dozen strong shooting towns will have representation. The event should prove a good one.

NEBRASKA STATE.

The twenty-second annual tournament of the Nebraska State Sportsmen's Association will be held at Omaha May 24-27, and this also will be a stiff event. One hardly thinks of Nebraska as very old, but her central shooting organization has passed its majority, it seems. The shoot of this Association will be marked by a trial at the adjustment of the wolf and lamb question. Professionals and experts will be asked to pay 50 cents extra entrance, this extra money to go into a fund for the use of all the amateurs who shoot through the entire programme and who fail to get into any of the regular average money. In these days there are worlds of "systems" and schemes to even up matters between the professional and the expert, and all sorts of projects are devised to jolly up that highly desirable gentleman the lamb.

JUNCTION CITY DATES.

Learning that their dates claimed, April 19-21, conflicted with those of the Lincoln, Neb., tournament, the management of the Junction City, Kans., tournament have changed dates, and now claim April 26-28.

COMING.

Mankato, Minn., has organized a gun club with sixteen members, and will go to work this season. Green Bay Gun Club, of Wisconsin, has appointed a committee to get up a programme for a tournament next summer.

The new gun club of the Chicago Athletic Association was formally organized March 16, with thirty members, and will soon be in the field for honors at the traps. The committee on rules and regulations are Col. C. E. Felton, Mr. E. R. Pike, Mr. W. L. Shepard.

Lists of eligibles for the first contest for the Chicago live-bird challenge trophy are now in possession of the trustees. There will be a big turnout the first Wednesday.

COLLEGE CORNER.

This week's contest of the College Corner, O., Gun Club is covered thus by the secretary, Mr. Reid: "Club shoot at 50 blue-locks, for the club medal: Wright 25, Smoyer 23, Bergau 37, Caldwell 40. This makes the third time Caldwell has won the medal. He has only been shooting since Jan. 1. We think 40 out of 50 is a good score for a green shooter." E. Houghton.

1206 BOYCE BUILDING, Chicago, Ill.

STONY ISLAND GUN CLUB.

March 19.—The target medal contest shot to-day resulted as follows:

Edith Porter	0101011101000010110011111	10	21
S. G. Zimmerman	11111101001001111111111	3	23
W. J. Schall	0010110110101000010011110	6	18
Capt. Fyfe	0011100001001001000110001	4	13
L. Larimore	00111011111111000101101	3	20
Capt. Porter	001000011110100001010110	4	15
Dr. Larkin	111001111110011100110011	2	19
Chas. Porter	001000010010110101010101	5	14

Conditions, 25 targets, Illinois State rules. E. Porter holds the medal. The handicaps are added to the scores.

E. PORTER, Sec'y.

CHICAGO, March 18.—The congregation of Western shooters assembled in Chicago preparatory to their departure for Elkwood Park, N. J., to attend the Grand American Handicap contest. Among those who arrived to-day from Iowa were Charles Grimm, of Clear Lake; Fred Gilbert, of Spirit Lake; Charles Budd, of Des Moines; E. A. Leach, of Tripp, South Dakota; Lee Huckins, of Neogaunee, Ill.; W. B. and H. Dunnell, of the Fox Lake region, Ill.; Thomas Laffin, of Rock Island; and the Hon. Thomas Marshall, of Keithsburg, Ill.; Mr. and Mrs. W. P. Shattuck, of St. Paul, Minn.; George Deiter, of Milwaukee, Wis.; John J. Sumpter, Jr., of Arkansas; Dr. Kibbey and W. Fred Quimby, of New York. These, together with a number of Chicago shooters who will also attend the event, put in the day at Watson's Park at Burnside Crossing, Ill.

A race between Charles Budd and W. P. Shattuck, against Fred Gilbert and Mrs. W. P. Shattuck, at 15 live birds each, for the price of the birds and the suppers, was shot, Messrs. Budd and Shattuck winning the same by 3 birds.

The day was very misty, and no sun shone at any time during the afternoon. The wind was from the left quarter, and was mild. The birds were as good a lot as ever were trapped, and flew in all directions. Many good kills were made.

Following are detailed scores of the contest:

Charles Budd	021211212222222	14
W. P. Shattuck	212222102222220	13
Fred Gilbert	222222222222022	13
Mrs. W. P. Shattuck	1012202122220101	11

Following are scores in 25-bird shoot:

CHICAGO, March 19.—J. A. R. Elliott, of Kansas City, Mo., has challenged Fred Gilbert, of Spirit Lake, Ia., for the Kansas City Star cup, under date of the 17th inst. Mr. Gilbert will accept the challenge and name the date and place of contest some time early after his return from the Grand American Handicap shoot held at Elkwood Park.

A. C. PATERSON.

AUDUBON GUN CLUB.

March 16.—Scores were made as follows:

GRAND AMERICAN HANDICAP.

All Records are Broken.

With a list of over 200 entries, the sixth annual Grand American Handicap of the Interstate Association, Wednesday and Thursday of this week, breaks all previous records in an event of this kind, and establishes a high-water mark that it will be a hard matter to wash out.

Starting in a very modest way in 1893, the first annual Grand American Handicap boasted of but twenty-one entries; this event was shot off at Dexter Park, R. A. Welch, of Philadelphia, being the winner. In 1894 Dexter Park was again chosen as the scene for the decision of the event, and on this occasion there were fifty-four entries, T. W. Morley, of Paterson, N. J., winning first place. In 1895 the number of entries was sixty-one, J. G. Messner, of Pittsburg, Pa., being the winner. This event was shot off at Willard Park, near Paterson, N. J. The fourth annual Grand American Handicap was held at Elkwood Park, N. J., under very adverse conditions as to weather, a heavy snowstorm falling on the day previous to the opening of the tournament. The number of entries on this occasion showed a large increase over that of 1895, 109 being the total of those who paid their entrance fees, 105 actually competing in the event. O. R. Dickey won the cup given on this occasion by Messrs. Daly, Sr. and Jr. Last year the new grounds at Elkwood Park were an undoubted attraction, so that it was no matter for surprise when the entry list reached the then new record of 146, a number that was highly gratifying to the Interstate Association. Hon. Thos. A. Marshall, of Keithsburg, Ill., was the winner of first place.

The Interstate Association Indorsed.

Turning to the list of entries for this year's Grand American Handicap, nowhere could there be found a stronger indorsement of the Interstate Association's action in again selecting Elkwood Park as the scene for the Grand American Handicap. Elkwood Park's shooting grounds cannot be surpassed, and the ease and smoothness with which the 146 entries were handled last year, despite the unpleasantness of the weather part of the time, left the Association little ground for selecting any other location for 1898. This year too, learning from the experience of last year, Messrs. Daly & Chanfrau, the managers of Elkwood Park, have made several important changes that will be felt by those who take part in or by those who are simply spectators of the greatest shooting event the world has ever known.

On examination the entries disclose the fact that twenty-seven States are represented in this year's contest, while Canada sends two shooters and the District of Columbia one. New York leads with 44, New Jersey being second with 38. Then comes Pennsylvania with 28, Illinois being a good fourth with 22. Massachusetts, a State in which no live bird shooting is permitted by law, sends 10 entries, Ohio being sixth with 9. Iowa and Connecticut have 5 each; Tennessee and Minnesota 4; Indiana, Wisconsin, Rhode Island and Nebraska send 3 each; Vermont, Maine, Kentucky and Texas 2 each; North and South Carolina, Missouri, California, South Dakota, Michigan, Washington, Indiana and Arkansas are each represented by 1 entry.

A resumé shows that 132 are from the East, 51 from the West, 16 from the South and 2 from Canada. Below will be found a list of the entries, showing order of shooting and the handicaps awarded. (It is as well to note that the tournament committee of the Interstate Association sent a letter to the handicapping committee, Messrs. Jacob Pentz, Will K. Park and Elmer E. Shaner, suggesting that it be lenient with all entries other than those who are known to be experts of the highest class.)

The Entries, Order of Shooting and Handicaps.

Elkwood Park.

MARCH 22.—The preliminary events of the Grand American Handicap, namely the Elkwood Park Introductory, the Nitro Powder Handicap and the Branchport Sweepstakes, were unfortunate in respect to weather, a cold, slow rain falling most all day long, and a heavily overcast sky made a poor light.

Sistersville Rod and Gun Club.

SISTERSVILLE, W. Va., March 15.—The following scores were made on the grounds of the Sistersville Rod and Gun Club to-day and on the 12th inst.:

On March 15 each of the three events was at 7 birds, \$3 entrance, birds extra.

Hudson River Trap-Shooters' League.

WARWICK, N. Y., March 19.—The Hudson River Trap-Shooters' League claim the following dates: April 14-15, Newburgh, special shoot, Hudson River Trap-Shooters' League, on the grounds of the Glenwood Gun Club. May 4-7, Newburgh, trophy shoot, Hudson River Trap-Shooters' League, on the grounds of the West Newburgh Gun and Rifle Association. June 1-2, Peekskill, trophy shoot, Hudson River Trap-Shooters' League, on the grounds of the Peekskill Gun Club. Aug. 10-11, Marlborough, trophy shoot, Hudson River Trap-Shooters' League, on the grounds of the Marlborough Gun Club. All are managed by me. Other dates will be granted later. JOHN B. ROGERS, Manager.

Trap Shooting and Klondicittis.

SEATTLE, March 7.—Big Dan Wallace and Old Scout Gorham from Sistersville, W. Va., left here on the steamer City of Seattle for the Klondike last night. They have been with me since Feb. 22. I was walking down the street to my office on that day past the post-office, when some one in the crowd said, "Pull!" and another said, "Dead bird." Naturally I looked around, when to my surprise there they were, as live a pair as ever you saw. I took them to the shoot that afternoon, and both did fairly well, but were suffering a little too much with Klondicittis; but from this they soon recovered, and before they left were grinding the targets into powder, and showing the boys out here how they could pound them out. Old Scout, at Tacoma, on the 27th ult., got about 96 out of 100, and Big Dan was not far behind with 95 to his credit. Old Scout received a letter from his esteemed friend Dade, of Sistersville, telling him of that great 99 out of 100 that he had broken. Old Scout thought it looked very nice on paper, but he don't know how about it exactly, and came very near taking advantage of the reduced rates at present to return to his native heath, and show Dade that he is not the only shooter that can shoot the shoots. Wallace says Big Laugh can laugh muchee now, as both Dan and Old Scout are on their way north, and have no opportunity to get back at him. But there will be a day of reckoning when they return with those nuggets. Look out for your 99s then, Dade.

But if Big Laugh desires to take advantage of the low rates and come to Seattle he might find some old broken down Eastern sports out here who could break 99 in days gone by, and can perhaps accommodate him yet.

In Seattle and Tacoma are some pretty good shots, and at present there is a great rivalry between the two cities to carry off the State cup. Tacoma at present holds the cup, but the Seattle boys are hot after them. There will be a shoot for this cup on March 20, five men in each team, 50 birds to the man.

The last race resulted 208 for Tacoma to 200 for Seattle, but the latter hopes to beat Tacoma's score of 208 next time. The Seattle boys are now shooting under the Sergeant system. Inclosed you will find scores of last week at their new grounds:

The International Tournament.

The International tournament, held in St. Thomas, Ont., on March 8, 9 and 10, under the auspices of the St. Thomas Gun Club, and the active and capable management of Mr. John Parker, the celebrated shot of Detroit, and his gifted secretary, Mr. Walter W. Bock, was unique in many respects.

It was new to St. Thomas and to Canada. It had for the winner the only live-bird international trophy in existence. All the entrance money and some \$400 of added money were divided among the winners, and there was the reasonable bar placed against professional shooters, which made the meeting specially attractive to amateurs, while agents had every opportunity to display their skill and their goods, and to win money by average, as they were admitted to all events for birds only, and to the trophy competition.

The novel features of the meeting had the effect, as expected, of inducing a large number of both professional and amateur shots from Canada and the United States to participate.

Among those who took part may be mentioned John M. Lilly, Indianapolis, Ind.; C. A. Young, Springfield, O.; G. Beck, Indianapolis; Thos. J. Graham, Sault Ste. Marie; T. P. Easton, Monroeville, O.; E. Tripp, Indianapolis; J. De Wolf, Chicago; J. Parker, Detroit; P. C. Wood, J. A. Mercer, Harry Morse, George McKay, Marks the Lawyer, J. E. Gauthier and others, from Detroit; John Fanning, Batavia, N. Y.; Josh Wayper, Hespeler, Ont.; John Thompson, Jackson, Mich.; Harry Wingate, Dr. J. E. Overholt, H. Graham, Sec'y Hamilton Gun Club, Hamilton, Ont.; Alf Pope, Corry, Pa.; J. J. Hallowell, Bridgeport, Conn.; C. W. Lane, Hilton, N. Y.; C. S. Burkhardt, Benker Tolsma and others, from Buffalo, N. Y., and a cloud of Canadian shots from Windsor, Woodstock, Hamilton, Toronto, and many minor places.

Our Lady of the Snows was propitious, and the meet enjoyed three as fine warm days as it would have expected in the Gulf States.

The St. Thomas Gun Club devoted itself first to the comfort of its guests, and on this account does not figure in the scores according to its merit. Thos. Donley, president of the club; B. Emslie, one of our best shots, better known as the great national base ball umpire; Chas. Kennedy, Chas. Dyer, Joseph Coffey, James Haight, Ernie Baugher, and nearly all the rest of St. Thomas' best shots were satisfied for the time to fill the subordinate positions which are necessary to the smooth running of a great meet, and they shot merely as a matter of form, but still with some considerable success.

In average over all events Josh Wayper, proprietor Queen's Hotel, Hespeler, Ont., stood first, and he with Tripp, Easton, Lane and Graham divided \$60 average money, being 1 cent for each bird flown in the tournament.

The ammunition agents succeeded in showing off their wares in great style.

Too much praise cannot be given Mr. John Parker, of Detroit, to whose efficient management, and the untiring support given by the local club, much of the success is due.

The management was so well satisfied with the patronage and the results that they have determined to make it an annual event, with such new and improved attractions as experience may warrant.

The visitors were so delighted with the treatment they received that they presented Mr. Donley with a highly appreciative testimonial commemorative of the event, and setting forth that among other things they had found the "accommodations perfect," sport good, management all that could be desired, weather fine, classes large and money paid at the conclusion of each event, and giving Mr. Promoter Donley, Mr. Manager Parker, his secretary, Mr. W. Bock, of Detroit, the local club and the city unqualified praise.

TUESDAY.

No. 1 was at 10 targets, \$1; No. 2, 10 targets, \$1.50; No. 3, 20 targets, \$2; No. 4, was at 25 targets, \$3; No. 5 was at 15 targets, \$1.50.

First Day, Tuesday, March 8.

The live-bird events of the first day were four. No. 1 was at 10 live birds, \$7, five high guns. Two misses meant out of the money, and those who withdrew missed two. Parker, Fanning and Hallowell being manufacturers' agents were allowed to shoot only for price of birds in No. 1.

No. 2, at 20 live birds, was the international event, fifteen high guns, \$15 entrance, \$150 added. Parker and Fanning shot at 32yds., Hallowell 30yds., the rest from 30 to 26yds. In shooting off the tie Lane, of Rochester, won the medal. The 19s divided the first five moneys.

No. 3 was at 7 live birds, \$7, \$25 added, five high guns. The 7s and 6s divided the money, the others dropping out after two misses. Parker, Hallowell and Fanning were in for birds only.

In a \$2 miss-and-out Marks, Fanning, Young, Emslie, Tripp, Wood, Black, Burkhardt, Easton and Taylor divided the money.

T. DONLEY.

Trap Around Reading.

READING, Pa., March 12.—John Shaaber defeated J. W. Kurtz to-day in a 50-target shoot at the Kurtz House shooting grounds by the score of 37 to 34. The match was for \$5 a side.

The Mt. Penn Gun Club elected: President, Wm. Smith; Secretary, Howard W. Dippery; Treasurer, Albert Yeager; Governing Board: Cyrus Schultz, Geo. Rhoads, Abner Laird, Archie Laurence, Howard Hill. A magautrap may be purchased.

March 14.—At the Three-Mile House a practice live-bird match took place between Brooke Harrison, John Shaaber and George Kuersten. The match was for the price of the birds, each man shooting at 25. The result was: Harrison 23, Shaaber 20, Kuersten 19.

Lititz, Pa., March 10.—In a live-bird shoot here to-day Harry Coldren, of Reading, killed 25 straight and captured first money, beating eight competitors. Sweeps followed at 5 birds and miss-and-outs, in which Coldren also shot and won several events.

Lancaster, Pa., March 11.—In the sweepstake pigeon shoot at McGrann's Park, this city, Harry J. Coldren, of Reading, made straight scores in three events in which he took part. In the first event Coldren tied with Benner in a miss-and-out, killing 6 birds. In the second event Coldren killed 9 birds and divided first money with Fieles and Benner. In the third event, miss-and-out, Coldren killed 5 and divided first money with Benner, Esterly and Fieles.

Pottstown, Pa., March 10.—An interesting interclub shoot was held on the grounds of the Hill School Gun Club, of this city, between the latter club's team and the Shuler Shooting Association, of Pottstown. The teams consisted of six men each, each man shooting at 30 targets. The Shuler team won by the score of 139 to 106. The next match will be shot on the Shuler Club's grounds on March 26. The score was:

Shuler S. A.	High School G. C.
Mills	25
Wickersham	24
Cole	20
Grubb	25
Saylor	22
Davis	23-139
Spear	21
Fox	25
Dupuy	11
Vanderburg	17
Brown	14
French	18-106

Pottstown, Pa., March 12.—Members of the Shuler Shooting Association held an interesting tournament on their grounds. Live birds and targets were used and good scores were made. The events resulted as follows:

FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

TERMS, \$4 A YEAR, 10 CTS. A COPY. }
SIX MONTHS, \$2. }

NEW YORK, SATURDAY, APRIL 2, 1898.

VOL. L.—No. 14.
No. 346 BROADWAY, NEW YORK.

The FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. The editors invite communications on the subjects to which its pages are devoted. Anonymous communications will not be regarded. While it is intended to give wide latitude in discussion of current topics, the editors are not responsible for the views of correspondents.

Subscriptions may begin at any time. Terms: For single copies, \$4 per year, \$2 for six months. For club rates and full particulars respecting subscriptions, see prospectus on page iv.

SECTION 249 REPEALED.

THE New York Legislature has repealed that iniquitous provision of the game law contained in Sec. 249, which permitted the sale of game at all seasons. When the bill to put the section on the statute books was before Gov. Morton in 1895 it was characterized in these columns as "such a blow to the interests of game protection as we have not had in a quarter century." The experience of the years intervening from 1895 to the present has amply demonstrated the accuracy of that characterization. The section has provoked, encouraged and promoted the destruction of game for market of immature game in the spring and summer before the season has opened, and of game helpless in the snows of winter after the season has closed; it has packed to market in close time vast quantities of unlawfully killed game of New York State, and has provided a market for the disposition of unlawfully killed and shipped game from many other States. Its practical operation has been to make a farce of protection in so far as the market side has been concerned. In the vast city of New York there has been for years no game protector. Sec. 249 would have defied and baffled him, and made altogether futile anything he might have attempted. The effect of the law has been felt all over the State. The Fisheries, Game and Forest Commission has now on hand over fifty cases against offenders in various counties, who have been sending birds illegally to New York city cold storage warehouses. The game has been shipped as chestnuts, vegetables, fruits, and what-not; 1,300 birds were sent from one point; in another case a man crossed the line into Pennsylvania and sent the game thence by express. Subterfuges, tricks and devices of various sorts were resorted to by the consignors; but once in the dealer's hands the birds were covered by foreign shipping tags as by an ægis, and the traffic went merrily on without molestation. How much game destruction in other States Sec. 249 has provoked can never be computed; it is enough that New York's office as a receiver of goods stolen from her sister States was keenly felt by upright citizens to be a lasting disgrace.

By as much as the enactment of the section was a blow to protection, by so much is the repeal of the provision a triumph for game interests. By its action in righting this grossest abuse in New York's game protective annals the Legislature has performed the highest service possible in this line. It will now be practicable to read a meaning into the game law; the restrictions as to times of killing, of possession and of selling will amount to something. The statutes to protect may be made to protect. A game protector may now be provided for New York city, and may accomplish something, if he be honest and intelligent and possessed of common everyday gumption. We trust that the Commission will lose no time in assigning to the place a man equipped to fill it. The field is white for the harvest.

The repeal was carried only by the most dogged fighting for it, against tremendous odds, by Commissioner Chas. H. Babcock, of Rochester. There is peculiar satisfaction in chronicling this fact and putting on record Mr. Babcock's part as representative of the attitude of the Commission; because when the original Wilks bill embodying the provisions of Sec. 249 was before the Legislature in 1895, President Barnet H. Davis, of the Commission, and Secretary Doyle fraternized with the New York game dealer Gilman, who was in Albany lobbying for the measure, and worked with him for its passage. Although his attitude doubtless helped the enactment of the measure, our recollection is that President Davis had neither the sympathy nor the support of his associates at that time; and it is certain that the Commission soon came to realize the true nature of the provision as a block to their work. In their report of Jan. 20, 1897, they urged that it "should be repealed, as it puts a pre-

mium upon crime in sister States that have non-export game laws, as most of them have, and is a menace to the game of our own State, and makes it difficult to convict game law violators who kill our game out of season." And again in their report submitted on Jan. 20, 1898, they reiterated their plea in this emphatic language:

Last year we vigorously urged that Section 249 be repealed, as it permits the sale of game the year around, and while that law remains unrepealed it is a hopeless task to protect the game of the State from destruction. We again urge that this section be stricken from the game law, that all of our game animals and birds may not suffer from its blighting influence. We have found it almost impossible to obtain a conviction for killing our own game birds at any time of the year with this section in force, and the law is, as we have already pointed out, unjust to sister States that have non-export laws. Theoretically, the law may be all that its sponsors claim for it, but in practice it is slowly but surely working the greatest injury to our native game.

Early this year Commissioner Babcock entered upon a vigorous campaign to secure the repeal of the law. He recognized, as did his associates, that unless Sec. 249 was rescinded the Commission might as well abandon its game protective activities. The measure was put through the Assembly without difficulty. In the Senate Committee it was held up by Senator Higbie, who is now, as he always has been, a stone wall in the way of right game legislation. Through the personal efforts of Mr. Babcock the bill was finally reported out of committee, to be recommitted for a hearing. The contest that followed was one of the most stubbornly fought in the annals of Albany game legislation.

The New York city game dealers were represented, as in 1895, by the law firm of Tracy, Boardman & Platt. Senator Thomas C. Platt himself by wire and telephone ordered the defeat of the bill. In spite of these odds, by dint of unfaltering determination and personal work, Mr. Babcock set in to win the fight. He got the bill out of committee on the recommitment, by a vote of three to two; and by canvassing votes in the Senate, enlisting the services of his personal friends, he won over all opposition, so that when put to vote the measure went through by a unanimous vote of forty-three to nothing.

The repeal is now in the Governor's hands. Up to the hour of going to press it had not received his signature; but it is not to be doubted that by his approval Governor Black will crown with final victory the struggle which the friends of game protection have been carrying on for the past three years.

HANDS OFF THE AQUARIUM.

ALL persons of feeling who are cognizant of the highly creditable administration of the affairs of the New York Aquarium under the present superintendent, Dr. Tarleton H. Bean, must have sympathy for President Clausen, of the Park Board, in the very unenviable position that gentleman now occupies in public attention by reason of his official action in calling for Dr. Bean's resignation. Under Dr. Bean's direction the Aquarium has been admirably well managed. All competent observers know this. President Clausen knows it. He has frequently and freely borne testimony to his appreciation of the fact. He knows quite as well too that the public interests demand that the Aquarium should continue under the same capable and efficient control. And yet in the face of all this, despite his personal knowledge, and contrary to his personal convictions, Mr. Clausen has demanded Dr. Bean's resignation. He has done this, of course, not of his own volition, but at the dictation of his political boss. He presents the spectacle of a trustee of the people's parks consenting to betray certain of the people's park interests by ousting a competent man from an important position, in order that the place may be given to a political appointee. The part he is compelled to play must be keenly humiliating to one who would keep his own self-respect and retain the esteem of his fellow-citizens.

To meet the storm of righteous opposition to this cool proposition to make political spoils of the Aquarium, President Clausen has given out a statement, reciting that he found the Aquarium "badly ventilated and badly lighted, with an indifferent collection on exhibition, closed to the public for two days in each week on the ground that this was necessary for the purpose of cleaning the tanks, and that the whole service was on extravagant lines, involving an expenditure of \$45,000 a year, which seems to him to be entirely out of proportion to the work done."

Mr. Clausen ought to know, and probably does know, that the construction of the building with respect

to light and ventilation was wholly the work of the Park Board's architect, who not only was independent of Dr. Bean's control, but scouted his advice. As to the character of the collection, the President of the Park Board should know, and take pride in knowing, that New York has to-day what is conceded to be the largest and finest collection in any aquarium in the world. Mr. Clausen's description of it as "indifferent" is nothing less than a confession of his own inexcusable ignorance in the matter.

The Aquarium had for the last fiscal year an appropriation of \$40,000, which was not an extravagant sum, if reckoned in comparison with other aquaria, that at Chicago in '93, for instance. The World's Fair Aquarium was managed by experienced employees of the United States Fish Commission, and it was a small affair contrasted with the New York institution, yet the maintenance account for the six months was \$33,000. Nor is the Aquarium expensive when compared with other like institutions in New York. The Metropolitan Museum of Art and the American Museum of Natural History have each an annual maintenance appropriation of \$95,000. The visitors at the Metropolitan Museum last year, according to Mr. Cesnola's figures, numbered 555,000; the average maintenance expense per visitor was then seventeen cents. With its \$40,000 the Aquarium had in the same year 1,635,000 visitors, at an expense of less than three cents each.

But to discuss President Clausen's makeshift reasons would be beside the mark. They do not truly declare his motive in seeking to get rid of the present superintendent. The real reason is that Mr. Richard Croker wants the place for one of his friends. To make room for him President Clausen has been directed to remove from the position of Aquarium Superintendent the one man in this country best fitted to fill the place.

It is preposterous and outrageous that a position of this peculiar character, requiring special scientific and technical acquirements, and special practical training on the part of its incumbent, should be subject to the office mongering of political bosses. If President Clausen sincerely desires to establish the Aquarium on a secure foundation, and to reorganize it on lines which shall insure for it the widest possible usefulness, let him set about the attainment of the scheme commended by Mr. Fred Mather in our issue of March 9, 1897, whereby the Aquarium may be taken wholly out of the domain of politics and put under the direction of a board of trustees, in like manner as the American Museum of Natural History and the Metropolitan Museum of Art. Under such favorable conditions the institution would come to be not only, as now, an unsurpassed collection for exhibition, but a school of study and research, and as an important marine laboratory, of credit and benefit not only to New York, but to the nation.

Meanwhile, the people of this town should declare with such emphasis as to be heeded even by hungry office grabbers, Hands off the Aquarium!

SNAP SHOTS.

THE text of Senator Hoar's bird bill is given elsewhere. It forbids the importation of birds and bird feathers for ornamental purposes, and prohibits the transportation of birds, feathers and parts of birds from one State to another. A meeting of feather importers was held in this city last Monday to devise ways to oppose the measure. Objections are urged against it on the ground that it would interfere with an important business in which millions of dollars are invested, that it would render worthless the stock already imported for the fall trade, would deprive 20,000 persons in New York alone of employment, and would reduce the revenue of the nation at a time when funds are most needed by the Government. To all of which it may be replied that profitable ways of investing capital may be found, and remunerative avenues of industry may be provided, without continuing the horrible destruction of bird life and traffic in bird skins.

THE exposition given by the New England Sportsmen's Association proved successful beyond the anticipations of the most sanguine promoters. The attendance exceeded all expectation, and the public was thoroughly gratified and satisfied with the extent and variety of exhibits. As an exposition of interesting phases of nature, wild life and game, the enterprise was in every way a credit to promoters, managers and the guild of sportsmen.

Platt-Eye.

SINCE the early part of this century the rice plantations of the South Carolina coast have been noted for the abundance of the game to be found in their vicinity. The gleanings of the rice fields attracted myriads of wild ducks; the adjacent swamps were the natural homes for no end of deer and wild turkeys; the pine woods were well stocked with quail; the small hummocks always had woodcock in the season; and the ricefield trunks enabled the planters to keep the fields in a state exactly suited to the tastes of snipe. The Chesapeake Bay people, indeed, bragged immensely over their celery-fed canvasbacks and their salt-water terrapin, but the rice planters knew the flavor which rice gives to flesh of mallard and teal, and having themselves plenty of diamond-back terrapin, they declared that the big, fat, yellow-bellied cooter and the soft-shell turtle were better before breakfast than the terrapin could be all day; and though the multitude of men and guns have reduced the abundance of game of all sorts, in all parts of the United States, no localities have suffered less than the vicinities of the rice fields. Universally thrown out of culti-

Mr. F., coming home from his rice fields, was told that Joe and Jack Bush had just killed an ox near his cow-pen, and were even then butchering it. Taking his gun, he went there, and as he approached he was fired on with a load of buckshot and killed. Naturally there was a hue and cry among the neighboring planters to catch Joe and Jack Bush; but as some time passed without their being able to find them, one of the neighbors, a Mr. Huggins, thought to utilize as a detective one of his negroes, named July, who occasionally went on a little runaway, as a toper who has acquired the habit will go on a spree. An attractive reward was offered July, and he ran away. Some two weeks afterward he came secretly to Mr. H. at night and told that Joe and Jack were hidden in a large swamp, called Kilsnook Bay, but that they were uneasy and had planned to come the next night to South Island and steal a boat and cross to North Island, and thence perhaps to the main. South Island could only be reached by one road, over a large causeway, and Huggins next day planned with eleven of the neighboring planters to ambush the road that night at the head of the causeway.

That something remarkable took place during the night with the ambushing party was known to every-

returning. As it came opposite all twelve again fired, but again it passed on. Then they got out in the road to look for tracks, or blood, when it was seen returning. They faced it in line and all fired again. Through the smoke one man saw a figure coming directly on him. He jumped out of the road into a shallow ditch on the side, and the figure passed on and was seen no more.

Now this story would have seemed far stranger to me than it does had it not happened that between 1861 and 1865 I had a good deal of experience of the ability of a few men watching together at night, and with guns in their hands, to see something to shoot. Two men will certainly see four times as much as one man, and I think twelve men will see 144 times as much; so if we can account for about 1-144th part of the mystery we may let the other 143-144ths take care of themselves. But even the 1-144th part was worth looking after, and one day, out on a camp hunt with Adam, a man of color, an old trapper, and very learned in all the ways of all varmints, natural or unnatural, I asked him: "Adam, did you ever hear of Joe and Jack Bush?" "Oh, yes sir," said Adam, "I hear of them ever since I been born. They scare had children with them way down till after the war; tell them 'Joe Bush catch you.'" "Well, Adam,

THE INDIANS OF THE NEW ENGLAND EXPOSITION.

vation during the war, and their owners impoverished, not one-fourth of them have even yet been restored to civilization. Off the lines of travel, and with a very sparse white population, there is still to be found about them not only an unusual amount of the game of former days, but also among the colored population many of the superstitions and customs of the days of slavery, which have entirely passed away in communities where the whites have been in greater proportion. It is still not a very rare thing among them for a healthy person to die, apparently, solely from a conviction that he or she has been hoodooed by some expert in this secret art. And it was among them that the writer, though born and raised and always living in the cotton belt of the South, quite recently first heard of the "Platt-eye," a mysterious creature whose habitat seems limited to the rice belt of South Carolina, and about which the reader will know more, perhaps, when he has finished this story.

And it will contribute to that end if I tell how I first came to hear of him. It was in the investigation of a story of a very strange affair, in the early 20s, which still survives, both among white and black, in the vicinity of its occurrence.

A plantation famous in those days, both for its abundant game and for its great rice crops, was South Island, lying between the Santee River and Winyaw Bay. The rivers draining the greater part of South Carolina, and a wide belt through North Carolina into Virginia, discharge into the sea on the two sides of the island. So much fresh water permitted an immense area bordering the rivers to be planted in rice, and wherever the food is the game is gathered together. The owner of the plantation was a Mr. Ford, and two of his slaves, Joe and Jack Bush, had for some years been runaways and outlaws, living in the swamps, whence they made forays to supply themselves with what they wanted, either from white or black. One evening about dark

body, white and black, by the heavy firing which was heard; but Joe and Jack Bush were not captured, and some months afterward, when Joe was killed and Jack wounded and captured, as will be related presently, he told that he and Joe were indeed coming that night, as July had said they would, and that they were within a mile of the spot when they heard the firing begin. Naturally they took another direction and kept themselves safe for many months; then, having once successfully robbed a trading boat on the Santee River, they incautiously tried to repeat the operation. But the second time they struck upon a decoy boat fixed up to catch them, and Jack was finally hanged at Georgetown for murder.

That is the end of the story and of Joe and Jack, and now we will go back to the night of the ambush, for there is where Platt-eye comes in. The ambushers either could not or would not tell, generally, any definite story of their experiences. Tradition has it only that they saw "something" and shot at it in vain. But I received the following details in a quite direct channel from one of the participants, a Mr. A. My informant was a Mr. M., who when a boy had been very intimate with a son of A. This son died, and young M. sat up with the body the night before the funeral. During the night he asked Mr. A. about this ambush, and Mr. A. told him the story of what happened, as follows: The ambushers were all on the same side of the road, behind the scattered tall pines, or crouching in low grass. The night was clear, but with no moon. About midnight the man at the end of the line, in the direction where the Bushes were expected, saw a figure passing along the road. He hailed it, and getting no answer, fired both barrels at it. The figure passed on, and all the rest fired both barrels as it passed, and all without effect. Loading quickly, they got together, discussing how they could have missed, when suddenly the figure was seen

did you ever hear about the planters trying to ambush Joe and Jack, and shooting at something which they could not hit?"

"Oh, yes, sir; the colored folks knowed all about that. They hearn the guns."

"Well, Adam, what was that they shot at?"

"That? Why, that was jest a Platt-eye."

"A what?"

"Why, a Platt-eye."

"Well, Adam, what is a Platt-eye?"

"Well, sir, you see in them days there was heap of mighty smart people among the colored folks, and they knowed all about root work; and the Platt-eye was something they made to protect themselves against the patrollers, 'cause the planters would sometimes patrol the roads at night to keep the people from going about to other plantations; so the Platt-eye was something—it might be like a big bird—to come and light on your head and flap you with its wings; or it might be like a dog, and come and run between your legs and trip you up. But you hit at it, and you just knock yourself; you fight it, and you beat yourself almost to death. Then it can change itself. First it might be an old sow, and after it tangle you all up and make you most kill yourself, it might change to a cow and trample all over you shameful. That was what one did to a man on the Maxwell place once, and it pretty nigh ruined him."

"Why, Adam, are there any about here now?"

"Oh, yes sir; you see them old-time people, they made 'em, and they left them about in places, and they stay around there yet. I'll tell you where one stay. You know that hole where they digs clay to clay the seed rice with, just beyond the Daisy Bank place? Well, one stay right about there."

"Well, Adam, did you ever see one?"

"Lor, yes, sir; I seen 'em heaps of times; but they can't hurt me, 'cause I knows how to do. All you got

to do is to get mad; you mustn't get scared—just mad. I'll tell you when I seen one. It was when I was courting my present wife Eliza, just early in last year. 'Twas one Saturday night, and after I got paid off I start to the island to see Eliza. 'Twas a little cloudy and a new moon, and that's just the time for 'em. New moon and a cloudy evening is what they likes. As I come along there where the eight-foot ditch joins on to the pine land I see something like a calf coming up on my left-hand side. That's them. They always got to come up on your left-hand side. Soon as I see him I know him, and I know what to do. I just got so mad nothing couldn't hold me. I just throwed myself flat down on my face on the ground, and I put my hands over my eyes, and I tell you, sir, I was mad through. And as I laid there I got madder and madder. Then, after some good little time, I didn't hear nothing, so I look up, and, sir, he done gone. He know he couldn't make nothing projecting around a man mad like me, so he go off somewhere else. Then I get up, and I done lost so much time I has to hurry to get to see Eliza."

As before stated, Adam is a past master in the wiles of all varmints. If he sets a trap in a ten-acre field no fox, coon or possum can get through the fence and keep his foot out of the trap. A cow-pen full of Sherlock Holmeses could not penetrate a ten-year-old pick-pocket in a month as well as Adam will in a minute the innermost soul of anything that travels by night, from a hoodoo to a house cat, let him find hide, hair or hackle of it. So if any reader is approached on the left side by any appearance looking as if it might have business with him, when the moon is young and the evening cloudy, he will make no mistake if he permits his angry passions to rise. And the higher the better. And for a furious and enraged attitude, one calculated to terrify even a supernatural, flat on one's face seems to be what will take the cake. JACK HILDAGO.

Some Yukon Notes.—II.

(Continued from page 242).

In the latter part of September a great many ptarmigan were killed on the summit of White Pass. The first heavy snow falls brought them down from the neighboring peaks and highlands. They were very tame, and easily shot with a revolver. In fact I know of cases where they were killed with stones. They were fat and plump from their rich feed of berries and a delicious change from the coarse food of the trail.

One morning at Summit Lake as I came out of the tent I noticed fifteen or twenty ptarmigan squatting in the snow on a little ridge a few rods away. I borrowed a rifle, and in company with another man who had a shotgun we killed eight in a few minutes. Ammunition was scarce or we would have taken in the entire flock.

Before the snow came whistlers and gophers, so called, were plenty about the summit. The whistler resembled a large woodchuck and the gopher was very similar to other gophers, except that it was larger than any I had previously seen. Whistlers and gophers were both good eating, and I managed to pick up quite a few along the trail. One day while portaging from Summit to Middle Lake I killed two gophers on the same rock near the height of land. Returning a little later I saw two more at identically the same spot, and killed both.

Ducks were numerous in the chain of lakes near the summit, and from time to time geese also made their appearance for short periods.

All night long while camped at the head of Summit Lake in September one could hear the whistle of ducks' wings as they flew low down through the narrow cleft of the pass. On foggy days and in the evenings or mornings one could get very good flight shooting at this point, and the tents of the little encampment were frequently bombarded with dead ducks. Fogs in September are the rule at Summit Lake, as any one who has been there will testify. Up to the time of the river closing in November the ducks were also very numerous along the Lewis and Yukon. A friend of mine picked up six mallards and two canvasbacks in half a day's run above White Horse Rapids. The duck shooting at Dawson was said to be good. For a run down the river in the fall months a shotgun should be carried rather than a rifle.

Ravens, or crows, as they are commonly called, are very numerous along the river. These birds attain a very large size. One killed by a Mr. Lamothe at the foot of Lake Lebarge measured 4ft. 2in. from tip to tip. This Lamothe, by the way, is the man who found Colgate's bones on the Bitter Root the summer after the Carlin expedition. His description of the discovery is one of the most gruesome pieces of realism I ever listened to. He chanced to pick up in the sand drift from the river which covered the old camp site the two bones of a human leg and remarked: "I have killed all kinds of animals—moose, caribou, deer—but I never see two bones stick together before like this." And then he entered into a minute description of the ligaments attached and the evidence that bears had dismembered the corpse, and wound up by showing Colgate's gun with two empty shells in it to corroborate a theory of suicide, which he advanced, en passant, in conclusion of the whole ghastly affair.

To return to the subject, the ravens are found along the river all winter. At the very summit of Chilcoot Pass one of the coldest days of the winter (Feb. 3), while the wind was blowing strong men off their feet and freezing others to death, I saw a raven battling the gale. North of the summit, where there was comparative calm and only 30° below zero, we had passed a gorged raven hopping along the hard snow trail, and avoiding till the last moment the necessity of taking to wing.

At Fort Selkirk the ravens quarrel with the dogs for the beef heads, which are daily thrown to the latter for food. They fly up and down the course of the frozen river, looking for the refuse of sledding parties, and at Five Finger Rapids I saw the ribs and the upper portion of what looked remarkably like a human trunk picked clean by these same scavengers.

They have great powerful beaks, built up on top in

such a way as to give the raven an overwise expression. It seems as though they were looking over spectacles. Incidentally it seems next to impossible to poison these birds. They will take all the strychnine you can feed them, and seem to thrive on the diet. I put out twelve baits one evening on the snow-covered surface of a slough intended for foxes or wolves, each containing a pretty stiff dose of poison. I took the precaution to kick a little snow over the baits to keep the ravens from finding them, but my trouble was without avail. The next morning a raven came along, and alighting at each spot devoured the poisoned morsel. An uncanny intuition, guided by a marvelous sense of eyesight, had directed him to each spot where a bait was hidden, and I could not see that he had alighted once on my trail where there was no bait. As a matter of fact only one bait at the extreme end of the line had escaped him.

And yet I could not find any evidence to indicate that he had succumbed to the poison he had taken—enough to have killed a dozen wolves.

As luck would have it, the one bait which escaped the raven was taken by a fox a few days later. The first intimation of this fact came to my partner, who was cutting logs near the river for our cabin. He reported that he had seen several ravens alight on a sandbar a short distance away, and I told him he had better go up there and see what they had. When he returned he was carrying the fox, a red, or rather lemon yellow specimen. In its side was an ugly wound made by the ravens. The fox was still warm, and had apparently only been dead a few minutes.

In all, we saw seven or eight foxes while going up and down the river. They seemed to us to be very plentiful, but the Indians say it is an off year with them, owing to the scarcity of rabbits. The varieties are the red, cross, black and silver gray. The Indians say they get \$50 to \$75 for the skins of the latter.

Rabbits at the Pelly were almost as rare as snakes in Ireland. One of the periodical plagues—or migrations, whichever it is—had carried them off, and one could travel for miles without seeing a track. Above the Thirty-Mile River, however, they were more common.

A man camped about the middle of Lake Marsh, on the west shore, told me he had snared seven. He said they were pure white and very small.

At Tagish Inspector Strickland told me last fall that he had killed several.

It is said that it will take four or five years to restore them to their maximum numbers on the lower river.

Red squirrels are very abundant along the whole river. A man with a .22cal. rifle and a few thousand rounds, of ammunition could easily support himself on red squirrels alone. They evince no tendency to hibernate, and may be seen feeding at their favorite pile of spruce cones when the thermometer stands at 50° or 60° below zero.

Several species of grouse are found along the river, but as far as my observations go they are nowhere plentiful. The Indians call them indiscriminately chickens, and I believe they also include ptarmigan in this term.

Among the smaller birds noted in the neighborhood of the Pelly in midwinter may be mentioned Canada jays (moose birds), magpies, hairy woodpeckers, snow buntings and chickadees.

As a curious instance of the temerity of the jays may be mentioned the fact that when coming down the Thirty-Mile River one flew out from shore and alighted on my partner's yellow slicker hat as he was rowing his boat in mid-stream. Some fresh meat in the stern of the boat probably attracted the bird.

At the lowest estimate 4,000 rifles were taken into the Yukon country last fall by white men, and yet, aside from the mention of caribou, which I shall make a little later, I only heard of one instance where these weapons were profitably employed on members of the deer tribe. This was by Mr. Curtis, before mentioned, who killed a bull caribou weighing 350lbs. while prospecting on the upper McClintock River. Moose and caribou are no longer found in the immediate neighborhood of the main river. The Indians, who rely for their support in winter mainly upon this game, go back three or four "sleeps" to reach their hunting grounds. A "sleep" with these Indians is anywhere from six to ten miles. They are slow travelers, making camp early and breaking it late. It takes them three or four hours to erect their bough wind-break, roofed with drilling on the plan of a lean-to camp, and get in a supply of firewood for the night. Their clothing is generally insufficient, and some of the little ones may be seen around the camp-fire in midwinter bare-legged and almost naked. This necessitates keeping the fire going all night, and as their axes are generally small it takes time to get the necessary supply of fuel. On such trips the actual hunters are in the background, the spectacular effect centering in the dogs, women and children.

Last November when we had our boats carried away by an ice jam we thought for a while we should have to adopt the Indian's mode of life, but fortunately after a two weeks' search we succeeded in recovering our boats and supplies fifteen miles below the point where they had disappeared in the grinding floe which throttled the river. This obviated the necessity of locating a caribou herd and following it up all winter along with the wolves and ravens—a method of earning a livelihood which did not appeal very strongly to our imaginations. It is just as well that we escaped this necessity, for caribou are nowhere found in their accustomed haunts this winter, and the Indians at the Pelly, Nordenskold, Big and Little Salmon, and elsewhere all claim that they are starving.

North of Dawson, however, a great herd of barren ground caribou has recently appeared. My informant, who left Dawson shortly after the new year, says that the herd was estimated to number 10,000. It was last seen near the head of Twelve-Mile Creek, on the divide above the timber line, heading west toward a range of rocky, snow-clad mountains. Jim Taylor, of Seattle, is reported to have killed forty-five caribou from this herd, and my informant helped to pack the carcasses into Dawson. The best looking hunting country for moose or woodland caribou that I saw is that lying along the Lewis, between the Big and Little Salmon Rivers. Here the hills are wooded from base to summit with an ever-green growth, while summer feed is furnished by wil-

low copses and a bench growth of poplar and deciduous undergrowth. Lower down the river there is a vast extent of absolutely barren country—a desolate waste of stone and sand that offers no rest to the eye, because utterly lacking in lines of repose. The prospect away from the river is a jumble of angles, unbroken by graceful curves or suggestive horizontal masses. Aside from the islands in the river and the shore immediately contiguous there is no timber worthy of the name.

The land away from the river is too poor and cold, and geographically too much on edge, to rear anything but a scrub growth, and even that is lacking in many places. Nor is there anything grand or sublime in the scenery of the Yukon above Dawson. The great snow-capped and glacier-clothed pinnacles of the coast range have disappeared altogether, and a petty, good-for-nothing upheaval of the earth's crust is all that remains.

Game never could have been abundant in such a country, and it is not therefore surprising to find it such an uncertain quantity at the present time.

As regards edible varieties of fish the region in the neighborhood of the White and Chilcoot passes is well supplied, and the same is probably true of the lower river. A trout resembling the Dolly Varden was common in the Skagway River, and just over the divide at Summit, Middle and Shallow lakes trout and grayling were taken on bait and fly in considerable numbers almost up to the time of the lakes freezing.

A gentleman, who said that he was collecting specimens for the Smithsonian Institution, caught several large trout by wading out on the bar where the stream comes in at the bend of Middle Lake, using a fly. The largest of these weighed 8lbs. and was identified as a Bailey-Grohman trout—a new species named after the English sportsman who first brought it to the notice of the public a few years since. It was one of the silvery gray class, a rather coarse-looking fish, with large head and crocodile jaws.

At White Horse Rapids Mr. Kline, the engineer in charge of the construction of one of the tramways, told me that the Indians get trout weighing 25lbs. all winter. The water is open at the present time, and the Indians get their fish with lures and spears, as well as by netting them.

In the big lakes—Bennett, Tagish, Marsh and Lebarge—large pike are common, while whitefish are very numerous. This applies especially to lakes Marsh and Lebarge. Probably Marsh is the best fish lake of the lot, as it is the shallowest and has the best feeding grounds. The white colony at the foot of this lake have all the fish they can eat from a few 40ft. gill nets stretched between two holes in the ice.

Dog salmon run up the river in the fall as far as White Horse Rapids, but they are unfit for human food, as a result of their long journey from salt water. There is said to be an early run of king salmon almost to the same point, and the Indians preserve these for food.

I saw a number of grayling or arctic trout, as they are called, caught in the rapids at the head of Shallow Lake. They ran in weight, I should judge, from 6oz. to 1½lbs. They preferred a modest colored fly to any other bait, natural or artificial. Home-made flies, manufactured from grouse feathers, seemed to be particularly killing.

Natural History.

East African Mammals.

BY D. G. ELLIOT, F.R.S.E.

(Continued from page 224.)

SOEMMERING'S GAZELLE (*Gazelle soemmeringii*). NATIVE NAME, Aoul.

THIS fine animal has become scarce in most parts of Guban. A few years ago it was very plentiful in the Maritime Plain, but was so persecuted by hunters of every degree that at the present day it has retired into the interior, and is not met with in any numbers until the country south of the Golis Range is reached. The aoul is not a graceful animal, nor is it built on fine lines, the short neck, rather clumsy head and heavy body giving it a very different appearance from the idea generally entertained of the light-footed gazelle. This species goes in herds, sometimes several hundred are seen together, and naturally it is not particularly suspicious or wild, but of course when much persecuted the animals become very wary. They are apparently independent of water, and are frequently met with many miles from the place where it might be obtained. The entire country is so destitute of water that under the most favorable circumstances the wild animals must have difficulty in procuring it, and as there are no rivers between the Shebeyeleh and the sea, the natives get their supply by digging in the dry beds of the tugs, or rivers. Of course the animals cannot do this, and they must depend upon the chance pools they meet with, left by the rains, and are easy to approach even on the open plains; that is, close enough for a fairly near shot, something over 100yds. Of course many times it will be necessary to shoot at much greater distances than this. Among bushes it is not difficult to get very near one of these animals if stalked with knowledge and judgment.

It does not seem to make much difference to this gazelle what kind of country it dwells in, whether thickly covered with trees and bushes, or on bare plains; but I think it prefers the latter, and congregates in much larger herds in such a locality than in any other. But it cannot be considered as distinctly an animal of the plains, as for instance the hartebeest is. Aoul can be distinguished for a long distance, the large white patch on the hindquarters always showing very distinctly and causing them to be recognized from the other animals associated with them without difficulty. They are almost always seen with the herds of hartebeest, or oryx when these last are out on the plains in any numbers. This gazelle runs with great speed and has the habit of jumping often to a considerable height and for long distances when in full flight.

Possessed of considerable curiosity, aoul will always stop after going a short distance, and turn to look at the

cause of their fears, and sometimes individuals will stand for a considerable time, giving the hunter a good opportunity to shoot at them. Although large for a gazelle, the body presents but a small mark, and the bullet must be placed in some vital part or else the animal will escape, as it possesses great vitality, and a broken leg does not seem to incommode it in the least, nor prevent it from running at full speed on the three that are unhurt.

Both sexes carry horns, and these vary greatly in length and shape. Sometimes the horns of a male will measure 20 in. and even more along the curve, but the average length is much less, something like 14 in. The smaller pairs, however, are much more shapely than those of the extreme lengths, the latter losing much of the characteristic graceful curve.

Aoul seem to be generally distributed south of the Golis Range, and we met with them almost everywhere, being very plentiful in parts of Ogaden. On the Haud they seem to restrict themselves mostly to the plains, where they are seen in large herds.

CLARKE'S GAZELLE (*Ammodorcas clarkei*). NATIVE NAME, *Dibatag*.

This rare species is only met with in the country south of Toyo Plain, and then eastward to the land of the Dolbahanta. It does not seem to be very numerous even in the localities it frequents, at least that was our experience, and we found it to be the most wary and difficult of approach of all the animals we hunted. It is not easily seen among the bushes, and it has the habit of concealing its body behind some bush and looking at you over the top, which its long neck readily enables it to do. The neck is so slender and the head so small and pointed, and its peculiar purplish gray glossy coat matches the high grass so well, that the animals are almost invisible, and it takes one quite a little while at times to distinguish them. Then they know at once when you discover them, and are off, and present so small a mark that they are very difficult to hit. At a distance, when they stand facing one, the neck does not look wider than a twig, and one has to shoot very straight indeed to secure a specimen of this wary, active species. Although very different in appearance from Waller's gazelles (*Lithocranius walleri*) when brought close to each other, yet at a distance it is not always easy to distinguish them if not in motion. But the moment a dibatag starts to run there is no mistaking the species to which it belongs, its movements being so entirely different. Instead of the low, slouching gait of Waller's gazelle, the dibatag bounds away with head and tail well up, the former inclining slightly towards the latter, clearing the bushes at every jump in the manner of the lesser koodoo (*S. imberbis*). I have never seen it carry its head and tail when running so that they nearly touched each other, as some writers have described, but on the contrary the tail is carried straight up in the air, and this alone, from its length, would at once distinguish the dibatag from the gerenuk at any distance. It has the long neck and peculiar physiognomy of the gerenuk, both considerably giraffe-like, and the two species inhabit the same kind of country; but I have never seen them associated together. As mentioned by Swayne, it frequents the jungle of the umbrella mimosa, and glades of durr grass, often taking refuge in dense high patches of this last, especially when wounded. The horns of the male are peculiar, and shaped more like those of a reed buck, and measure from 8 to 11 in. along the curve. The female is without horns. The dibatag is a gracefully formed, beautifully colored animal, and possesses more sporting qualities than any antelope we met with, unless it might be the two species of koodoo, particularly the lesser koodoo.

WALLER'S GAZELLE (*Lithocranius walleri*). NATIVE NAME, *Gerenuk*.

This is the most frequently seen of all the antelopes inhabiting Somali-land, save perhaps the various species of Dik-Dik. It is also the most peculiar in appearance, the exceedingly long neck, large eyes, lengthened muzzle and general shape of the face being very like a giraffe. It is not a graceful animal in its movements, but walks along in a slouching sort of way, and when startled drops its head on a level with the body and sneaks off among the bushes, in a very different manner from the gallant way in which the dibatag removes himself from the object of his fears.

The gerenuk goes in small troupes of from three to eight or ten individuals, and is found usually on rocky ground broken with ravines and covered more or less densely with bushes and trees. It is a browsing animal, and is often found in localities where grass is partly or wholly absent. It has great curiosity, which failing is often fatal to its safety, and when it sees an unusual object, a hunter for instance, will stand and gaze steadily for some moments without moving. If one is not near enough for a shot, these are trying moments to a hunter, who is obliged to remain absolutely rigid until the gerenuk commences to feed or is satisfied there is no danger; otherwise at the slightest motion the head is ducked behind the bush and the animal sneaks away. As a rule, however, it does not go far, and I never saw a gerenuk that I could not eventually secure, if I determined to have it. It was only a question of a little time and patience, and an approach to a fair shooting distance could be gained. I consider the gerenuk as rather a stupid animal; certainly it does not seem to possess the wariness, watchfulness and general ability to take care of itself which are common attributes of all other species of gazelle. The meat is poor, being like the flesh of all other game animals in Somali-land, without a particle of fat, and consequently dry and tasteless. Only a few of the natives will eat it, as they consider it looks too much like a camel, and have certain superstitions regarding it. The males carry rather handsome lyrate horns, the largest measuring something over 14 in. along the curves. The females are hornless. The gerenuk is never seen on the treeless plains, such as are met with on the Haud; at least I have never observed them in such places; but I have found them on barren, rocky hillsides and summits, the valleys between which, however, were covered by a thorn forest. In such cases the animals were probably merely passing from one valley to another. The usual gait of this antelope is a slouching trot, with the head and neck carried very low, level with the body, and when frightened it gallops with considerable speed, stopping, however, at intervals to

look back at the object of its alarm; and if at such times the hunter is concealed the gerenuk soon forgets its fear and commences to feed or walk slowly along. The male of this species stands about 4 ft. 6 in. high, a considerable portion of which is due to the long neck.

Certain individuals of both sexes of this species have on either side of the face a whitish stripe between the eye and end of nose, resembling very much the markings of Clarke's gazelle (*Ammodorcas clarkei*). This was particularly the case with individuals shot to the south of Toyo Plain, where it was rare to obtain one without this conspicuous mark. The animals also were larger than their brethren in other parts of the country to the north and west. I was impressed with this peculiarity, and should have considered it of some value if it had been confined to individuals from one section of the country, but on careful examination of the specimens obtained on my return to the north of Toyo I occasionally found one with this stripe indicated along the nose, but not so clearly defined as is generally the rule in the individuals from the south of the plain. When clearly marked it gives the head of Waller's gazelle a very close resemblance to that of Clarke's gazelle, as both have similarly shaped faces, very narrow and pointed. Taking the extremes of the two styles, the strongly marked white stripe, and its almost total absence, one would be likely to imagine that there were two well-defined races of Waller's gazelle. This species has in front of the eye, filling up the antorbital vacuity, a black secretion which forms a large, conspicuous prominence on each side of the face. The only other animals in which I have seen this carried to an equal degree, allowing for their comparative size, are the Dik-Diks. There is a small opening in the center of this sac-like prominence, from which the secretion exudes and stains everything it comes in contact with, the same as ink would. Neither the skin, when removed from the animal, nor the skull, give any indication of this prominence, and so the creature when mounted, or in a drawing given of it, presents no resemblance, so far as the face is concerned, to the living animal; those specimens I have seen in the museums have this part laid flat to the skull and painted white, being more of a caricature of the live gerenuk than anything else. In life this gazelle is a fine creature, graceful in form if not in movement, and having an extraordinary structure of face and peculiar expression, which cause it to be a rather unique species among its allies in the family.

[TO BE CONTINUED.]

Congress and the Birds.

ON March 24 the Senate passed Senator Hoar's bill to protect song birds, which reads as follows:

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That the importation into the United States of birds, feathers, or parts of birds for ornamental purposes be and the same is hereby prohibited; provided, however, that nothing herein contained shall be construed as prohibiting the importation of birds for museums, zoological gardens, or scientific collections, or the importation of living birds or of feathers taken from living birds without injury to the bird. The Secretary of the Treasury is hereby authorized to make regulations for carrying into effect the provisions of this section.

Sec. 2. That the transportation of birds, feathers, or parts of birds, to be used or sold, from any State or Territory of the United States to or through any other State or Territory of the United States is hereby prohibited. Whoever shall violate the provisions of this section shall, upon conviction in the district where the offense shall have been committed, be punished for each such offense by a fine of \$50.

Sec. 3. That the sale, keeping, or offering for sale, within any territory of the United States, or within the District of Columbia, of birds, feathers, or parts of birds, for ornamental purposes, except such as are excepted in the first section of this act, be and the same is hereby prohibited. Whoever shall violate the provisions of this section shall, upon conviction, be punished for each such offense by a fine of \$50.

Dr. Bean and the Aquarium.

Fred Mather in FOREST AND STREAM, Nov. 20, 1897.

I AM freely giving expression to personal views on the management of the present New York Aquarium, because I believe that great improvements can be made in it if it is taken from the control of an ever-changing Board of Commissioners of Public Parks, appointed by a Mayor who is in office for four years, and placed under a more permanent board of trustees, who may be selected by reason of their interest in, and knowledge of, matters directly or indirectly connected with fishes, and who have some idea of the difficulty in the way of managing an aquarium, and do not expect miracles of a superintendent, as some newspaper writers seem to do. To superintend an aquarium is a trying position and requires an education in that particular line. A man who is only a fishculturist knows how to keep the few fish he has transported in cans alive, but that does not fit him to care for the food and temperature of migratory and tropical fishes. The ichthyologist and the closet naturalist, who can tell you every variation in the anatomy of fishes, is the surest man to blunder when he enters the field of aquaria, and if I had to choose between these two I would take the first, but would want to put some old net fisherman with him to tell him some things he might not know. The ideal man for a superintendent is one who is both fishculturist, naturalist and old fisherman, with added experience in aquaria; and such a man is Dr. Bean, and you may count over the fingers of one hand without finding one who possesses all these qualifications, even if you've lost a few fingers in a saw mill.

St. Louis Bird Notes.

MARCH 14.—Seen to-day in Forest Park robins in flocks, bluebirds, meadowlarks, a phoebe bird, sapsucker, red-headed woodpecker, yellow hammer, and small flocks of blackbirds, besides peep frogs, flies, white millers and a yellow jacket.

C. H.

Season in Central New York.

ITHACA, N. Y., March 18.—*Editor Forest and Stream:* The oldest inhabitant stands amazed. The fine old man has put his recollection into a great turmoil, but so far we can call to mind no recent year that has fathered such a mild and quieting March as the one from whose back steps we are now about to make our adieu. Robins, bluebirds, song sparrows, purple grackles, etc., have made their appearance, and the 12th inst. the writer observed plenty of toads abroad and heard the choir invisible peeping vociferously from the Ithaca marsh. The peepers have been heard repeatedly since. Elm trees are putting forth tiny leaves, lawns are rapidly greening, and all nature seems freshening and springing into new life under the magic of the March sunshine and showers. Game birds have no doubt wintered nicely, and under favorable nesting conditions the grouse supply should be satisfactorily replenished. A few ducks have put in an appearance upon the marsh waters, but no shooting of consequence has thus far, happily, been indulged in.

M. CHILL.

Mammals of New York.

THE New York State Museum has engaged Mr. Gerrit S. Miller, Jr., late of the Biological Division of the U. S. Department of Agriculture, to make a study of the mammalian fauna of New York and prepare a record of the mammals existing there at the beginning of the historical period.

Particular information is needed with regard to the panther, wolf and elk, which existed in the State, and of which the specific identity is at present uncertain, as there are several animals which have been called by these names.

All persons possessing skulls or complete skeletons of these animals, which they know to have been collected in the State of New York or in its immediate vicinity, are requested to communicate the fact to Dr. F. J. H. Merrill, Director, N. Y. State Museum, Albany, N. Y.

Linnaean Society of New York.

A PUBLIC lecture in the lecture hall of the American Museum of Natural History, "Protective and Directive Coloration of Animals," by C. Hart Merriam, M.D., Chief of Biological Survey, United States Department of Agriculture, will be given on April 7. You are cordially invited to be present.

WALTER W. GRANGER, Sec'y.

Pennsylvania Spring.

EDDINGTON, Bucks County, Pa., March 24.—Snipe and ducks are flying around here pretty lively; a few woodcock are seen, and shad and herring are in the river. Spring has been pretty well advanced, but we may suggest some tough weather yet.

Game Bag and Gun.

Ducks.

HE told me ducks—this friend of mine—and in the joyous ingenuousness of youth I ignored his profession of the law, and gave heed.

"Go down to Forked River," said he, "and they are yours—yours for the shooting."

Pursuant to direction, I invested dollars of the realm in nameless hundreds of shotgun shells, and journeyed south to Barnegat. Here at Forked River an affable youth—Peggy Worden by name—met me at the railroad station, and considerably relieved me of 14 lbs. of cartridges, a 12-bore gun and a handbag that weighed 28 lbs. when it started and 718 lbs. 15 oz. when it arrived.

"Ducks?" murmured Master Worden. "Well—oh, I guess so."

In the ignorance that is bliss I gloried in his words. The subsequent coming of wisdom convincing me of my folly. For of all things that are folly, enthusiasm is the greatest, and whoever has shot or fished has met this folly face to face, and will continue in the meeting to the end of all time to come.

However, to resume:

"I'll be around at 3 A. M.," said Master Worden, "cause it'll take an hour, I guess, to work down the creek 'gainst the tide."

With this he departed for the night, leaving me to discuss ducks with him that keeps the hotel—the Lafayette House of fame.

"Ducks," said my host, reminiscently, "well, I dunno. Ducks are not what they used to be. My boy, he's gone down to Harvey Cedars shooting; he's after ducks too."

The fact that one who was on the scene had gone elsewhere for ducks instilled a small but somewhat potent suspicion in my mind that all things were not as they should be; but as hope springs eternal, I retired with visions of large flights of brant strolling in to their fate, the same fate being represented by a 12-bore gun trained by myself.

It was 3 A. M., as arranged, when Master Worden returned. It was 3:15 A. M. when I appeared in the presence of a large and entertaining breakfast. It was 3:30 A. M. when the breakfast had disappeared into that bourne from which no breakfasts return; and it was 3:45 A. M., and as dark as the depths of an African coal mine, when we reached the landing.

"Will a hundred shells be enough, Peggy?" I asked, tentatively.

After recovering from a short and violent convulsion Peggy guessed it would, and with that produced a sneak-box from somewhere or other, but considering the nature of its size, probably from his hat or his waistcoat pocket. Perched upon the stern washboard of this microscopic craft was an array of decoys, redheads, brant, broadbills and other alluring birds.

"Gwank! Gwank!" said Peggy, looking over the array; "can almost gwank themselves, those decoys."

Reminiscences of an Old Sportsman.—XI.

My Private Covers.

WHAT sportsman who has had much experience has not discovered at least one El Dorado where, according to his best belief, other sportsmen have never been—where game is plentiful and confiding, and all the surroundings are in perfect harmony, making the secluded spot an ideal Arcadia that causes him to hug himself in delight at the good fortune that has come to him? How he gloats over the enticing allurements that gladden his eyes as they rove from the emerald that is spread with lavish hand among the alders that grow so luxuriantly along the little brook to the gentle birch-covered slopes that trend with graceful undulations toward the inviting and gamy-looking copse that borders the larger growth of woods beyond. How his heart swells with pleasurable emotions as he gazes upon the beautiful picture spread before him, and as he treads with buoyant step the springy turf beneath the alders, and wanders among the white-armed birches, or threads his way through the dense copse, greeted at nearly every turn with the querulous whistle of startled woodcock or thunderous roar of swift-winged grouse, his whole being is filled with an ecstasy that words cannot portray. Our fortunate friend may have stumbled into this bonanza, or perhaps he finds it by persistent search that has taken him over hundreds or thousands of acres of comparatively barren ground, at the cost of many days, and many a fatiguing tramp. If he has found it without much trouble, he may well bless his lucky stars; but if the find is the result of systematic and long-continued search, it is with greatly enhanced pleasure and pride that he surveys the rich domain now all his own. How he gloats over the beauties of his newly found treasure, and revels in thoughts of the wealth of sport that awaits him here when in his own good time he shall revisit the spot.

Many such places have come to me, but in a very large majority of cases accident had no share in their discovery, as I was ever searching for new grounds, in hopes to find something better than those I knew. Not that birds were scarce, or that fault could be found with the covers, but there was something in my nature that led me on, and I was never so happy as when, in exploring new grounds, I came upon something in the way of game or country that approached my ideal.

In the early days of my shooting there were several excellent covers in the town of Ashford, Conn., that

I often visited, and nearly always found an abundance of birds. These covers I had worked hard to find, and had tramped over a large extent of comparatively barren country, finding an ideal run or bit of birch cover occasionally, just enough to lead me on, until I had found sufficient to give me all I could attend to in one day.

I was once driving to this locality, and had only a short distance further to go when, as I was passing a house, the farmer came out and hailed me and asked me why I never hunted the cover just below, telling me that there were lots of snipe (woodcock) there. I had passed by the bit of swamp that he mentioned a score of times, but had never given it thought so far as game was concerned, for a more uninviting-looking spot it would be hard to find. The ground was very low, and it was more than half covered with stagnant pools of greenish-looking water, while rather a sparse growth of pin oak and button-ball bushes completed the picture. Thinking that the man had seen a bird or two there in the summer, I was about to say something of the kind and drive on; but the evident sincerity with which he had spoken influenced me to give it a try, so I got out of the wagon, and hitching my horse I invited him to accompany me. Accepting the invitation with evident pleasure, we were soon at the swamp, and I sent the dog in; but before he had gone toft, he straightened out on point.

I shall never forget the expression that came over the old fellow's countenance when the dog stiffened; his mouth came wide open and his eyes bulged out while he partly crouched down as though he were backing the point. When I put up the woodcock and killed it the old man broke shot, and the manner in which he floundered through the mud and over the bogs beat anything of the kind that I ever saw. In fact, I was so worked up that I never thought to shoot at either of the three others that he flushed in his wild scramble, but just stood there and laughed until I was about used up. The bird was only winged, and gave him quite a lively time, but finally he grabbed it and brought it in, and such a looking man I never saw before; he was covered with mud and green slime from the crown of his hat to the soles of his feet, but the old fellow was happy, and as he handed me the bird he rolled a bit of the swamp mud around in his mouth, and spitting it out exclaimed: "I hain't had so much fun since I fell off the haystack." Of course I was anxious to hear about this performance, and in response to my request for the story he gave me this.

"You see, we had company from York—my wife's brother and his wife and three gals. Sam and his wife were our sort of folks, but the gals were too highfalutin for me. They didn't like country life nor country folk, and took a good deal of pains to show it, dressing up every day in white dresses and ribbon fixin's, until they made me sick; and then the way they held up their skirts and walked tiptoe round the yard, as though the ground wa'n't good enough for them to walk on, or as I told Lucy—that's my wife—just as though they were afraid of stepping on something. After they had been here three or four days I was topping off a stack of hay by the corner of the barn, and as it was getting close on to sundown, Sam went for the cows while I finished the stack. When I had got about through, Dora—that's the oldest gal—came tiptoeing along, and old Suke—that's our old pet muley cow—saw her, and thought that it was Lucy going to give her some salt; so she swished her tail round in a circle and give a bellow and started for her full chisel. Dora saw her and dodged behind the stack, and I leaned over to see the fun, when

my foot slipped and I came down kerwallup within 2ft. of Dora, flat on my back. She thought it was the cow, and land sakes alive! how she did holler and get away from there. She scooted straight for the barnyard, screeching at every jump, and she didn't go tiptoe either, nor hold up her skirts, but just pulled foot the best she knew. I had kinder got straightened up on one knee, and to save my life I couldn't get up any further, so I just stayed there and laughed fit to bust, but the best fun came when she struck the soft spot in the middle of the barnyard; her feet stuck in the mud, but she kept right on and went kerslap into the mud and rolled over and over and stepped on herself and hollered and then rolled over again; and you just ought to have seen that white dress and those pink stockings; they looked as though enough stuff stuck to them to manure twenty hills of corn. I think I must have gone off in a fit or something, for I didn't see the rest of the performance, and when I got up on my feet she and Julia—that's the second gal—were just going into the house. The gals were as mad as wet hens at me, but Sam and Mary—that's his wife—both said that a man that wouldn't laugh at such a scrape had better sell out and quit business."

The style in which he told the tale, and the gestures with which he embellished it, were about as mirth-provoking as the tale itself, to say nothing of his personal appearance as he stood there in his mud- and slime-bedraggled garments; but the old fellow was happy, and appeared to be enjoying himself, if one could judge by the snapping of his eyes and the twitchings about the corners of his mouth. After we had taken time to cool off I again sent on the dog, and in that small patch of uninviting swamp I shot seven woodcock, every one of which the old man gathered; but he did not add much to the mud on his clothes, as there was not room for it.

For several years I shot out this cover a number of times each season, always finding from three to ten birds, and once, in late October, after a heavy frost that froze the ground solid, I brought fourteen to bag. Why the woodcock should visit this place, or stop there after coming, is more than I can tell; but they evidently liked the spot, and had frequented it for many years, as the farmer told me that he had often seen them there when he was a boy. Many times since then have I investigated such places when I have been exploring new grounds, but have never found one since that held birds, although I have often stumbled on very unlikely-looking places where birds were nearly always to be found in proper season.

I once followed a wild old cock grouse well into the depths of a large tract of heavy timber, and as I came to the summit of a knoll where the ground was somewhat depressed and showed evidence that water stood there in a wet time, my dog came to a point, and as I approached him a woodcock rose. At the report of the gun seven others flushed, all of them lying in a spot not more than 15ft. across. After I had gathered them in I took my bearings so that I could find the place again, and a few days later I revisited the spot and found five more. For many years I visited this place a number of times each season, and always found birds there. Now this place was half a mile from open ground, and more than a mile from any other woodcock cover, and I am still wondering how the birds could find the place, as I invariably made a clean sweep of those I found, so that none were left for guides. A friend that often visited the spot with me was strong in the belief that the birds could smell the moist place, for they certainly could not see it, and as I had no better reason to give I was forced to admit that there was at least a probability that this was the true solution of the problem.

One of the most singular places to find woodcock was discovered by me while I was on an expedition for whortleberries. This was no less than a cone-shaped knoll containing about an acre of ground, with its summit some 20ft. above the surrounding ground, and completely covered with whortleberry bushes and rocks, with no tree or other bush upon its entire surface. While picking berries I flushed a woodcock, and soon after another one rose, but I gave the matter little attention, only thinking that this was a queer place for them. A few days later I was again on the knoll, when, greatly to my surprise, I flushed another bird, and as I had become somewhat interested, I made a thorough investigation of the place and put up three more. When the game season opened, some two weeks later, I made an early visit to the knoll for the purpose of finding out if this was a regular resort for them, or, as I believed to be the case, it was only an accidental happening that I had found them. Greatly to my surprise, I found two birds there, and as the place was but a short distance from noted grouse covers I was often in the vicinity, and never failed to find from one to five woodcock on this almost barren knoll, and in the many years that I knew it I have no doubt that I shot in this place more than 200 woodcock. I never visited the spot without speculating upon the reason that should induce the birds to seek such a place to lie in through the day, for there was absolutely nothing, so far as I could see, that should call them there. The ground was dry as an ash heap; there was no shade, while the tangled growth of whortleberry bushes made it almost impossible for them to walk around; in fact, so far as I could see, there was not a single desirable feature that could induce these fastidious lovers of shade and moisture to make of this barren spot a favorite haunt, and the only conclusion that I could arrive at was that I was a poor, weak mortal with not wit enough to fathom the reason that governed the coming and going of a bird that I had heretofore prided myself no little that I was thoroughly acquainted with all its mysterious ways.

I was here with a friend who often shot with me, and as we went to the dog as he was pointing I caught sight of the woodcock some 15ft. away, sitting in an open place, and pointed it out to my companion. While we were looking at it one of the small yellow butterflies so common alighted on a weed within a few inches of the woodcock's head, when with a quick motion that I had not thought the bird capable of making it seized the butterfly with its bill and swallowed it. "There," exclaimed my companion, "the vexed question is settled, and you can now sleep nights; the woodcock come to this forsaken spot for butterflies."

SHAW.

There was a stiff breeze from the eastward, and it rained.

"Good day for ducks," mentioned Peggy, with a sad, sweet smile; "got the weather now, and all we need 's the ducks."

Without disaster we climbed aboard the shoe-box, and Peggy set the sail. It was somewhat larger than a pocket handkerchief, and somewhat smaller than a napkin. But under its pressure the sneak-box bent down to the washboards, and her forefoot discoursed music like unto wash day in a Harlem flat.

"Pretty safe boat, though," said Peggy; "never tip up, either, 'less you don't know to sail it. Guess she'll stand it. Pretty hard blow this, though."

Having thus considerably relieved my feelings, Peggy amused himself by calling vast but imaginary flocks of geese.

"Hong-gee-ee!" clacked Peggy, with a deftness and verisimilitude marvelous to hear.

"Ever hear a broadbill?" asked Peggy, evidently pleased; "so-tut-tt-t, tut-tt-t, tut-tt-t. Here's a black duck—keck-eck, quak-kk-k."

"Splendid, Peggy; can you call a moose, maybe?"

Peggy guessed he couldn't, so the man that had called a moose and was now seeking ducks called moose for Peggy, until Peggy desired to learn whether the man was not feeling well.

"Oh, yes, Peggy; feeling fine; but that's the way the moose call."

"Mebbe," said Peggy, and that was all; so to relieve his feelings Peggy called more geese, and broadbills and black ducks, and the portable bathtub stood down the creek and gallantly breasted the waves that poured occasionally down the duck hunter's spine; wherefore, in the course of time, the sneak-box came to a point, and Peggy put her nose ashore.

"Here she goes," said he, handing out the guns and the lunch and the shells; "we'll shoot from here, I guess."

Peggy guessed wrong, but that comes later on. Having put out his decoys, he stood down the beach, hid the sneak-box under a mud bank, and then we demolished a haystack, seeking materials for a blind.

"Now," said Peggy, snuggling down into the blinds, "come on with your ducks."

Off the point the decoys swished over the seas, light as a feather and so lifelike that even a market hunter would have been deceived. On the outskirts of the cedar fleet two big brant decoys bobbed merrily up and down, and Peggy watched them with much pride.

"Great brant, those," said he; "look more like brant than the genuine article. Ain't much chance for brant, though. They're all on the beach and the flats."

As if in response, we saw far off in the gathering light a dusky blur upon the horizon. It arose like a cloud of smoke and strayed down the wind, dissolving at length into the bay.

"Brant," said Peggy; "drat 'em."

Presently Peggy spied a duck. It was coming for the decoys—a broadbill looking for company. Peggy began to clatter "tut-tt-t!" like one possessed, whereupon the broadbill went elsewhere. Here Peggy said things not necessary for publication, and a large flight of other ducks skimmed by out in the middle of the bay.

The hours passed; the clouds dissolved, and the sun crept up into a mellow sky; also the wind went down, and occasional ducks went by, always out of range.

"A fellow killed a snipe on the meadow yesterday," said Peggy, despondently; "let's see whether there's any more."

We walked four miles over the meadows, and there were no snipe. Then we returned to the decoys, and Peggy pulled them aboard. Standing southward, we came unto a blind, and Peggy ran the box ashore. Ten minutes later Peggy had out the decoys again, and in the absence of other excitement we toyed with innumerable sandwiches, certain chunks of roast fowl and indescribable segments of mysterious prune pie.

We toyed with that pie through six mortal hours, and with vagrant eye roamed the horizon in search of ducks. We saw them, hundreds and hundreds, and also hundreds of yards out upon the water. Then when new ducks failed to excite interest or comment a solitary broadbill wandered in to the beach.

"Sshsh!" whispered Peggy; "here comes a duck!"

The broadbill was swimming. It dived occasionally, and then it saw the decoys. Thrusting back its head, it journeyed up to the decoys.

"Now!" cried Peggy, jumping up.

The broadbill looked alarmed. It began to swim into the distance.

"Shoot!" cried Peggy, "shoot!"

"Never, Peggy! Not at a swimming duck. How could you?"

Bang! The duck had arisen. It was still arising. Bang! It kept on rising like a feathered yeast cake. Bang! bang! said Peggy's gun; but it was just the same to the duck. It circled around the decoys and came back again. Bang! bang! went the guns, and the duck sat down upon the water. Here it took to diving frantically, with Peggy shooting every time it dived. Peggy got tired of this after awhile, and so did the duck.

So we gathered up the shells and the remnants of the prune pie, and returned to the sneak-box. Hoisting sail, we stood back to Forked River, and a large and aromatic supper.

"Drat that duck!" said Peggy.

If you desire ducks, go down to Forked River. Go early and stay late. Don't take a gun. Take a field glass and a telescope. If the ducks are out of range of the field glass use the telescope; it will keep you busy. There are more ducks that have never been shot in Barnegat Bay than in any other part of New Jersey. And if you desire to shoot, invite the lawyer who told me about them. No Jersey jury would convict you of manslaughter, and in all probability a large and suffering community will rise up and honor you, speaking in the name of the public and worshipful to a degree.

That's all.

A Paper for the Home.

A SALEM, O., subscriber writes: "THE FOREST AND STREAM is a paper which I always look forward to; and while my wife is not so enthusiastic a sportsman as myself she enjoys it too. It is clean and fit for any gentleman's table."

CHICAGO AND THE WEST.

Items on Spring Shooting.

CHICAGO, March 24.—A sportsman of Cleveland, O., writes to a friend of FOREST AND STREAM some little notes on the spring shooting in his neighborhood, which the latter is kind enough to put in the possession of FOREST AND STREAM. The gentleman writes:

"We have received word from the keepers of both the upper and lower houses on the Ottawa grounds that there are thousands of geese on the marshes—more than have been seen there before in twenty years—and that the open waters are crowded with canvasbacks and some redheads. The last-named duck is getting very scarce in this country. They report the marsh ducks in immense flocks.

"I don't believe in shooting ducks in the spring, and there is very little of it done on our marshes. Sometimes we go up in the spring and shoot a few ducks, but discourage large bags. I met a member of one of the Lake Erie clubs to-day, and he said one of their members had just returned with 140 ducks. I can't see how a man can do that in the spring. Just imagine what his bag means, if you could see those ducks coming down next fall with their progeny. About 1,000 ducks, that's what this bag means.

"The ducks have not been shot at much on the Ohio marshes during the past two years, as two years ago the marshes were dry, and last year they were pretty much grown up, so that the hunters could not get at the ducks. The result of this rest which the ducks had is seen in multitudes of ducks on our marshes this year."

There has been a second and greater flight at Lake Senachwine. A great many shooters have been at the Undercliff, and a great many birds have been killed. One shooting party is reported to have killed 700 ducks. A number of Peoria shooters are there. Yesterday I heard of one bag of eighty-five mallards killed by one gun on Lake Senachwine one day this week.

The full flight has reached the marshes of middle Wisconsin. Along the Wolf River and the Winneconne marshes bluebills and redheads have showed up in great numbers during the past week. There is no doubt that there will be heavy shooting on the deep-water ducks, and also that great numbers of marsh ducks will be illegally killed. To show the growing sentiment of even disinterested parties against the shooting of wildfowl in the spring, I should like to offer the following quotation from the Oshkosh Northwestern:

"Within a week after the shooting begins the birds will be so wary that it will be next to impossible to get a shot at one of them. While a great many take pleasure in shooting ducks in the spring, there are sportsmen who will not, as they consider spring shooting a species of slaughter. The ducks seen on these waters in the spring are on their way north. They drop down for a brief rest on their semi-annual voyage. They are as a rule too lean to be of value as an article of food, and the flesh is not very palatable, because of a fishy taste. When they leave their southern feeding grounds they are fat, but on their way north they lose flesh. Their food en route consists largely of small fish and a few snails, and the flesh becomes tainted. Sportsmen who do not hunt in the spring claim that the slaughter of ducks on their way to the nesting grounds is most destructive, as the death of one female duck now means the loss of a whole brood for fall shooting. Spring ducks as a rule keep to open water, and are easily decoyed. During the past two or three nights the musical sound of wild geese on their way to the northern nesting grounds has been heard, a sure sign that spring is not very many weeks away."

Still another Wisconsin paper, not, as it would appear, published solely in the interest of sportsmen (The Fort Atkinson Union) makes the following comment on spring shooting:

"The sportsmen have been having rare sport in duck shooting on the Bark River and Scuppernong marsh. The slaughter has been by the hundreds and running up in and beyond the thousand mark. The shooting of a thousand ducks in the spring decreases the fall supply by five thousand, an argument against spring shooting. Extermination of the flocks will arouse the lawmakers when it is too late."

It is very gratifying to see numbers of those journals which are sometimes described as "country papers" taking advanced ground in matters of sportsmanship. The country papers are the rank and file, the bone and sinew of journalism, and their editorial opinions, usually intelligent and well weighed, carry more influence in proportion to their circulation than those of any of the great daily papers which claim to mould public opinion. The fact that so many local papers nowadays pay attention to game law matters shows that the question of game protection is at last attaining the popular interest it has long deserved. Thus still another journal, the Tribune, of Bay City, Mich., goes on record in favor of the Michigan law which prohibits shooting in the spring:

"Wild ducks are beginning to arrive, and the high water in the marshes makes it certain that a large number will nest and raise their young in this vicinity, which to sportsmen is an encouraging prospect. In this connection local sportsmen say they are prepared to fight any attempt that may be made to induce the Legislature to repeal the present law regarding wildfowl. The former law allowed certain kinds of ducks to be killed in the spring; now all are protected. There are some people who are opposed to this section of the game law, but sportsmen claim that it is a necessity in order that there may be plenty of birds for the last part of the season."

May not Drain the Marsh.

Some time ago the Wisconsin State Land and Improvement Co. undertook to drain Muskego Lake, in Wisconsin, by cutting a canal from it to Wind Lake. August Priewe sued the company, and the case was taken up. A decision was handed down on March 21 by Judge Johnson, giving Priewe \$1,000 damages and declaring the law which authorized the draining of the lake to be null and void. The decision demands that the original level of the lake be restored. This may be considered as giving back to the public that much hunt-

ing and fishing ground. The Court says that the State holds its inland lakes in trust for the benefit of the public, and not as an absolute proprietor, and has no right to give them away for private use.

For Killing Elk.

Joseph Chase and Charles Dando, earlier mentioned as having been arrested for illegally killing elk in the Sun River country, have pleaded guilty and been fined \$250 each, with six months' imprisonment additional. This is the heaviest penalty which I remember to have seen inflicted upon any skin hunter. The men were alleged to have engaged in their elk shipping and elk butchering business on a large scale.

A Big Club.

At the annual meeting of the St. Louis Game and Fish Preserve Association the following officers were elected: George A. Bayle, President; John M. Cates, Vice-President; Wm. D. Boyce, Louis H. Haase, Alfred O. Westermann, Theo. H. Conrad, Wm. T. King, Directors; and George J. Chapman, Secretary and Treasurer. The membership has reached 185 business men. C. C. Maffit, Adolphus Busch, Col. Bob Aull, Dr. A. V. L. Brokaw, James T. Drummond, J. B. C. Lucas, Judge Leo Rassieur, Julius S. Walsh and others are included in the list.

From a Good Town.

Mr. G. F. Simmons, of Peoria, Ill., was in the city yesterday. Mr. Simmons is secretary of the Illinois State Sportsmen's Association, and he lives in a mighty good town. Peoria is without doubt the second shooting city in Illinois, and comparatively speaking is a bigger shooting town than Chicago. It is chock full of trap shooters, duck shooters and all other sorts of shooters. The winter convention of the Illinois Association has stirred up great interest in Peoria and adjacent towns on game protection matters.

Limit the Bag.

Mr. A. H. Scott, of Clinton, Ill., in handing in his dollar to the finance committee of the Illinois State Sportsmen's Association, does so with the following indorsement: "Cut the number of birds allowed to be killed in one day to 25, and that's too many." I wish that every one concerned with sport in Illinois thought just as Mr. Scott does. There are several points in the proposed bill of the Illinois State Sportsmen's Association which do not meet the approval of a great many sportsmen, which indeed are perhaps not approved by the majority of the sportsmen of the State; for instance, the indorsement of spring shooting, which is now being condemned by gradual progress of belief in Western States as a relic of the past, and not in line with the requirements of sportsmanship to-day. Still this bill was devised by the majority of the members of the Illinois State Sportsmen's Association, who took sufficient interest to attend the convention, and as loyal members of that organization we are obliged to support the action of the majority. The prospects of a good sum of money for that purpose are at present very fair.

Loss to Lake Poygan Club.

On last Monday, March 21, the club house of the Lake Poygan Club, one of the best duck shooting clubs of this part of the West, was destroyed by fire. The members lost not only their club house, but a number of their boats, some twenty or thirty boats being consumed. Lake Poygan Club has many members in Chicago, and is a representative shooting body. Its property on Lake Poygan, Wis., is very valuable, and the shooting on its preserves has usually been accounted the finest known on the many club marshes of Wisconsin. There is no doubt that the loss will be quickly remedied, as the membership is a wealthy one.

Snipe.

Jackshipe and plover have appeared in this vicinity, and I now hear of a few very good bags on snipe, mostly to the west of this city. A few birds have been killed along the Indiana marshes, near Davis and Shelby. The birds are very thin and wild, and hardly repay the shooting yet. The weather is growing milder now, and the grass is beginning to show, so that before long the flight will settle and feed, and can be depended upon more than is possible now. Of course one may hear of a bag in a certain place one day, and on the next may find no birds there at all. A few flocks of plover are reported to have been seen early this week near Dixon, Ill., and snipe are coming in over that country. Next week we should hear of golden plover near Gilman, this State.

For those who inquire for snipe ground I would recommend the Fuller's Island country, above Shelby, Ind., and the big marshes east of Swift's Station, on the Grand Trunk Railway. The Kankakee marsh, near Davis, will open early. The Sag, near Chicago, is too much shot to count upon. The big sloughs near Chicago, beyond Arlington Heights, should this coming week yield some toll, and around Fox Lake, Ill., the birds ought to drop in for a time. Duck shooting is about as good now at Fox Lake as it is apt to be this spring. A few good bags have been made on bluebills.

In the Coeur d'Alenes.

The name of the Coeur d'Alenes naturally brings up thoughts of bears with manes on their shoulders, and sheep with ammonite horns, but the notion of the wildness to-day in the Coeur d'Alene country is somewhat reduced by the reflection that they shoot ducks out there now, and not only shoot them, but feed them artificially. The Coeur d'Alene Rod and Gun Club has imported 150 lbs. of wild rice, which will be planted in the Coeur d'Alene Valley lakes, and which it is thought will help the shooting. The planting of wild rice is a very wise thing for any ducking waters, for the wild duck is never better eating than when fed on this grain, and never more abundant than where it can get this food. Wild rice itself, as I have earlier testified in these columns, is mighty good to eat from a human standpoint.

Didn't Know It.

The State of Wisconsin is having a little wrestle with an express company which has been handling game contrary to the law. The express company set up the claim that it didn't know what it was receiving for shipment, and ought not to be penalized for its ignorance. The result would not, according to the laws of evidence, long remain in doubt. The common law hath never, from the time of William Tell and Gessler down, taken compassion upon the man who, having blown down his gun and thereby lost his countenance, hath sought to palliate the fact by the assertion that he didn't know it was loaded. All guns, and all laws, should be regarded as loaded.

Mixed.

We have once or twice tried here in Chicago to safely bed the lion and the lamb by calling conventions of mixed nature, wherein the sportsmen and game dealers met to try to agree upon some course of action which should prove of mutual benefit. These affairs have all, without exception, proved to be of mutual benefit—to the game dealers. The latter were always willing to combine with the sportsmen whenever the sportsmen were willing to allow the dealers to do just as they liked in selling and shipping game. In view of the results here I am disposed to view with considerable distrust the attempt in a similar line which was this week made at St. Louis. It is stated that 100 commission men, game dealers and officers of hunting and gun clubs met at Mathis' Hall. Messrs. P. M. Kiely, of P. M. Kiely Co.; Nat Wetzel, of the Western Game and Poultry Co., and Frank H. Miller, of Trescher & Miller, all heavy game handlers, addressed the meeting, urging united action in the interest not only of the trade, but also of the sport. Mr. Kiely took the chair, and Mr. Dennis acted as secretary.

"The consensus of opinion in the large gathering was that some action should be taken for the forming of a permanent organization, to be empowered later on to approach the coming revision session of the Legislature for needed changes in the State laws. It was decided to form a permanent organization with the following officers: P. M. Kiely, President; Nat Wetzel, Secretary; Fred Hager, First Vice-President; Frank H. Miller, Second Vice-President; Otto Voelker, Treasurer. The chairman then, on motion, appointed a committee on constitution and by-laws, composed of Nat Wetzel, J. B. Retallack, David Unger, H. Landauer and George J. Hageman. It was decided to name the new organization the Commission Merchants and Game Dealers' Association of Missouri.

"Secretary Wetzel was instructed to put himself in communication with the organized bodies throughout the State interested in the protection and preservation of game, both as a commercial commodity and a sport, with the view of securing opinions to aid the new Association in its work.

"The next meeting will be held on Monday, April 4."

There is a contradiction in terms in the above real or pretended eagerness to learn what organized bodies think about the question of game for commercial purposes and for sport. There is no body of modern sportsmen to-day who believe that sport and commerce mix. If the real sportsmen of St. Louis are really interested in this movement, the best thing they can do is to rid themselves of the game dealers; and not be misled by any talk of compromise. It will be the old story. Far better in principle, and even to-day equally effective in practice, is it to come out flat for the FOREST AND STREAM plank, "Stop the Sale of Game." Then the sportsmen need fear no entangling alliances, which have but one end, and which are instituted but for one purpose. Shooting for sport and shooting for the market never did and never can go together. Laws for the dealer and for the sportsman never did and never will go together. Why try the impossible? Stop the "concessions." Block up the loopholes. Come out and fight, and if you get licked, at least do yourself the honor of being licked in good company.

As Others See Us.

The following letter has been received at this office of FOREST AND STREAM:

"Dear Sir: I see by your issue of March 12 that you call W. H. Dupee and myself 'game hogs.' It is a fact that Mr. Dupee, Mr. Frank Turner, of Philadelphia, myself and guide did kill a great many quail in Mexico; we shot three days (four guns), and brought into the Hotel Coronado, 1,052 birds. Our guide, a Mr. Denton, is a market shooter, and is hired by the hotel to furnish game for the table, and he himself will kill anywhere from fifteen to twenty dozen a day. At the time that I was at Coronado there were over 800 people in the hotel. If one puts quail on the bill of fare and serves 800 people with quail, some one has got to kill them. Every bird was shot on the wing except one. I killed that one on the ground; thinking it was a cripple. Three years ago your paper called me a 'game hog' for killing a great many ducks in one day at Swan Lake Club, of which I am a member. Do you happen to know what I did with those birds? You don't, so I'll tell you. I shipped them by express, prepaid, to two different charitable institutions in Chicago. I never sold a bird in my life, and it's only a few days ago that I gave up \$50 as one of ten men to put out quail near Swan Lake Club. We have spent \$500 for quail, and they are put out, and we are going to protect them. I've shot over almost all the Western States, and have never gone on to a farm without first asking if I might. These quail that we shot all belonged to the guide, and what I gave away I had to buy of him. Don't always be in such a terrible hurry to jump on people. I guess if other shooters gave up the coin that Mr. Dupee and myself have to restock the country with quail, they would be running around the streets of Chicago. Now you know what was done with the quail. C. H. LESTER."

If Mr. Lester will refer back to the columns of FOREST AND STREAM, he will find that he is in error in stating that I have previous to this date called him a "game hog." I do call him so now, very cheerfully; but I refrained from it in the earlier publication of the news. I hope he will pardon the oversight. Under the heading "As Others See Us" I printed the comment sent into

this office by a gentleman who had seen the story of the shooting printed in a daily paper. I expressly stated that I refrained from comment of my own. The question, What did they do with them? was not mine, but that of the gentleman who sent the clipping. There is a general belief among sportsmen that butchery such as that chronicled is not sport, but in this case I refrained from comment, in the hope that the criticism of others would make these young men ashamed of themselves, and perhaps teach them something more of the duty of actual sportsmen. Mr. Lester will observe, therefore, that while FOREST AND STREAM has always been in a "terrible hurry" to print the news, and always will be in such hurry, it has by no means been in a hurry to "jump on" the young men who did this extensive shooting. I do not intend to "jump on" them now, for the publication of the facts is alone sufficient. I must say, however, that Mr. Lester's letter conveys no news not already printed in FOREST AND STREAM in regard to the disposition of these birds. Neither does it make the act of shooting these birds one whit better. Mr. Lester seems anxious to put on the white apron, not of the freemasonry of sportsmen, but the white apron of the plain hotel butcher. This is his privilege. As to the fact that he and Mr. Dupee have planted quail, I am very glad to learn of it, and to offer it as news, but not as any extenuation. It is far easier to kill a thousand quail than it is to raise a thousand quail. The question of the relative financial resources of persons who do or do not fancy these inordinate bags, or who are or are not able to spend money in acclimatization of quail, has of course nothing to do with the ethics of the men who would kill a thousand quail for use on hotel tables. It would have been very much better taste and better form to leave it out. Mr. Lester may begin to see by this time how others look at his performance. If under this general verdict of censure he can find enough self-complacency to justify himself, that is his own affair. Sportsmen will reserve their right to look at the matter from a different standpoint, and FOREST AND STREAM will reserve the right to print the news as it happens, nothing extenuate nor ought set down in malice.

What Did They Do With Them?

A gentleman of Kankakee sends me a clipping from a local paper, with the comment that "This is how the ducks are being destroyed." "E. W. Reitz, of the West Side, has returned from a two months' hunting trip in Texas. Mr. Reitz is an enthusiastic hunter, and reports excellent sport. Over 1,300 ducks were killed in one day's hunt on a place about 200yds. square. Mr. Reitz's health was greatly improved by the outing."

E. HOUGH.

1206 BOYCE BUILDING, Chicago, Ill.

The Boston Show.

THE closing week of the show of the New England Sportsmen's Association was even more of a success than the first. The only disagreeable feature to the outsiders, who could come in for only a day or an evening, was the crowd that thronged the Mechanics' Building, increasing nearly every day to the last. The end was Saturday evening, March 26, two weeks from the opening. People who waited till near the close before attempting to gaze upon the wonders that skilled sportsmen had got together came away complaining that they could "see nothing" for the press of other people.

Financially the show was more of a success than even the most sanguine of its promulgators had dared dream of. On Saturday, when the exhibition had been in progress a week, 13,000 tickets were sold. Monday and Tuesday were each great days, but on Wednesday, New Brunswick Day, the climax was reached, when 16,000 tickets were sold. Thursday, Maine Day, paid even better, because not quite as many tickets were free, over 15,000 tickets having been sold. Friday, Quebec Day, was great, and so was Saturday, the closing day.

The lake, with the swimming, canoeing, log-riding, diving, interspersed with feats athletic and farcical, has proved a great attraction. The moose hunt, with the calls on the birch horn, as well as the game bird calls, have proved to be features of which the crowd did not tire. The flocks of wildfowl, nearly 100 in all, have attracted much attention. Wood duck, in their most beautiful plumage, almost unknown before to the host of sightseers, have continued to increase in attraction; while gradually it has dawned upon the ordinary observer, what the sportsman and naturalist have long known, that these beautiful birds are climbers to some extent, and really build their nests in hollow trees. The beautiful little teal; blue and green winged, have proved very attractive as well as the more stately turkey ducks and Canada geese.

The animals have stood the thirteen days of being exhibited well. The only losses have been the caribou, mentioned last week, and the black fox—a rare specimen of great value. The two bull elk have both dropped their antlers since the show opened—a lesson in natural history to many people, that these beautiful creatures, as well as the whole genus *Cervus* annually grow and shed a set of antlers. Tom, the little moose, is as tame as a kitten, and he really is looking sleek, with an expression of gladness in his eyes that he has fallen into so kind hands as those of Leon A. Orcutt, his captor, and who has had charge of him since the show began. There is some question about his going to Portland after all. His captors would like very much to present him to the New England Association, and permission has been asked of the Governor of Maine to do that, and his decision is awaited.

New Brunswick and her sportsmen and guides, with their cozy cabin and beautiful exhibits, have added much to the attraction of the show. New Brunswick Day, noted above, was one of the most successful of all. Much has been accomplished in the way of acquaintance and kindly feeling with our brother sportsmen across the border.

Maine Day was all of the success that might have been anticipated. The Maine guides and exhibitors were at the best—resplendent with blue ribbon badges. They go home greatly pleased with Boston and the show. One of the pleasant features has been their meetings

with sportsmen they have guided, with planning for next year.

Quebec had her innings Friday. Mr. L. Z. Joncas, Superintendent of the Department of Fisheries and Game, Crownlands Division, Quebec, headed the party. He was accompanied by Editor Chambers, of the Quebec Chronicle; J. H. Beemer, R. E. Follet and H. P. Neill. Representative Hugo A. Dubuque, of Fall River; Dr. J. L. Charlefoix, of Montreal, and Dr. Louis P. de Grandpre, of Montreal, joined the party at the Union Station, together with Dr. Heber Bishop, of the Sportsmen's Association. The Governor was visited at the State House, guided by John Fottler, Jr., and other members of the executive committee of the Sportsmen's Exhibition. The Governor was pleased to entertain the distinguished visitors at the State House; and tendered them his private box at Keith's. The Quebec incident, as well as the other "days," have been worthy of note, together with the entire show, for that matter, for the amount of true democracy of feeling they have engendered between the different sections they have brought together. Sportsmen and other people have met and have learned more of each other's ways than could have been possible by any other means, and it is not too much to say that national differences are being brought more into harmony through sportsmen by far than through politicians. Go to Canada and Maine, and hunt and fish; then invite Canada, New Brunswick and Maine to sportsmen's exhibitions, and a great brotherhood will have sprung up that intriguing politics cannot sever.

One of the most pleasing features of the exhibition was brought out the closing night on the lake. Dr. Heber Bishop succeeded in landing a 134lb. swimmer with a 14ft. salmon rod, made by Joe Dalzell, of New Brunswick. The weight of the rod was 16oz., valued at \$75, offered by Dalzell to any sportsman who would land the swimmer in ten minutes. The swimmer had previously been thoroughly coached by Dalzell, and adding to this a good water training he fought gloriously. Shooting across the lake the first trial, he succeeded in breaking the line, making the swimmer victorious. Another trial was allowed, with the reel better adjusted. The swimmer drew forth great applause, even such salmon anglers as John Fottler, Jr., D. H. Blanchard and Dick Harding rising to a pitch of enthusiasm. The swirls, the dives and the backward turns were each true to an imitation of the salmon. At last the human fish was landed inside the limit, the pliant rod having been too much for even a man. Joe Dalzell says that if the Doctor had not succeeded, or if the rod had been broken, he should have undertaken the job himself.

It is altogether likely that another sportsmen's exhibition will follow next year, with new and added attractions. In closing, too much credit cannot be accorded to the board of directors, with Harry Dutton as President, Walter L. Hill, Secretary and Treasurer, and Chas. W. Dimick, General Manager.

The baby moose, about nine months old, and only four weeks from the native woods, has become as tame as a colt, and proved a great pet. It is one of the features of the show to see him eat the twigs of the dwarf maple, his natural food in winter. Twigs nearly as large as one's fingers are not too large for him to masticate. A little five-year-old who saw the little moose eating at the show the other day said to his papa the next morning that he did not want the moose at his house: "He'll eat all the kindling wood up."

It cost about \$25,000 to start the show before the doors were opened. To run it to the close the cost was about \$20,000. There were 113 employees, 150 exhibitors, including 100 guides. Everything was ready before the public was admitted, even before the public was admitted, even before the doors were opened to the members and invited guests, on the celebrated first night, when 10,000 invitations were issued. Mr. S. J. Byrne, a thorough newspaper man, had charge of publishing and advertising. Of the souvenir programme, with not a word of advertising, 100,000 copies were given away—not sold. Mr. R. O. Harding, under Mr. Mayard Thayer, had charge of the fisheries exhibit. Mr. Paul Butler, of the canoeing; Mr. F. B. Crowningshield, of the rifle practice. Twenty prominent sportsmen first organized into an association, and were incorporated, and then they worked up an associate membership of \$70, at \$10 each. About 150,000 people visited the show during the two weeks, and everybody was pleased. The show will be repeated next year, beyond a doubt, and the guides have already engaged space, with the promise that they will offer new attractions.

SPECIAL.

Maine and New Brunswick Game.

BOSTON, March 25.—*Editor Forest and Stream:* In your issue of March 19 appeared a communication signed by myself, relating to the misleading statistics published from time to time with reference to the amount of game killed in Maine, and with special reference to the letter of your correspondent, Mr. Hardy, of Brewer, Me. In that communication was contained the following statement:

"Your correspondent might have added that some of the finest moose heads ever taken in New Brunswick are now being shown at the Boston Exposition as part of the Maine exhibit."

It appears that some of the gentlemen connected officially with the New England Sportsmen's Exposition regard this statement as erroneous and also as reflecting upon the management. It was not my intention in any way to reflect upon said management. As to whether the statement was, in effect, erroneous the reader can judge from a simple presentation of the facts, which I am able to verify from having, since the writing of the communication referred to, visited the Exposition.

One of the best heads shown in the Rangeley Lake section of the Maine exhibit (and by some judges considered superior to any moose head in the building) was that of a moose shot in New Brunswick, on the northwest Miramichi, last fall by E. L. White, of Boston. This head was mounted by Mr. S. L. Crosby, of Bangor, and in fairness to that gentleman, who had charge of the Rangeley Lake exhibit, as well as to the management of the Exposition, it should be stated that a card was attached to the head, containing the words:

"Killed in New Brunswick, season 1897, by E. L.

White, of Boston, Mass. Mounted by S. L. Crosby & Co., of Bangor."

There were also shown as part of the Rangeley Lake exhibit three caribou heads, the former possessors of which were killed by the same Mr. White, of Boston, on the northwest Miramichi in the season of 1897.

Mr. Crosby also approached Mr. Knight, Chief Game Commissioner in charge of the New Brunswick exhibit, and offered to place not only Mr. White's moose head, but the three caribou heads as well, in the New Brunswick exhibit, but this offer was declined by Mr. Knight on the ground, I believe, of lack of room.

When the Exposition was opened on March 14 there was shown as part of the Bangor and Aroostook exhibit, and without any label attached to it, the head of a moose shot by Dr. Heber Bishop, of Boston, in December last, on the headwaters of the Little Southwest Miramichi, N. B. This head was mounted by M. Abbott Frazer, of Boston. It was subsequently removed from the Bangor and Aroostook section to a part of the building contiguous to the New Brunswick exhibit.

These are the facts. I abstain from all comment, as I have no desire to enter into a newspaper controversy.

FRANK H. RISTEEN.

BOSTON, March 26.—*Editor Forest and Stream:* I note in your issue of March 19 an article signed by Mr. Frank H. Risteen, of Fredericton, N. B., under the heading "Maine and New Brunswick Game," in which he states that "some of the finest moose heads ever taken in New Brunswick are now being shown at the Boston Exposition as part of the Maine exhibit."

This statement is erroneous, and I wish to correct it. In the entire State of Maine exhibit, which is under my supervision, there is but one mounted moose head from New Brunswick, which is exhibited by Mr. Marble, of the Rangeley Lakes Hotel Co., who employed Mr. Sumner L. Crosby, of Bangor, the well-known taxidermist, to make his exhibit. The head was mounted by Mr. Crosby, and upon a large card suspended from the head is printed the words, "Killed in New Brunswick."

In justice to the State of Maine exhibit, I think it quite proper to make this correction, and at the same time intimate that this head, exhibited and tagged as it is in the Maine exhibit, is a compliment to New Brunswick.

I understand that Mr. Crosby had three caribou heads of his own that were shot in New Brunswick, with which he decorated Marble's exhibit in the Rangeley section of the State of Maine exhibit. Before doing so he asked Mr. Knight, in charge of the New Brunswick exhibit, if he would not like to have them hung in the New Brunswick exhibit; but Mr. Carnall, the St. John taxidermist, objected to Mr. Crosby's work, and Mr. Crosby said he was treated so ungraciously when he offered these heads that he thought he would not press them any further to use them. They were used subsequently to decorate Camp Rangeley.

HEBER BISHOP,

Mgr. State of Maine Exhibit, N. E. Sportsmen's Ass'n.

California Game.

REDLANDS, Cal., March 13.—We had a very dry winter, and duck and snipe shooting has been poor as a consequence.

Messrs. Haight and Keifharber recently visited Elsinore, where they found ducks plentiful, but very wild, owing to an incessant bombardment from the market hunters' guns. Other parties visited the same place with about the same success, only a short time previous to the closing of the duck season. The valley quail are very plentiful, and the scribe has enjoyed several very successful hunts in which they have played no mean part.

Next in order to the valley quail comes the rabbit shooting. They abound by thousands, and he is no sorry shot who can bowl one over as it darts frantically from one bunch of sage brush to another. The footing is very rough here, much more so than the writer has been used to. One needs snag-proof boots on account of the many spines and prickles he has to encounter. Nearly everything here has thorns on it, the real estate men most of all.

We are about thirty-five miles by road from the Bear Valley reservoir, but I am informed that the shooting and fishing privileges have been let, possibly to the club at Riverside.

We have a very lively gun club here of about thirty-five members, among whom are some very superior shots, as W. T. Gillis and others. We are booked for a five-men team shoot with Los Angeles soon, and as there is some warm stuff down that way, some of our boys are looking a trifle blue about the matter.

The season on mountain trout opens soon, and P. T. Sullivan and the writer contemplate an outing with them. Will take a kodak along and send FOREST AND STREAM a print of the result.

REELFOOT.

The Fight for Repeal of 249.

From the Rochester Herald of March 29.

ALBANY, March 24.—Charles H. Babcock has lifted himself into the front rank of State leaders this week by the big fight he has made against tremendous odds. He has routed the allied forces of the lobby, turned down that political-legal combination known as the firm of Tracy, Boardman & Platt, and defied the orders of Thomas C. Platt himself, sent direct from Washington via Charles Hackett.

The fight has been a hot one all this week, and twice the opposition thought it had Babcock's bill beaten. But the Rochester man rallied his friends in the Senate and kept pegging away until he got enough votes to carry the measure. Not until late this afternoon did the combination quit and concede a clear field. The bill was not reached to-night, but it was near the top of the calendar when the Senate adjourned, and it will get through to-morrow.

Assemblyman Weeks was sponsor for the bill, and there was no trouble in sliding it through the Assembly, where its presence did not seem to be discovered. When it reached the Senate those opposed to the repeal awoke, and the fight started. The firm of Tracy, Boardman & Platt was retained and Senator Platt was enlisted. The

latter sent peremptory orders from Washington to kill the bill.

Almost before Babcock knew it the bill was ordered back to the committee, and the chairman, Senator Higbie, remarked smilingly that he guessed the bill wouldn't be reported out again before the 4th of July. But it was. Babcock took off his coat and sailed in, with the result that he got a majority of one in the committee and had the bill reported out yesterday over the head of the chairman.

This was the signal for the renewal of the battle. Hackett was sent to Albany to take charge of the fight in person, and the Senators were bombarded by telegraphic orders and long-distance telephone messages.

George W. Aldridge took off his coat and came upstairs to help out his Rochester friend. Together they canvassed the Senate and fought the opposition to a standstill. Men who laughed yesterday at the way that Babcock's bill had been so unexpectedly killed were this morning out in their fighting clothes to help the Commissioner.

Noses were counted, and it was found this morning that the bill was safe, and that the political-legal lobby was beaten. Not until late in the afternoon, however, did Hackett own up and turn tail. He consulted long over the phone, and finally there came the reluctant orders to quit, that further opposition seemed useless and might be dangerous. The bill will, therefore, go through the Senate in the morning as stated, and Babcock will take it to the Governor to-morrow with flying colors.

It was a gallant fight, and Babcock is the recipient to-night of all sorts of congratulations. The old-timers are still holding their breaths at the temerity of the thing.

Sportsman's Protective Association of Western Massachusetts.

SPRINGFIELD, Mass., March 28.—There was an enthusiastic meeting of the sportsmen of Springfield and vicinity this evening at the Board of Trade rooms in this city, for the purpose of forming a game protective association, to include all that this implies. It was voted that the association be known as the Sportsmen's Game Protective Association of Western Massachusetts. Permanent organization was effected by the election of officers as follows: President, Mr. W. W. Colburn, Springfield; Vice-President, Mr. Aaron Bagg, Jr., West Springfield; Secretary, Mr. C. S. Robeson, Springfield; Executive Committee, Mr. W. W. Colburn, Mr. Robert O. Morris, Dr. J. J. Herrick, Mr. Wm. M. Williams, and Mr. H. C. Puffer. The secretary was instructed to call an early meeting for the purpose of laying out the work and perfecting plans for a vigorous campaign against violators of the game laws in the western portion of this State.

SHADOW.

The Wyoming Elk.

ELK P. O., Wyo., March 5.—*Editor Forest and Stream:* Perhaps it may interest the readers of FOREST AND STREAM that have their eye on this game section to learn that up to the present time we have had a very mild winter and light snowfall. The elk are sleek and fat, and some have not yet gone south to their usual winter range. We saw three moose at close quarters a couple of days ago, and they were in fine condition. This, I take it, means a small loss in calves and old bulls for the coming spring, and if I am right in believing that when game winters well and keeps in good condition, the antlers will be large and more developed the next fall. The past winter was a severe one, and it was hard to find a bull elk with large, well-developed antlers. Am I right in thinking the severe weather and conditions of elk regulate the growth of their antlers? Should like to hear from other observers on this question.

BURTON HARRIS.

Punish the Manslaughter

SHEBOYGAN, Wis.—*Editor Forest and Stream:* In FOREST AND STREAM, Feb. 5, Awahsoose is shooting pretty close, but has not quite cut the center. What we need is to have our State Legislatures pass laws, with a State's prison offense of not less than from three to five years, for the shooting of a man in the woods by mistaking him for a deer or any other animal. A few convictions under such a law, duly heralded by the papers, would do much toward lessening such criminal carelessness, and make it safer for a man to go into the woods for deer. With the penitentiary staring a man in the face by reason of law drawn explicitly to cover such cases he will be mighty careful to make sure it is not a man before pulling trigger.

C.

The Cross Bow.

NEW YORK, March 24.—Referring to your editorial of March 16 in regard to "bow-guns," can you inform me where I can obtain a serviceable bow-gun? If not, can you furnish me with directions for making one? Perhaps some one of your readers can supply this. I have been a reader of your paper for five years, and for your remarks on the bow-guns versus modern rifles please accept my hearty thanks.

G. H. H.

[There are, we believe, specimens of such arms in the Metropolitan Museum of Art, which might serve for models or suggestions for nineteenth century sporting weapons.]

New York Sportsmen's of 1899.

NEW YORK, March 22.—*Editor Forest and Stream:* We beg to advise you that at a meeting of the National Sportsmen's Association it was decided that the next Sportsmen's Show shall be held at the Madison Square Garden, March 2 to March 11, both inclusive, 1899, and it shall be our endeavor to make this a strictly sportsmen's show, eliminating anything that does not belong in this line.

J. A. H. DRESSER, Sec'y-Treas.

The FOREST AND STREAM is put to press each week on Tuesday. Correspondence intended for publication should reach us at the latest by Monday, and as much earlier as practicable.

Sea and River Fishing.

Trouting in the Black Forest.

BY FRED MATHER.

(Concluded.)

THE river Alb is a grand stream for trout, but a miserable old poacher was there using nets, set lines and perhaps poisons, for all we knew, to supply the hotel and other markets. He fished openly, and Capt. Malcolm, of Her Britannic Majesty's Navy, Retired, regained his long disused native tongue when he saw his methods, and vented his opinions thereon, both to the man, the landlord and to me. When he warmed up to the subject and got fairly hot under his collar his choler rose and fairly stood on end. The German language contains no good, strong swear words, for when a German is mad away down into his solar plexus the very utmost that he can say is "Donnerwetter," which literally translated means "thunder weather." The occasion demanded stronger language, and the British sailor brought it forth from his locker, where it had remained quiescent for years, and interspersed his German with it so vigorously that all understood it. My genial, gentle friend proved to be a perfect arsenal of wrath, and that old poacher did not show up while we were there.

And "this reminds me." On my return trip I fell in with an officer of the German Coast Survey, who had no trace of foreign accent when he spoke English. Said he: "There is one thing I admire the English language for, and that is for its vigorous cursing. There is not a language on the face of the earth in which a man can give such vent to his feelings when he is angry in earnest as in English."

"This is new to me," I replied, "but I know no other tongue than English, although I've studied German and Spanish, but I can readily understand that books would not educate a man in the line of which you speak."

"French is the language of diplomacy," said my companion; "German is the language of science, but English is the tongue for business and for cursing. Why, in your language you can wither a man's eyeballs, trace his lineage to all sorts of things and consign him and his progeny to everlasting perdition. All that is impossible in any other spoken language, and I love the English because it enables me to let off steam when I am boiling over."

Then I knew why an old British "sea dog" interspersed his German denunciations of a poacher with some English terms for which there seems to be no German equivalent. What he may have said in German I do not know, but his English expletives I think I understood. The old poacher was probably warned by the landlord not to be seen while we were there or he might find his occupation gone, for the Captain threatened legal proceedings.

"If the landlord were wise," remarked the Captain, as we enjoyed the cool evening air, "he would banish that poacher and protect the river for angling tourists from America or England, who would gladly pay for the fishing; but he gets trout at a low price from the old fellow and falsely imagines that the trade is profitable. There is no use to complain to the Bürgermeister of St. Blasien, for he knows all about it, and may be a partner of the old man. You note how particularly our catch is measured if one nears the 7in. limit; the officials are particular about that, and would fine an angler who took a trout a trifle under that measurement. It makes me so mad that a cigar doesn't taste good." Some months afterward Capt. Malcolm wrote me that he had learned that the law allowed net fishing under certain conditions of ownership which prevailed then at St. Blasien. The legal size for trout was 15 centimeters from the eye to beginning of the tail fin, or 5¾in.

From the Bürgermeister we obtained a ticket for half a mark—about 12 cents—which permitted us to fish, as we thought from its wording; but we had to arrange with a fisherman, who demanded ten marks for the privilege of fishing in his water. Here the honest indignation of the Briton again broke loose and he showed his permit from the Bürgermeister, but in vain—that permit was a general one, etc., and under protest the fee was paid. "I've not been here in ten years," said the Captain, "and these are new swindles, invented since my last visit; they are petty ones, but as detestable as if they were greater, and I believe in kicking with both feet on all swindles, great or small."

The bridge over the Alb at the hotel divided the fishing into what was called the upper and lower water, and a special permit was demanded for each. We chose the upper because the Captain was familiar with it and believed it to be the best because the lower portion was weedy and in parts inaccessible. There had been some good rains and we were fortunate in getting there before the river had got low.

The fisherman who controlled the upper water was not the old poacher, who for some occult reason did as he pleased in snaring and netting trout when out of range of the heavily charged, rapid fire vocal guns of Capt. Geo. John Malcolm, of Her Britannic Majesty's Navy, Retired. I have heard vivid descriptions from eye and ear witnesses of the bellowing of the mortars when Farragut's fleet passed Forts Jackson and St. Philip, and steamed up to New Orleans; of how fishes with bursted air bladders were afterward washed ashore, and men's ear drums were bursted, and I've heard the indignant wrath of Capt. Malcolm descend in an amalgamated mass of German and English that would have paralyzed a stenographer or wrecked a type-writing machine, and his every word would be fully understood by any listener who might know only one of the tongues he used.

I came to know him thoroughly in two days after we reached St. Blasien. He had thrown off the mask, which all men of the world wear, and which is worn by knaves as well, and stood out in the strong, rugged character that he was. He was far past the age when men kick up a row for the pleasure there may be in a row, and was a quiet gentleman, who was content to live peacefully, but this trip brought out traits in his character that would never have appeared if I had dwelt with him a

year in the quiet of his own home, where he seemed to have passed into the fifth of Shakespeare's seven ages. I would never have considered Capt. Malcolm as a man to command a fighting ship, for he was so suave, so quiet and attentive to matters of form, but when I saw him roused to fury by what he considered an imposition—that was another side to his character, and every man has just such sides. You never know a man thoroughly unless you have seen him under circumstances where his character is developed in time of danger, and then you may be surprised by some quiet fellow who develops qualities which you never mistrusted him of possessing. After I heard him bestow the butt end of a navy blessing on the old poacher, the fisherman, the Bürgermeister and the landlord, I could then imagine him on the quarter deck of a ship of the line and fighting her to her limit.

The old fisherman who leased the upper water to us was a character that I would like to sketch at length if my knowledge of his language would permit. He was tall and rawboned, and wore a sort of military cap with a high front, sloping back, and a straight visor, of that peculiar green color only seen in caps of Swiss or German make, while the rest of his costume was a woolen shirt, well patched trousers and heavy shoes slashed to let the water out as he waded. His rod was of ash, and at least 20ft. long, some 6ft. of line tied to the end of it, 4ft. of twisted gut and a fly big enough for a salmon. I looked the fly over carefully, but it was like nothing on earth, nor in the waters beneath, and therefore might have been worshipped, and yet we did not fall down. I was dependent on my friend for tackle, and had a 12ft. greenheart rod, while his was of the same wood and 15ft. long. He gave me my choice, and as I had never handled a rod as long as his shortest I chose the latter. In those days, and to-day, some trout fishers in England prefer such long rods under the impression that they will cast a fly further, but shorter rods are coming into favor.

I started in with a red-bib as a leader, and a yellow fly as a dropper, a combination fairly good to begin with on strange waters, and soon hooked and creeled a fair trout.

If "basketed" and "boated" are good words to express the receptacles in which trout repose after being caught why is not "creeled" better than "landed" when the fish never strikes land, nor gets nearer to it than to be scooped into what is called a "landing net?" The latter name is more euphonious than would be "creeling net" or "boating net;" I dislike "basketed" or "brought to basket," because I dislike to hear a creel called a fish basket, just as I dislike to hear a fine rod called a "pole."

The Captain was on the other side of the river, and was fighting a fish now and then, but the fisherman was close behind me watching my every motion. He was evidently surprised that I could cast further than he when his rod was fully 8ft. longer than mine. He had evidently chosen my side because I had the short rod, and that any man could cast better or take more trout than he was a new proposition to him. When he got a rise he jerked, and if the trout swung out over his head he had him, but the trout did not always meet his expectations, because of his jaw was torn out before his body felt the impetus, only the jaw responded to the yank, and even that portion of the trout's anatomy did not always reach the fisherman.

The River Alb is a difficult one to fish where we fished it. In places one can wade and have a fair field; in others he meets submerged bushes, if the river at St. Blasien is full enough to be fished, and these necessitate a long detour, and so one skips much of the stream in wading, and there were no boats to be had.

A bunch of willows brought me to a halt, and while reeling up for flanking them the fisherman ran in on me, and I saw his rig; he had a worm as big as a lead pencil and a shot on his fly hook, and then I got red hot and pulled a knife and cut off his "fly" and called to Capt. Malcolm to come over. The river was too deep to wade, and he had to go about half a mile down, where we met him at the bridge. The man was expostulating and gesticulating in a way that seemed to threaten my present and future existence, but as I did not understand a word of it the danger did not seem imminent, and I ask you to believe that I survived.

Capt. Malcolm looked over the arrangement—the combination of fly, shot and worm—and from his extra vigorous remarks a bystander would infer that he held decided opinions on such an aggregation. The man demanded his "fly" and the Captain tossed it into the river and then looked the man squarely in the eye without verbal answer, but any person at all familiar with the varied expressions of the human face could read in his eye: "There's your fly in the river, and now what do you propose to do about it?" The man was angry also, and returned the defiant gaze for an instant, thought better of it and moved off without another word.

After watching the retreating figure until the willows hid it, my friend turned to me and said: "It was stipulated that we should restrict our fishing to the fly, a thing that we were only prepared to use, and only wished to use, and we understood that no other kind of fishing was allowed here, and yet the man who sold us permits to fish uses what he calls a fly. When I saw his rig I was sure that he was not a fly-fisher; didn't it look so to you?"

"I knew that if he was an expert fly-fisher I had much to learn, for I never saw one of the craft tie a 6ft. line to the end of a 20ft. pole and cast a fly for trout, but you must remember that I am a stranger in a strange land, fishing for a strange trout, and I keep my eyes open, observe methods and think. I see things in a foreign land that may seem queer, but hope that I am too much of a man of the world to express surprise or ridicule. If while trouting on an American stream such an outfit bobbed up in the hands of a rustic I might remark on it, but not in this place, as your guest."

"That's all very well, but I mistrusted the fellow, and intended to catch him with bait and sinker, but you caught him first. I wonder now how you dared to cut his line; he is a big, powerful fellow."

"Captain," said I, "he is big and powerful and could probably handle us both if it came to a physical contest, but I did not stop to consider that. I was mad, and when in that condition I weigh a ton; but you rose to

the sublimity of anger when you tossed his hook into the river. At that time you weighed at least two tons, and your face was a bulletin board, for your thought."

"Come now, what did I think?"

"You did your thinking in your native tongue, and it flashed out of your eyes as from a semaphore, from which I read, 'You great big hulking scoundrel'—then a few untranslatable words—I've a good mind to throw you in the river after your con-dem-dem-nable fly.' The man speaks no English, but he understood you, as I did, and he moved off and left the British navy in possession of the river. It was grand and I enjoyed it. I always enjoy a man when he is righteously angry, and my anger wholly subsided when yours blazed up. Shall we go in with our fish?"

We went, and turned in to the landlord, subject to our order, twenty-one trout that weighed about 12lbs. Two stages had arrived, and as we looked over the register the Captain found that a London friend, a Mr. Colborn, had arrived, and as I mechanically ran down the list I read "Erastus Corning, Jr., New York." I knew that young Corning, of Albany, was studying, or pretending to study, in Berlin, and had seen him there, but as St. Blasien was not Berlin I introduced myself.

"Certainly," said Tip—his nickname—"I remember meeting you on a Vermont stream when fishing with Bishop Doane, of Albany, and telling you that the Bishop would never make an angler because he could not bite a worm in two." An evening at whist, Colborn and Corning were winners, and then for the fishing. The morning opened with a drizzling rain, and after breakfast Capt. Malcolm brought forth two rubber coats which would reach below the tops of our waders. Our friends were similarly equipped, and away we went. Our permits included guests, and after what had passed there was no inclination to squeeze the contract too hard. On the upper water that day the rain came down in fine and in great drops, in mists and in showers, but we fished. At noon we assembled under the bridge for luncheon and a smoke with the general swapping of fish yarns, which anglers invent and relate while the fish are resting, and perhaps are doing the same thing, and then we deployed and went up stream to fish down; we all agreed on this.

There are fly-fishers, good men and true, who believe in casting the fly up stream. Bless them! They are brothers of the angle, and if they find sport in having a fly drift down on them instead of drifting it down on a trout let them do it. It was a good trouting day, and we all made good creels. We had agreed to let Colborn and Corning start first, one on each side of the river, and Malcolm and I to follow half an hour later. In my experience the second, or even the third or fourth man has as good chances as the first, on a fairly stocked stream. The first one does not get a rise from one-tenth of the trout that are rising, and within half an hour the trout have forgotten the disturbance he made and some are ready for the next angler.

It is a curious fact that most fish bite well, if not better, when it rains; not only those fish which rise to the fly when the ruffled surface of the water hides the fall of the line, leader and fly, but bottom feeders, like catfish and others, do the same. The fact, for it is a fact, is well known to every schoolboy angler, but seems to have escaped the searching gaze of science. Perhaps more insects fall into the water then and more angle worms are drowned out of their burrows and get into the streams. If that is not the true solution I can't guess any more.

One may not get wet in rain when clothed as we were, but there is a feeling of dampness and of chilliness after half a day of it, for a little rain is apt to get in at a man's neck and in at the sleeve of his casting arm, no matter how he ties his cuff or tries to protect it. Even when an arm hangs by the side water will creep up the cuff of a waterproof. A good fire will dispel dampness, but that creepy, chilly feeling can best be banished by internal applications. As soon as we arrived at the Hotel et Pension we shed our waterproofs and banished dampness and chills.

Capt. Malcolm was enthusiastic as the contents of the creels were displayed, and danced about in glee. "One of the happiest days of my life. I've had such days in other lands, but never expected to have one in Germany; here are nearly seventy fine trout taken in a legitimate manner in less than a day by a quartette of anglers—two from America and two from England. It's grand! Why any one of us can take more trout than that old poacher right on his own water and let him use all the abominable devices that he knows. You two gentlemen should have been here yesterday when my little American friend cut the hook from the line of the fisherman and kept it to show to me. The big fellow never made an attempt to recover it; I think he saw a danger signal and—"

"Nothing of the sort, gentlemen," I broke in with, "the man did not know my language, nor I his, so talk would have been wasted; he waited for Capt. Malcolm to come around by the bridge and right his wrong because he could talk to him, but the Captain fell short of his expectations, for he threw his fly, worm and sinker out into the river, and talked as I've heard mule-drivers talk when the pontoon trains were stuck in the mud, not the same words of course, but with the same earnestness and emphasis. Not I, but the Captain drove the man from the river, and we have not seen him since."

"That fine lot of trout," said the Captain, "would make the old fisherman groan with agony. He would mentally figure up the avoidupois and groan again as he translated the weight into marks and pennings at market rates. I really think that if Mather and I were bigger men or the poacher had not been so big some one would have got a good ducking in the river Alb yesterday. But dinner is ready, and I have bespoken a private table for four, where we may toast the health of all honest anglers and invoke confusion to all poachers."

Capt. Malcolm was at his best that evening, he went over the incidents of the day as if it was the night after a naval engagement and he was recounting the maneuvers of hostile fleets. Said he: "Just as I lost a trout that had become entangled in some submerged willows and took part of my casting line with him, and was repairing damages, I heard Mather's reel sing and stopped to watch him. He had a fine trout that fought hard for

every inch of line, but was humored, carefully played and reeled in when possible, but although gently handled for some ten minutes, more or less, the fish broke away at the supreme moment when the landing net was partly underneath it—a case of light hooking, because I could see by the continued casting that the fly was not lost."

"A similar thing happened to me," said Mr. Corning, "I had a trout in the landing net and had lifted it out of the water, when it slipped through a couple of broken meshes and tore the hook out of its jaw and left without an adieu. Mr. Colborn lost a good one that fairly unhooked itself in the net and flopped out over the rim. Colborn, after you ring for the keller we will listen to your explanation of this bit of remissness on your part, and unless you can show extenuating circumstances it may be necessary for you to ring again."

In the morning our party of the former day broke up. Corning and Colborn going off into the unknown somewhere, while I did not need much urging to go around by Albbuck, Schaffhausen, Rhinefelden and Basel, with fishing here and there. If you are not wearied with this partial account of the trip some time, not this load of poles, nor this summer, I may feel like inflicting the rest of the trip on you, when I think you can stand it.

But I am impelled to say that Capt. Malcolm and I corresponded for some years about the few pounds of trout we took together and got lots of fun out of it, no matter if the postal revenues of both countries were increased away beyond the market value of all the fish we caught. We were not interested in postal revenues, not a little bit, what we cared for was fly-fishing for trout. And we wrote about it. Then came long intervals between letters and finally silence.

A letter from Mr. Schuster's son said: "In reply to your letter of July 27, 1894, to my father I will say: My father died Feb. 23, 1891, of heart disease, aged sixty-eight. Capt. George John Malcolm, of the British Navy, went to Spain for his health and died in Sevilla, Jan. 17, 1884."

And I had been trying to get a letter to this most charming gentleman and angler for more than a year after he had left Germany. If he is conscious now I hope he may know what I have said of him and how I appreciated his bluff, honest character as well as his hospitality to myself, a stranger in a strange land. He tried to make it appear that the obligation was entirely on his side and that my company offset all the expenses of a trip which was as enjoyable to me as to him; but I have a notion that the party of the second part was under such a Chimborazo of obligations that he could not crawl out if he would.

Fishing Up and Down the Potomac.

Wide Water.

NEARLY fifty miles down the Potomac on the Virginia side, just before reaching Acquia Creek, the historic, is the little station of Wide Water. A post-office, with money-order facilities, an express office and a store all run, at first sight, for the convenience of the one citizen in evidence; but the community grows on the stranger; more houses, and prosperous, lie scattered about, a good deal of business centers here, and mail is put on and off for two or three mail routes into the back country.

The present merchant, postmaster, etc., lives in the house on the hill, an old shooting lodge that belonged to Fitzhugh Lee, and our host and his good wife make it so pleasant for us we are tempted each visit to make it the last and stay; no doubt the same temptation beset those who were fortunate enough to enjoy the friendship and hospitality of its former owner.

The eldest of three little ones, who assist in our welcome, gravely informs us at once, by way of introducing himself, that he is a "crackjack," and subsequent developments confirm us in the opinion that he deserves the title. The house by now seems sadly in need of renovation as you walk up the steep path to its wide porches, but when you stop on the threshold and turn around you have no thought for anything save what lies before you—the finest view on the Potomac—and there are many attractive scenes on this beautiful river.

It is a sea. Directly opposite on the Maryland side lies Liverpool Point, and the swampy inlet of Mallows Creek, but one distinguishes nothing but the dark outline of the further shore, miles away. To the south lies Clifton Beach, but it is the miles of water between that has given this place its appropriate name.

Here one of the longest seines on the Potomac is operated, but the picturesque hauling must wait for another time.

At the foot of the hill, within a stone's throw of the house, Meadow Branch makes into the river, and just before reaching it surrounds a tiny island on which are the ruins of an ornamental summer house and bridge, where it is said refreshments were once dispensed to the thirsty. The county is dry now, and one must go some miles to find anything better to drink than is furnished by the numerous fine springs in the neighborhood.

Meadow Branch is not a large stream, though making some pretensions in a freshet, but it has brought down sand enough in its long life to shallow the bay at its mouth and build shelving beds of sand far out in the river, where we stood one summer midnight at low tide and watched the hauling of a seine.

A few yellow perch and sunfish venture over the shoals at its mouth to spend their summers in the pools of its lower course, but not many.

Up and down the beach is fair white perch fishing when the water is clear and the tide is right and the sun low; but the strip of grass and moss extends so far out as to be discouraging. In places where use of boats has cleaned a channel through the saragossa, good white perch fishing may be had with bait at nearly any hour. But we came after bass. A mile up the branch, which has a lazy course through marshy meadows, though with high hills on either bank, stands a flour mill. Our host has a couple of Texas ponies at the store door, hitched to a fix, and we get in with some misgivings. They are hitched loosely, or seem loose, they are so small, but of that breed that covers fifty or sixty miles in a day, and then climb a tree for diversion

if a scrap of paper blows across their path. But we are reassured by their businesslike way of starting off, though for the first hundred yards one thinks he's doing the role of running mate—and we forget the team for the next ten minutes while we enjoy the sandy drive between green fields and through shady lanes.

Only one incident occurs to mar the pleasure of the ride—and the day's sport. A four-leaved clover stands out in a bunch by itself close to the road in such plain view that one might have seen it from a balloon. When my companion's attention is called to it he goes into mild hysterics. He is one of the least superstitious of men, and one of the most sanguine of anglers, and they are a hopeful race—but he has several fixed ideas, and the firmest of these is that a four-leaved clover is nothing more nor less than a "hoodoo" that will spoil the best day's fishing ever invented.

That any one should attach any importance to seeing the moon over either shoulder, or spilling salt, or the thousand incidents that are here and there supposed to affect our future, or presage joy or grief, seems to him but arrant nonsense, but a four-leaved clover—that's different.

The miller stands in his door with smiling welcome, and cheerfully gives us the freedom of the run. We stop to see the old-fashioned overshot wheel driven with water from a short race from the dam a hundred yards away, and then drive on to the bank of the lake.

The dam is built at the point of a V across a ravine, where two streams come together to make Meadow Branch, and the back water makes two arms away from the center of the lake far up their courses. The apron of the dam is 15ft. or more below the running boards, and the deepest water behind it is said to be 20ft.

The lake was stocked some years ago with black bass, part of a consignment intended for some other planting, and these have thrived and multiplied until the lake has plenty, and furnishes first-rate fishing when the water is clear, which was seldom last year—a record year for mud throughout all this country.

Bass of 5lbs. have been taken here, though just above 3½ were the largest ones we have landed. With 50z. rods it is beautiful sport, and we have had nearly as much fun losing some we were sure were much larger.

As Henry Van Dyke, whose sketches are the pearls of angling literature, puts it: "The spectacles of regret always magnify;" and again: "Our best blessings, like our largest fish, always depart before we have time to measure them."

There is an older one: "Blessings brighten as they take their flight." And it is the common experience of anglers, told in all languages, that the fish which gets away is larger than any brought to net.

The hills about the lake are well wooded, and there are a good many squirrels, but they are the little gray squirrel, and nearly as shy and hard to get as the big bass. We gave them a trial one day when the water had gone muddy over night, and the fly was hopeless. We hunted faithfully, and heard and saw squirrels enough, but the trees are large and the woods were strange and the hills steep, and there may have been other reasons, such as lack of skill, which never suggested itself to us; but at any rate we did not seriously thin their ranks, and as we left the edge of the woods, and the shadows were lengthening, we could hear the saucy chatter of a gray jingo who had persistently stayed in his hole while the enemy was in sight. We were not sure of his language, but the tone of triumph and defiance seemed to us to convey the idea he was inciting his comrades to make a sortie and exterminate us.

The only boat on the lake is a scow, nearly as wide as it is long, and the only paddle a board nailed to a sycamore pole. Paddling on one side, as one must, and sitting in the right-hand corner of the stern, the prow of the boat was the angle diagonally opposite, and this crossways course of the heavy box was slow and painful to the motorman.

We never found the depths clear, but our last surface-clear day we had paddled each other an hour apiece, and come in for lunch; and there is no pleasanter time in such a trip than the nooning. Drip coffee, without which our day would be incomplete, and a pitcher of cold milk which the miller's kind wife had sent down to us had washed down the rather elaborate lunch we are fond of taking when it is convenient. A stretch on the grass under a great oak, watching the clouds even as Irving did after his failure, but with less than his disappointment, we were enjoying the sweet luxury of the first whiffs when the miller's younger brother offered to take one of us up the lake to the extreme end, among some grassy channels we had not the patience or muscle to explore.

The offer was too tempting, considering the labor involved, to refuse; and one of us immediately stepped into the ark with the lad, and were pushed off with a bon voyage for our hour's cruise.

Patiently, from necessity, the shore was whipped, all the way up, among the logs and brush which lined it, and only a few flies were lost, and only then because time and labor were of essence, and it was cheaper to yank the fly off than to paddle the barge 50ft. back. Nothing for all this labor but the satisfaction of seeing when too late a great break from two or three good fish lying in unsuspected because impossible places; and we came at last to the channels in the tall grass on a smaller scale, but otherwise much resembling those in a tidewater marsh, and we were astonished to find the place seemed alive with bass. The water was fairly clear, with a bottom of marshy mud, and every fish that moved left a spreading cloud of creamy mud in his wake in his wild rush for deep water, and these boils were all about us; further on, nearer the grass patches, they were on the feed, but our craft was so unwieldy it was difficult to approach with the necessary quiet. Fortunately it was comparatively steady, and admitted the effort of long casts; we worked hard at both ends of the boat—the paddle for quiet and the rod for reach—and found pretty sport. In two of the channels we picked up a dozen good fish, one of 3½, one of 3 and one of 2½lbs. we kept, and the rest we tenderly replaced; and some of them would have been prizes on other days we have known.

The other two channels were not disturbed, for at the other end of the lake we knew there was an anxious angler who was entitled to his share of undisturbed

water, and who would have several thrills of triumph, fear and hope when he saw our catch. A hundred yards away we could land the scow and save the long voyage, so we turned its nose shoreward and took to the woods, and yelled across the lake to put on a yellow-sally and a black dropper, and that's just what that angler was doing when the bass were laid at his feet. He had faith enough in the tone, and maybe in his friend, to feel it was well-meant advice and likely to earn a reward if followed.

This illustrates on what slender and untenable grounds many of the angler's prejudices and convictions are founded. The battery recommended, of yellow and black, had been successful, therefore must be the right one to use. Going up the lake other flies had been tried and lost and replaced, and caught nothing; but it is possible that the other patterns had never been fairly offered to a single fish, and that any color would have succeeded if placed right. But it is the old story that nothing succeeds like success, and a lucky fly may become popular, not by reason of its superior attractiveness for the fish, but only because it got there on some occasion when any would have served. The young boatman, enthusiastic over his first lively experience of what the fly could do, volunteered to guide him to the boat and manage it for him, and had done so nicely it seemed a pity to disappoint him by refusing. Of course that was the only reason for consenting, so one was content to kill the fish and finish his cigar while the other went on and as nearly as possible duplicated the performance.

It is needless to say that two comfortable fishermen left the lake that evening, promising themselves just such another day soon; and the lake hasn't been clear since. There are large springs in the bed of the pool, but the shallows are muddy. The fish are light-colored, much lighter than in the river even, but the flavor is good—at least the three friends who ate these said as much.

HENRY TALBOTT.

Sea Fishing on the Jersey Coast.

ASBURY PARK, N. J., March 25.—Flounders are taking the hook on our tidal streams, and are giving good sport to the enthusiastic. Herring are abundant, and are of good size and in good condition. As I mentioned two weeks ago, the promise for early fishing is of the best. I have seen some splendid specimens of kingfish the past week in the Philadelphia markets. Of course they are from the Carolina coast, but the evidence is indisputable that the fish are on the northward move. Shad too are unusually fine and abundant.

To the angler of this section there is no stronger inducement than the white perch offers at this period of the year. A knowledge of haunts and habits is essential to success. To the skeptic I would say there are surprises in store for him if he will use the tackle devoted to the lord of the brook, and a tithe of the patience and skill devoted to the capture of fontinalis. That the perch is nomadic in habit those familiar with him will readily admit, and in order that success be assured a careful canvass of grounds and waters is essential. Why it is that the Raritan should each year give us the earliest reports of the striped bass is a mystery. On the best of authorities I learn that bass of large size have been taken in the herring nets and distributed in Newark and other nearby cities during the past ten days. Where are the anglers of that vicinity, that they do not improve their opportunity and learn if these same bass are not hungry and ready to take the hook? The flounder and perch I have personally visited, and will pay my respects to the bass in the near future, and report my luck.

LEONARD HULIT.

The New Hampshire Season.

NEWFOUND LAKE, Bristol, N. H., March 18.—Hotel men and farmers who take summer boarders are now turning their attention to fishing tackle and boats, so as to be ready when the ice leaves the lake to try the landlocked salmon and lake trout, as this lake is noted for its good results to fishermen. In a visit to the State hatchery on the shore of the lake we noted 250,000 landlocked salmon eggs, 750,000 lake trout eggs, 100,000 brook trout fry, 30,000 whitefish fry. The eggs were eye-marked and healthy in appearance. The salmo fontinalis fry were active, as brook trout usually are. Temperature of water in hatchery, 32 degrees Fahrenheit.

There has been no fishing through the ice the past few winters, so the spring fishing is better every year. We are to have a new launch on the lake this spring for the use of fishermen—something that has long been needed here.

LANDLOCKED SALMON HOUSE.

Artificial Minnows.

ELIZABETH CITY, N. C.—*Editor Forest and Stream:* The shooting season being over, the next best thing is fishing. I have often wondered why some enterprising fellow does not get a good imitation of a live minnow, say about 1 to 3 in. long, flexible, bright, and to show scales, with only one hook, and that through the back just under the back fin. As this is the way live minnows are hooked, in this way only will an imitation look natural. Most of our fresh-water fish, such as perch and black bass, will take a minnow in preference to any other bait. There may be something of this in a minnow, but I have not seen it in any of the catalogues.

J. B. F.

Salmon in Lake Michigan.

CHICAGO, March 26.—A Columbia River salmon was caught in Lake Michigan by a fisherman near Peshtigo Point, in Green Bay, on the Wisconsin shore, last week. The fish was marketed at Marinette, Wis. Some years ago a quantity of salmon fry was deposited in Green Bay waters, but up to this time nothing had ever been heard of them.

E. HOUGH.

FOR SALE.—Hunting and fishing preserve in Adirondacks. 12,000 acres forest land; several fine lakes, 15 miles trout streams. Deer in plenty. 14 miles from railroad. A. A. Leonard, Knickerbocker Athletic Club, New York.

The Kennel.

Curative Qualities of Canine Saliva.

WINDSOR, N. C., March 20.—*Editor Forest and Stream:* While reading Mr. J. J. Meyrick's article on hydrophobia in your issue of the 12th inst., in which he says, "No one should allow a dog, although apparently healthy, to lick any part of his skin," I was reminded of my boyhood days on the old farm. My father was a slave-owner, and Luke, a bright boy some years my senior, was assigned to me as nurse and companion. Together we roamed the fields and woods, and hunted and fished.

When warm weather came on we dispensed with shoes and stockings. The consequence was that we would get sores on our feet, which the negroes called "dew poison," and which quite often would be very sore indeed.

My father owned a turkey dog called You Know; did you ever hear this name? Now old You Know seemed to have a very strong desire to lick the sores on Luke's feet. Luke did not object, and it did not take long to learn that an application of You Know's tongue was a sure cure for sore feet.

Luke dubbed the dog Doctor, a name which he carried until his death; and I might add that he was entitled to this distinction, as he practiced on all the boys on the farm and never failed to cure any case.

None of his patients had hydrophobia.

A. S. R.

Parrish's Fritz.

HAVING had a request for the pedigree of Parrish's Fritz, we wrote to Mr. C. C. Warfield, who replies: "I cannot furnish the pedigree of Fritz, and I doubt if any one can. He is by a pointer of old native stock, called Damon, out of a bitch which I have every reason to believe was a dropper. This is what I gathered when trying to find a pedigree for Fritz at his old home in Herman, Minn. He was bred by a pot-hunting Dutchman, who wanted a bird dog, pedigree or no pedigree; anything would do that would find chickens."

Yachting.

As a part of the speedy preparation for possible war with Spain, the Navy Department has within the past week purchased four steam yachts, the Watson boat Hermione, the Columbia, designed and built by the Cramp Co., and the Almy and Alicia, designed and built by the Harlan & Hollingsworth Co. In addition to these it has examined a large number of others offered for sale, in most cases at a good price. The Sovereign, designed by J. Beavor Webb, was desired, but her owner, M. D. C. Borden, who has owned her only for a couple of seasons and uses her constantly, did not wish to part with her. It is stated that he asked \$400,000 for her, which price was deemed too high.

The four new purchases are at the Brooklyn Navy Yard, where they are being altered as rapidly as possible and fitted with a suitable armament. With them are several of the largest and fastest New York and Boston tugboats.

The Spanish Government has purchased the fast steam yacht Girolda of H. C. McCalmont, the price stated being \$300,000. She has a speed of at least twenty knots. It is stated that she was examined by representatives of this Government, but the price was considered too high.

At a special meeting of the Lynn Y. C. on March 26 it was decided to issue a challenge to the Quincy Y. C. for its new cup, the challenger being C. D. Mower, whose very successful Vitesse, of his own design, will be replaced by a new boat this year.

THE official publication of the declaration of trust of the Quincy Y. C. has proved true what we supposed from the first was the case, that the Boston Herald, for ends of its own, has deliberately misstated the facts concerning the origin and aim of this cup. Contrary to the Herald's direct statements at various times through the winter, it is not an international cup, and in establishing it the Quincy Y. C. had no intention of superseding the Seawanhaka cup. In its efforts to discredit the latter club, the Herald has placed the former in a very false position.

At the present time the Herald, through motives of mere spite, is engaged in the congenial task of trying to disrupt the Massachusetts Y. R. A., fortunately without the slightest prospect of success.

Memories of Boating Days.

(Continued from page 254.)

In looking over my diary I find that we went codfishing several times during the fall of 1887. Of late years these fish have become very numerous on the south side of Long Island, and can be caught very close in shore. Last fall they swarmed in through Rockaway Inlet and up the steamer channel almost to the beach. It used to be a rather risky venture for a small boat to go out codfishing at this time of the year, as she was compelled to go well off shore and quite a distance down the coast toward Long Beach or Fire Island; a storm was liable to arise very suddenly, and in a snowstorm or a freezing gale from the northwest the bold fishermen sometimes experienced trying times beating home, especially against an ebb tide. The current runs like a mill race in Rockaway Inlet, and it is hard enough to sail against it with a fair wind. In thick weather and a head wind it is a long and tedious tussle and not unmixed with danger. Many a craft has found her last resting place on the sands of the Rockaway Shoals.

Well, as I started to say, we went codfishing. Our first trip came near being our last, inasmuch as our experience on this trip was so severe that we very nearly made up our minds never to go out again in the winter months.

I remember it well. My diary says it was on Election day, Nov. 8, 1887. We had made extensive preparations for this event. In addition to the drop lines, a trawl with about 150 hooks on it had been prepared, and we set sail with great expectations of how the ocean was about to be depopulated.

To set the trawl we had to have a row boat, and our tender not being large enough we hired a skiff, the biggest one we could find, for we were aware that the water might be rough outside, and a stiff boat would be desirable. On the way out the skimmers, which are used for bait, were opened and the trawl was baited up and coiled in a tub all ready to set.

It was a gray morning, a fresh northwest breeze blowing and no indications apparent of dirty weather. We went out on the last of the flood, and reached the grounds in about an hour. Monaitpee was anchored, and then the captain and I got into the skiff and rowed away a short distance and put down the trawl. This proceeding occupied nearly a half hour; not being old hands at the business considerable time was lost on account of the hooks becoming tangled. At last the job was finished, and we started to row back to the yacht.

As we did so a few flakes of snow were observed floating through the air, and on glancing shoreward we were surprised to see how hazy it looked toward the north. "I guess we're in for some fun, boys!" said the captain, as he climbed aboard. "I have been watching that for some time," said the cook, "and I think the sooner you run that trawl and get it alongside the better." We all agreed that the weather was beginning to look nasty. The flakes became more numerous and gusts of wind began to make long black patches of ripples on the surface of the water. We lost no time in raising the trawl, hauling it hand over hand into the boat, and throwing it into the bottom with what few fish there were still on the hooks, and then returned to Monaitpee.

The snow was now flying thick and the increasing wind was blowing it rapidly along, almost parallel with the surface of the ocean.

"Turn in a reef!" said the captain quietly, as he made the painter of the skiff fast to the cleat on deck. It was quickly done, the mainsail run up and the anchor brought under the bowsprit and catted. "Give here the jib!" In a moment the sail was set, and hauled to windward to pay her off. She heeled to the wind and dashed away so suddenly that the tow line of the skiff came taut with such a jerk that it sent a thrill through the yacht. We headed toward the beach on the first tack in hopes of bringing the land in sight again, for it was now entirely lost. Should the wind change while we are thus shut off from a view of the shore we might unconsciously alter our course and sail in a direction contrary to the one which should be pursued. Even if the beach could not be seen the sound of the surf would be a guide in beating up to the Inlet.

The gale increased rapidly; gust after gust, each angrier than the preceding, charged down on our yacht, and sent the lee deck beneath the frothing seas that swept by us. The helmsman had his hands full as he skillfully nursed the boat through each blast. As he slightly luffed at such times the noise of the slating canvas was almost deafening, and it seemed as though the sails would tear themselves loose from their lacing.

Although we were all piled up to the windward side it was not long before we became convinced that another reef would have to be tied in. A strong puff laid her down to the cabin lights. The captain put down the tiller and threw her into the wind. She raised her nose into the air defiantly and dropped it into the next oncoming wave, which foamed over the bow on to the forward deck and splashed viciously against the front of the cabin. I scrambled forward and let go the jib, and realized that I was in for a disagreeable job when the captain sang out that I should "bob" it. As I sat astride of the bowsprit struggling to keep my balance and at the same time reduce the jib to the size of a pocket handkerchief I was plunged repeatedly to my waist in the cold water, as the boat pitched into the hissing billows. But my Irish was up, and I mentally resolved that I would bob the rag if it took an hour to do so. Success crowned my efforts eventually, and I pulled myself on deck again, feeling very chilly.

The mainsail had already been double-reefed, and I ran up the jib and we started off once more, plunging and rolling at a great rate. All hands looked like snow men, as they sat perched upon the windward rail. The captain had his oilers on, the coat collar turned up around his ears, and a sou'wester pulled down on his head until all that could be seen of his face were his eyes and nose. Intent on sailing the boat, he appeared to notice no one, but kept his eyes fixed steadfastly ahead, while the tears trickled down his cheeks and dropped off the end of his "horn," brought forth by the piercing wind.

Our passenger, Mr. C., appeared very nervous, and was continually inquiring of the captain if there was any danger, and how long would it take us to get in, etc. He replied that he could tell him better when we got there. This did not reassure him, and he gazed wistfully ahead and remarked that if he ever did get on land again he would never leave it.

For three solid hours we banged away, and then suddenly the cook, who had been stationed forward, yelled: "Breakers ahead! Go about, quick!"

We knew we were approaching the Inlet on account of the enormous seas, and were feeling our way along in hopes of sighting the channel buoy. The tide, helped along by the northwest wind, was pouring out so fast that it appeared sometimes that we were going astern instead of ahead. The big boat we were towing was a terrible drag; when Monaitpee would dash into a big wave her speed would diminish and the skiff, shooting down the receding one, would sometimes bang her nose into the counter, and then, as our yacht burst through the surge and sprang forward again, the painter would snap taut with such a jerk that we would be brought almost to a standstill. Thinking to relieve the yacht, I cast off the painter, and taking a firm hold sat down on the cockpit floor, but the next moment I was yanked bodily along and brought up against the rail with a thud. The rope was twisted around the wrist, and I thought my arms would be pulled from their sockets. As soon as it slackened again I made it fast once more to the cleat.

"A Disagreeable Job."

And so we worried along, getting colder and wetter as the spray flew in our faces, and we felt as though our bones would crack should we move about. When the cook cried, "Breakers ahead!" we forgot our numbness, and as the boat swept round we jumped to our feet and peered anxiously in the direction we had been going and all hands heard the roar of the surf. We laid off on the starboard tack for twenty minutes, and then went about again. We had only settled down on this leg a short time when suddenly the skiff gave an extra hard tug at her rope, and "snap" went the cleat.

"There she goes!" exclaimed the cook.

"Let her go and be hanged!" said Mr. C.

"Not by a long shot, unless you are willing to pay for her!" exclaimed the captain.

Mr. C. making no answer, the yacht was put about, and away we flew down the wind, while the following waves seemed to play tag with us.

In a few minutes we had shot past the runaway, and hauled up on the wind again and headed our course so as to allow the boat to drift down on to us. As she came dancing along sideways the captain luffed a little, and the bow of the skiff banged against the yacht. We seized the painter and quickly made it fast to the rudder head.

"Ahoy, there!" called a voice from somewhere, and we gazed about us wonderingly.

"There she is!" cried the captain, pointing over the port quarter.

Sure enough, there were the dim outlines of a small schooner plunging along in a mass of foam and headed on the same tack as ourselves. She bore down a little closer to us, and we perceived the forms of four men on board, and they were peering at us curiously. The schooner was sailing with all lower canvas reefed down.

"Ahoy, there! What're ye doin' out here?"

"Trying to get in."

"Havin' a hard time, ain't ye?"

"Rather. Have you any idea where the channel buoy lays?"

"Just past the outer mark back yonder. Where ye bound for?"

"Sheepshead."

"Wal, we're headin' fer Canarsie, an' I guess if we keep up tight on the port tack as we're goin' naow we'll 'bout fetch through the Inlet. We've been thrashin' around huntin' fer that stake fer over an hour ourselves. Weather purty thick, ain't it?"

We said it was "worse than that," and as the schooner drew ahead we yelled our thanks after them for the information given us.

Presently we became aware that the snow was letting up some, and we could easily keep the vessel in view, although she was an eighth of a mile in advance, and in less than a half hour it had ceased altogether, although the gale was yet in full force. We found ourselves fairly in the channel and the breakers were lashing the shoals on either hand until everything was white. Dry Bar on the right was a fearful sight; a boiling mass of foam for a distance of half a mile.

Now that we had our bearings and could see that we were making headway slowly but surely against the current we began to take stock of ourselves. We were half-frozen and we beat our arms against our sides to start the blood circulating. I found my trousers, which I had not changed since reefing the jib, were frozen stiff, so that when I beat them they cracked like cardboard. The captain advised me to go into the cabin, take them off and roll up in the blankets. I followed his advice and went below, feeling more like a wooden man than a live one. About an hour later, as I lay bundled up in the lee bunk, the cook yelled down the companion the information that we were entering the bay: twenty minutes later I felt the yacht come to an even keel and heard the rattling of canvas, the anchor splashed, and I knew we were safe in port again.

The cook came in and started a fire in the stove, and presently we were all changing our garments and getting thawed out.

On examining the row boat we found about gin of water in her, which was frozen around the edges. There were three codfish, quite a number of skates and a dogfish, and all were stiff as sticks. There was another cod in the cockpit of the Monaitpee, which the cook had caught on a hand line while we were setting the trawl, so we each had a fish.

After this experience we were very cautious about going off shore during the winter. We went twice afterward before laying up, but did not go so far to the eastward. We got good fishing each time and the weather was all that could be asked for. On one of these trips we shot several black ducks and a brant, besides some loons and a couple of hell-divers.

On Nov. 27 we sailed Monaitpee up to Brooklyn

and hauled her out into the old ferry house at the foot of Bridge street, alongside of Poillon's shipyard. Our yachting seasons usually lasted from eight to nine months. As we always did the work ourselves, connected with the fitting out of the boat in the spring, it was necessary to begin early. We took great pride in keeping Monaitpee in good shape, and therefore were usually hard at work before the end of February, that we might have plenty of time to put her in good trim before launching. Thus in the spring of 1888 we were well along with these duties when the memorable blizzard arrived.

[TO BE CONTINUED.]

Yacht Measurement.

DRESDEN, Germany, March 8.—*Editor Forest and Stream:* About a year ago I had the honor of submitting to the readers of the FOREST AND STREAM a new formula of measurement, though at the time I had no serious idea that this formula would attract that attention on the part of yachtsmen which I am bold enough to believe it deserves on its intrinsic merits.

Some days ago I was informed that Mr. N. G. Herreshoff had proposed a new formula, which would probably be adopted by the Seawanhaka Corinthian Y. C., this formula being

$$\frac{L \times \sqrt{S.A.}}{75 \times \sqrt{M.}}$$

M. being the midship section.

Having examined this formula carefully, I feel that in the interest of yachting it would be a matter of serious regret if it were adopted by the American clubs, as it must give most unsatisfactory results. It not only taxes the sail area too heavily, but has other undesirable features. For instance, two yachts, one of 20ft. l.w.l. and one of 30ft. l.w.l., have the same area of midship section and sail. If

$$\frac{\sqrt{S.A.}}{C \times \sqrt{M.}} = 1,$$

their corrected lengths by this formula will consequently be 20 and 30 respectively, which is absurd.

The formula proposed by me last year would under the same conditions give corrected lengths of 20 and 26, instead of 20 and 30; or, if the proportion of the corrected lengths were still 20 and 30, the 30ft. l.w.l. yacht would be allowed 50 per cent. more sail than the 20-footer. That she would need this extra amount, in view of her greater displacement and wetted surface, will be readily understood.

Even the old Seawanhaka rule gave better results in this respect, however faulty in other respects through its failure to take account of the area of midship section or some equivalent factor. G. R. LILJEGREN.

The formula proposed by our correspondent in the FOREST AND STREAM of April 10, 1897, is

$$R.M. = \frac{\sqrt[3]{L^2 \times S.A.}}{C \times M.} \text{ or } R.M. = \frac{\sqrt[3]{L^2 \times S.A.}}{C \times D.}$$

M. stands for midship section, D. for displacement, and C. for a constant.

Mr. N. G. Herreshoff, who long ago gave his name to the table of allowances which has been so generally used in this country, has devoted much thought to the subject of measurement, and though he has made no positive suggestion as to a new rule, he has, on request, furnished to others interested in the same subject several tentative formulas devised by him. We do not know whether he considers any of these as of sufficient merit to warrant its general adoption, or whether they are to be taken as merely suggestive and a basis for further work. The following formulas were given by him to some members of the North American Y. R. U. last fall:

1. Immersed midship section, $R.M. = \frac{L \times \sqrt{S.A.}}{7.5 \times \sqrt{M.}}$
2. Full midship section, $R.M. = \frac{L \times \sqrt[3]{S.A.}}{5.5 \times \sqrt[3]{M.}}$
3. Cubic contents, $R.M. = \frac{L \times \sqrt{S.A.}}{4 \times \sqrt[3]{C.C.}}$
4. Cubic contents, $R.M. = \frac{L \times \sqrt[3]{S.A.}}{7 \times \sqrt[3]{C.C.}}$
5. Displacement, $R.M. = \frac{L \times \sqrt{S.A.}}{5 \times \sqrt[3]{D.}}$

The International Races of Portugal.

THE present year is the fourth centenary of the discovery by Vasco de Gama of the sea route to the Indies, and the occasion will be celebrated by a national jubilee under the auspices of the Government of Portugal. The extensive programme, including a Te Deum of Portuguese composition, a meeting of the Geographical Society of Lisbon, an exposition, naval and military reviews, etc., also includes a series of sailing and rowing regattas, for costly prizes, the principal one being the Vasco de Gama cup. The full programme is as follows:

SAILING PROGRAMME.

May 15, 1898—at Cascaes.

Match No. 1—For yachts exceeding 60 L. R.—First prize Vasco da Gama cup, £200, and a gold medal. First: The cup to remain in possession of the club to which the winner belongs and to constitute a perpetual international prize. Second: This prize can only be disputed in races where two or more clubs join. Third: The race to be annual or in period not exceeding three years. Fourth: The organization of the race to be entrusted to the club in possession of the cup, with the co-operation of the Lisbon Geographical Society of Lisbon, and of the Portuguese naval clubs, if deemed convenient by said club. Fifth: The race to take place at Cascaes. Second prize £100 and a gold medal. No second prize will be given unless four yachts start. Course 60 miles.

Match No. 2—For yachts of 50 L. R., but not exceeding 60 L.R.—First prize £100 and a gold medal; second prize £50 and a silver medal. No second prize will be given unless five yachts start. Course 40 miles.

Match No. 3—Handicap for cruisers exceeding 20 Thames tons Lloyds' Yacht Register. Prize, a cup offered by H. M. King D. Carlos I., £50 and a gold medal. Course 40 miles.

Match No. 4—For lateens (Cahiques).—Prize Réis 350\$000. No prize will be given unless five boats start. Course 40 miles.

Match No. 5—For lateens (Canôas da picada).—Prize Réis 350\$000. No prize will be given unless five boats start. Course 40 miles.

May 16, 1898—at Peco d'Arcos.

Match No. 1—Handicap for cruisers exceeding 5 tons, but not exceeding 20 Thames tons Lloyds' Yacht Register. Prize £30 and a silver medal. Course 20 miles.

Match No. 2—Handicap for yachts exceeding 2½ tons, but not exceeding 5 Thames tons Lloyds' Yacht Register. Prize £15 and a silver medal. Course 10 miles.

Match No. 3—Handicap for yachts not exceeding 2½ Thames tons Lloyds' Yacht Register. Prize £15 and a silver medal. Course 10 miles.

First: All matches are open to yachts of any rig belonging to any recognized club.

Second: All races will be sailed under Rules of Yacht Racing Association, 1897.

Third: The yachts taking place in the matches Nos. 1 and 2 of May 15 must when making their entries present their certificates of measurement (L. R.), which will serve for regulating the time allowances.

Fourth: The committee reserve the right of making any alter-

"There she is!"

ation they may deem expedient and of postponing the regatta should they consider it advisable to do so.

Fifth: The decision of the committee on all matters to be final.

Sixth: The committee also reserve to themselves the power of refusing any entries.

Seventh: Any protest must be accompanied with a deposit of £4, which shall be forfeited to the regatta fund should the protest be rejected.

Eighth: A steamer will accompany the matches every day.

Ninth: Entries for the matches to be made in accordance with the rules of the Yacht Racing Association and addressed to the Commissao Executiva do Centenario da India, Sociedade de Geographia, Lisboa, on or before April 15, 1898.

ROWING PROGRAMME.

May 17, 1898—at Lisbon.

Match No. 1—For skiffs.—Prize gold medal.
Match No. 2—For outriggers (four oars).—Prize gold medal.
Match No. 3—For six-oared gigs (first class).—Prize gold medal.
Match No. 3—For six-oared gigs (first class).—Prize gold medal.
Match No. 4—For four-oared gigs (first class).—Prize gold medal.

Match No. 5—For six-oared gigs (second class).—Prize gold medal.

Match No. 6—For four-oared gigs (second class).—Prize gold medal.

Match No. 7—For six-oared boats belonging to Portuguese and foreign men-of-war.—Prize £10 and copper medal.

Match No. 8—For eight-oared boats belonging to Portuguese and foreign men-of-war.—Prize £10 and copper medal.

Match No. 9—For ten-oared boats belonging to Portuguese and foreign men-of-war.—Prize £10 and copper medal. Course one mile.

If any of the men-of-war boats are steered by a naval officer a gold medal will be awarded to the officer of the winning boat.

First: All races will be rowed under the rules of Henley regattas.

Second: The committee reserve the right of making any alteration they may deem expedient, and postponing the regatta should they consider it advisable to do so. The decision of the committee on all matters to be final.

Third: The committee also reserve to themselves the power of refusing any entries.

Fourth: Any protest must be accompanied with a deposit of £2, which shall be forfeited to the regatta fund should the protest be rejected.

Fifth: Entries for the matches to be made in accordance with the rules of Henley regatta and addressed to the Commissao Executiva do Centenario da India, Sociedade de Geographia, Lisboa, on or before April 15, 1898.

YACHTING NEWS NOTES.

Tillie, steam yacht, formerly Polynia, has been sold by the estate of the late W. H. Starbuck to Lewis Luckenbach.

Nahma, steam yacht, Robert Goelet, arrived at Newport on March 27 with owner and friends on board, from the West Indies. She will proceed to New York.

Penelope, steam yacht, under charter to John Shepherd, of Boston, arrived at Kingston, Jamaica, on March 9, from Tampa, and sailed for La Guayra.

Silva, steam yacht, has been sold by J. H. Metcalf to A. B. Banks, through her builders, Seabury & Co.

The shops of John W. Sullivan are like a bee hive; work is carried on day and night. Among the orders are the four cylinder triple-expansion engines for E. W. Bliss' new steam yacht, building by John N. Robbins; a triple-expansion engine, 9½, 14 and 24 by 14in., for a passenger propeller building for Orlando F. Smith, of Westerly, R. I.; a triple-expansion engine, 12, 18 and 20 by 20in., for Lewis Nixon, to be placed in the steam yacht building for Tams & Lemoine; an engine for Capt. Ed Brandow's new tug; a triple-expansion engine, 10, 15 and 25 by 15in., for the steam yacht Ava, owned by Walton Ferguson, 11 Pine street, this city, the owner of Fisher's Island.—*American Shipbuilder.*

Nourmahal, steam yacht, J. J. Astor, arrived at New York on March 24, from New Orleans and Honduras, her owner coming from New Orleans by rail.

The second general meeting of the New York Y. C. was held on March 24, with Vice-Com. Ledyard in the chair. The following amendment to the racing rules was passed: In Rule IV., Section 5—Any yacht alone in her class may sail in the class next above, but in such case such yacht shall assume and be entered as of the mean racing length specified for the class in which she so enters; but this shall not be so construed as to permit a single-masted vessel or yawl to enter a schooner class. Substitute the word minimum for mean.

J. G. Bennett presented to the club three chart plates of the North and South Atlantic, the Mediterranean and Indian oceans, and the Suez Canal, which will be printed for the use of members. Robert M. Grinnell presented to the club the American ensign carried by the Advance, brig, Dr. Kane, in the Franklin search expeditions of 1850-53. The following were elected members: Geo. J. Bascom, Dwight Bradford Blossom, Thos. S. Loeser, Charles N. Nelson, William Austin Wadsworth and Thos. Hammond Smith.

Sultana, steam yacht, J. R. Drexel, arrived at Patras on March 8, sailing the same day, on March 10 she called at Palermo.

May, steam yacht, Mrs. Alex. Van Rensselaer, and Barracouta, steam yacht, D. P. Reighard, were at Kingston, Jamaica, on March 21.

Scythian, steam yacht, Miss Susan De Forest Day, sailed from Charleston for Hampton Roads on March 21.

Narada, steam yacht, Henry Walters, sailed on March 8 from Nice for Naples.

Andria, steam yacht, J. E. Brooks, arrived at Gibraltar on March 9.

Felicia, steam yacht, building for E. W. Bliss at J. N. Robins' yards, Erie Basin, will be launched on Saturday, April 2 at 3:30 P. M.

The annual open regatta of the Brooklyn Y. C. will be sailed on Monday, June 13. A special cup will be given for the knock-about class.

Bucaneer, steam yacht, W. R. Hearst, has been fined \$200 under Sec. 5 of the act of Jan. 16, 1895, for carrying newspaper correspondents and dispatches between Havana and American ports.

The Saddle and Cycle Club, of Chicago, will establish a yachting department at Edgewater, on Lake Michigan, building a boat house and pier.

Nooya, steam yacht, has been sold by E. N. Dickerson to W. K. Aston, through Mr. Crowninshield. This gentleman has just booked orders for four designs: a 30ft. yawl for F. W. Hastings, of Cambridge, Mass., a cruiser, with 9,000lbs. of lead on keel; a 21ft. c. b. knockabout for New York, 32ft. 3in. overall, 8ft. 4in. beam, 7ft. 10in. beam at l.w.l., 3ft. 4in. draft and 600sq.ft. of sail, with knife centerboard and balanced rudder; a 21ft. keel knockabout for E. C. Lambert, of Cambridge; and a 17ft. power launch for Meteor, schr., J. O. Shaw, Jr.

At the annual meeting of the Corinthian Y. C. of San Francisco the following officers were elected: Com., Carl Westerfield; Vice-Com., Andrew Thorne; Port Capt., J. H. Keefe; Sec'y, E. B. Lathrop; Treas., C. E. Barrett; Directors: C. Westerfield, A. Thorne, J. H. Keefe, E. B. Lathrop, C. L. Barrett, O. Eastwood, F. E. Schöber; Regatta Committee: J. H. Hopps, W. F. Dixey, R. J. Martenstein; Delegates to the Pacific Interclub Y. A. appointed March 3: J. H. Hopps, A. J. Young, P. J. Martenstein.

A. C. A. Membership.

APPLICATIONS for membership may be made to the purser of the division in which the applicant resides on blanks furnished by purser, the applicant becoming a member provided no objection be made within fourteen days after his name has been officially published in the FOREST AND STREAM.

Atlantic Division.

W. F. Penney, New York.

Eastern Division.

George C. Scales, Newton, Mass.

Wilson S. Dakin, Wish-ton-Wish, Northampton, Mass.

The FOREST AND STREAM is put to press each week on Tuesday. Correspondence intended for publication should reach us at the latest by Monday, and as much earlier as practicable.

H. M. SPENCER'S TARGETS IN THE GERMAN RING RE-ENTRY RIFLE MATCH.

Five best scores to count, 100ft., off-hand, possible 375. Score 373.

Rifle Range and Gallery.

Scores at the Boston Tournament.

Boston, March 26.—The two weeks of shooting in the New England Sportsmen's Association tournament closed to-night with the following records:

Match A.—Any revolver championship: Prizes, three sterling silver cups, actual cost \$50, \$25 and \$10. Conditions: Arms—Open to any revolver of not over 45cal., with barrel not over 7½in. in length, exclusive of cylinder. Sights must be strictly open and not over 9in. apart. Trigger-pull shall not be less than 3lbs. Position, standing without rest or support, shooting arm extended, elbow free from the body. Targets will be the standard American reduced to 20yds. Number of shots: This match calls for 50 consecutive shots, which must be finished within 25 minutes from the first shot. Cleaning allowed between scores. Ammunition: Any ammunition of not over 12grs. black powder, or its equivalent in smokeless, allowed. Entrance fee for this match is \$5. Distance 20 measured yards. Entries: Only one allowed by the same individual. Ties will be shot off.

First prize won by R. H. Sayre, score 443. Second by E. E. Partridge, score 430. Third by G. W. Waterhouse, score 428.

Match B.—Military revolver championship: Prizes, three sterling silver cups, actual cost \$50, \$25 and \$10. Conditions: Arms—Open only to the present standard .38cal. revolver as issued by the United States Government to the troops. Sights must be the regular open and fixed military sights with which the revolver is issued. Trigger pull shall not be less than 4lbs. Position, standing without rest or support, shooting arm extended, elbow free from the body. Targets will be the standard American reduced to 20yds., with Creedmoor count. Number of shots: This match calls for 50 consecutive shots, which must be finished within 25 minutes from the first shot. Cleaning allowed between scores. Ammunition must be the regular full charge service cartridge intended for this arm. Entrance fee for this match is \$5. Distance 20 measured yards. Entries: Only one allowed by the same individual. Ties will be shot off.

First prize won by E. E. Partridge, score 232. Second by Dr. S. Paine, score 230. Third by Dr. A. A. Webber, score 226.

Match C.—Pistol championship: Prizes, three sterling silver cups, actual cost \$50, \$25 and \$10. Conditions: Arms—Open to all pistols of .22cal., with barrels not over 10in. in length. Sights must be strictly open and not over 10in. apart. Trigger pull shall not be less than 2lbs. Position, standing without rest or support, shooting arm extended, elbow free from the body. Targets will be the standard American reduced to 20yds. Number of shots: This match calls for 50 consecutive shots, which must be finished within 50 minutes from the first shot. Cleaning allowed between scores. Ammunition: Any .22cal. rim-fire ammunition allowed. Entrance fee for this match is \$5. Distance 20 measured yards. Entries: Only one allowed by the same individual. Ties will be shot off.

First prize won by C. S. Axtell, score 457. Second by E. E. Partridge, score 447. Third by G. W. Waterhouse, score 442.

Match D.—Rifle championship: Prizes, three sterling silver cups, actual cost \$50, \$25 and \$10. Conditions: Arms—Open to all rifles of .22cal. Sights: Any sights except telescope sights allowed. Position: The position will be off-hand. Targets: The 25-ring target will be used for this match. Number of shots: This match calls for 50 shots, which must be shot in ten rings of 5 shots each at any time during the tournament. Each string must be finished within 10 minutes from the first shot. Cleaning

allowed between strings. Ammunition: Any .22cal. rim-fire cartridges allowed. Entrance for this match is \$5. Distance 100 measured feet. Entries: Only one allowed by the same individual. Ties will be shot off.

First prize won by F. C. Ross, score 1200. Second by H. M. Spencer, score 1187. Third by D. M. Pope, score 1178.

Match E.—Any revolver re-entry. Prizes: There will be twelve prizes, dividing \$140, as follows: \$30, \$25, \$20, \$15, \$12, \$10, \$8, \$6, \$5, \$4, \$3, \$2. Only one prize can be won by the same individual. Conditions: Arms, sights, position, targets, cleaning, ammunition and distance are the same as in the any revolver championship match. Scores: A score to consist of 6 consecutive shots, which must be finished within 3 minutes from the first shot. Each contestant's final score to consist of the aggregate of his five best scores. Entries are unlimited and are to cost 25 cents per score. Ties will be decided by the next best score or scores.

First prize, cash \$30, won by C. S. Axtell, score 286. Second, cash \$25, a tie between Dr. A. A. Webber and J. H. Wesson, score 285.

Match F.—Military revolver re-entry: Prizes: There will be twelve prizes, dividing \$140, as follows: \$30, \$25, \$20, \$15, \$12, \$10, \$8, \$6, \$5, \$4, \$3, \$2. Only one prize can be won by the same individual. Conditions: Arms, sights, trigger-pull, position, targets, cleaning, ammunition and distance are the same as in the military revolver championship match. Scores: A score to consist of 6 consecutive shots, which must be finished within 1 minute from the first shot. Each contestant's final score to consist of the aggregate of his five best scores. Entries are unlimited and are to cost 25 cents per score. Ties will be decided by the next best score or scores.

First prize, cash \$30, won by E. E. Partridge, score 147. Second, cash \$25, won by R. Robertson, score 144. Third, cash \$20, won by O. B. Joyeux, score 143.

Match G.—Pistol re-entry: Prizes: There will be twelve prizes, dividing \$140, as follows: \$30, \$25, \$20, \$15, \$12, \$10, \$8, \$6, \$5, \$4, \$3, \$2. Only one prize can be won by the same individual. Conditions: Arms, sights, trigger pull, position, targets, cleaning, ammunition and distance are the same as in the pistol championship match. Scores: A score to consist of 6 consecutive shots, which must be finished within 3 minutes from the first shot. Each contestant's final score to consist of the aggregate of his five best scores. Entries are unlimited and are to cost 25 cents per score. Ties will be decided by the next best score or scores.

First prize, cash \$30, won by E. E. Partridge, score 290. Second, cash \$25, won by Z. C. Talbot, score 289. Third won by Dr. A. A. Webber, score 288.

Match H.—German ring, re-entry rifle: Prizes: There will be twelve prizes, dividing \$140, as follows: \$30, \$25, \$20, \$15, \$12, \$10, \$8, \$6, \$5, \$4, \$3, \$2. Only one prize can be won by the same individual. Conditions: Arms, sights, position, targets, cleaning, ammunition and distance are the same as in the rifle championship. Scores: A score to consist of 3 shots, which must be finished within 5 minutes from the first shot. Each contestant's final score to consist of the aggregate of his five best scores. Entries are unlimited and are to cost 25 cents per score. Ties will be decided by the next best score or scores.

First prize, cash \$30, won by H. M. Spencer, making a clean score of 375 points.

Match I.—Standard American re-entry rifle: Prizes: There will be twelve prizes, dividing \$100, as follows: \$20, \$15, \$11, \$10, \$9, \$8, \$7, \$6, \$5, \$4, \$3, \$2. Only one prize can be won by the same individual. Conditions: Arms, sights, position, cleaning, ammunition and distance are the same as in the rifle championship. Targets: The standard American target reduced to 100ft. with 7-ring black will be used in this match. Scores: A score to consist of 5 shots, which must be finished within 5 minutes from the first shot. Each contestant's final score to consist of the aggregate of his five best scores. Entries are unlimited and are to cost 25 cents per score. Ties will be decided by the next best score or scores.

Cash prize of \$20 won by F. C. Ross, score 228.

The scores in detail follow:

Any revolver championship match:												
G W Waterhouse	50	50	53	45	56	56	44	56	18	—	428	
G W Waterhouse	50	50	53	45	56	56	44	56	18	—	423	
Z C Talbot	49	51	45	49	51	58	44	57	20	—	424	
Dr A A Webber	45	51	52	54	43	50	57	54	17	—	423	
Military revolver championship match:												
O B Joyeux	25	29	27	28	27	27	29	29	9	—	230

Shell Mound Range.

SAN FRANCISCO, Cal., March 14.—Yesterday was club medal day at Shell Mound. Most of the marksmen fell down a few points below average on account of a stiff breeze from the northwest. McLaughlin, however, did fine work on the Creedmoor target. Scores of the Columbia Club, Columbia target:
Members' rifle medal: J. E. Gorman, 55, 76.
Bushnell military rifle medal: E. Jacobson, 49, 45.
All comers' rifle medal: D. W. McLaughlin, 46; F. O. Young, 57; A. H. Pape, 48, 50, 57; F. E. Mason, 57.
For members only.—Champion class: McLaughlin 48, Pape 50, Mason 63.
First class: Dorrell 68, Daiss 86, Gorman 88.
Second class: Barley 107, Mannell 111, Mrs. White 199, M. J. White 131.
With the pistol at 50yds. the members of the Columbia Club made these scores:
Champion class: Gorman 38, Pape 41, Dorrell 46, M. J. White 47, Young 52, Daiss 58.
First class: Mason 56, Bailey 79.
Second class: Mrs. White 56, Hinterman 66.
Third class: Jonas 69, Cosgrave 82, Mrs. Mannell 109, G. Mannell 122, Mrs. Waltham 132, Doria 125.
In the rifle contest for ladies Mrs. Waltham scored 53, Mrs. White 55 and Mrs. Mannell 57.
Germania Club, 25-ring target, 20 shots:
First champion class, D. B. Factor 428; second champion class, H. Huber 377; first class, C. F. Rust 366; second class, J. Geiken 373; third class, D. Salfeld 296; first best shot, J. Utschig, 22; last best shot, H. Zecker, 23.
Companies C and G, N. G. C., Blount target: English 28, Northrup 42, Menzel 33, Heilbrone 37, Grant 41, Smith 36, Nelson 34, Povey 42, Kennedy 42, Ross 37, Hirst 44, McGilvery 40, Armstrong 20, Crosbie 19, Mueller 35, Norton 44, Butler 20, Howe 42, Bantz 25, Atkins 35, Sweitzer 42, Kinkead 33, Weatherby 44, Waltham 44, Swasey 38, Williams 41, Fawke 27, Meyer 43, Unfred 39, Hicks 40, Petty 33, Martin 34, Sarsen 37, Dabney 20, Stewart 13, Nilson 20, Neuman 37, Deffen 32, Musgrave 37, Carson 32, Mason 39, Sutcliffe 43.
Five hundred yards: Menzel 26, Povey 23, Unfred 34, Heilbrone 24, Norton 41, Meyer 42, Neuman 35, Musgrave 37, Hirst 41, Weatherby 6, Waltham 33, Sweitzer 16, Kennedy 31, Deppen 32, Carson 27.
Three hundred yards: Menzel 37, Ross 27, Heilbrone 22, Unfred 32, Hirst 37, Norton 44, Netherby 42, Sweitzer 33, Waltham 39, McGilvery 30, Povey 41, Hicks 32, Meyer 38, Kennedy 30, Neuman 29, Deppen 33, Musgrave 39.
ROSEL.

The FOREST AND STREAM is put to press each week on Tuesday. Correspondence intended for publication should reach us at the latest by Monday, and as much earlier as practicable.

Oneida County Sportsmen's Association.

UTICA, N. Y., March 18.—The Oneida County Sportsmen's Association's seventh annual tournament was completed to-day, this being the third day of the shoot. Among the shooters were: J. A. R. Elliott, representing the Winchester Repeating Arms Co.; A. G. Courtney, representing the Remington Arms Co.; E. B. Coe, of the Coast Pigeon Co., of Baltimore; J. J. Hollowell, of the U. M. C. Co.; Jack Fanning, of the Gold Dust Powder Co.; George Mosher, of the Syracuse Arms Co.; E. D. Fulford, representing Remington guns, U. M. C. shells, and Schultze powder, and R. O. Heikes, of the Winchester Arms Co. The Fulford system of trapping was used, and was pronounced by all to be the best ever seen. Scores of

Wednesday, March 16.

No. 1, 5 live birds, \$3 entry; No. 2, 7 live birds, \$4 entry; No. 3, 15 birds, \$8 entry; No. 4, 7 birds, \$1 entry.

Event No. 7, miss-and-out: Heikes 3, Hollowell 2, Fanning 1, Fulford 3, Holloway 3, Paddleford 1, Deck 0, Mayhew 2, Smith 3.

No. 8, same: Heikes 3, Bingham 2, Frank 0, Deck 0, Mayhew 3, Paddleford 1, Holloway 0, Courtney 3, Scott 0, Hollowell 3, Fanning 2, Fulford 3.

Friday, March 18.

The last day saw the best shooting of the tournament. The weather was good, and a large crowd of spectators was on hand. The four special prizes of \$10 each for the four high scores for the entire programme of 101 birds were won by the following men: E. D. Fulford 93, J. A. R. Elliott 87, Jack Fanning 84, J. J. Hollowell 84. The principal event of the tournament, the Central New York Handicap, was shot to-day. Nine men entered. The conditions were: 25 live birds, \$12 entry, handicap rise, 40, 30, 20 and 10 per cent., \$25 added. Event No. was at 7 live birds, \$4 entry; No. 2, 10 birds, \$5 entry; No. 3, same; No. 4, 7 birds, \$4 entry. The scores:

Hollowell, 30	111221210212222222222222	24
Heikes, 30	222222022022122222222222	23

No. 7, same: Gates 3, Hollowell 1, Courtney 4, Fanning 0, Fulford 4.

Trap at Parkersburg.

PARKERSBURG, W. Va., March 19.—The Parkersburg Steam Laundry trophy was contested for by thirteen enthusiastic gun cranks this afternoon. A wild wind prevailed from the southwest and made the shooting very hard. Charles Gilbert tied F. E. Mallory, the State champion, on 44 out of 50, then 21 out of 25; the last 25 was 16 to 21 in favor of Mallory. Ties were shot off late and it being quite dark Gilbert fell down.

The sweeps and practice events were quite interesting; all members are training for the State tournament to be held here under the auspices of the Mountain State Gun Club, June 8, 9, and 10; \$300 added moneys and a long list of merchandise prizes, consisting of guns, loaded shells, powder, shot, etc. The magnum-trap will throw about 10,000 targets per day, and the boys will leave nothing undone to make the event a success and to insure all visiting shooters the best entertainment of the best town in the Ohio Valley. No. 3 was for the trophy:

Events:	1	2	3	4	5	Events:	1	2	3	4	5

Seattle Rod and Gun Club.

SEATTLE, Wash., March 21.—Yesterday's shoot was quite a success, and there were quite a number of shooters out. The best shooting was done by Chellis and Hood. Chellis made one, string of 15 straight, and Hood had two 20-straight; two 10s and broke 14 out of 15 in another event. Stevens is doing better with his gun since he had the stock changed, but he might improve. Ellis is still doing fine work occasionally with his fine English piece. Dr. Steel also shot well, and will probably shoot next week at Tacoma.

The boys are all on their mettle to beat Tacoma, and expect to do so.

Boston Gun Club.

WELLINGTON, March 23.—More visitors to the successful Sports men's Show varied the attendance at the Boston Gun Club on the afternoon of March 23. Messrs. L. I. Flower, A. Moore and G. B. Moore were sightseers from across the line, and while desirous of posing more as spectators than shooters were prevailed upon to handle strange guns and strange ammunition for sociability's sake. Mr. Noone, of the Portsmouth, N. H., Gun Club, shot the programme to good effect, while the regular Wednesday participants were glad to note the return to the grounds of Mr. Brown direct from his winter home in the South, and also Mr. Benton, who has been an unwilling absentee from the later shoots on account of a painful sleighing accident. With all these to make up a gathering, the shoot passed off in good shape, notwithstanding that a gale of wind prevented good scores coming to more than a few. Scores as follows:

Events:	1	2	3	4	5	6	7	8	9	10	11	12
Targets:	10	10	6	10	10	5	6	10	10	10	10	10

BOSTON.

Parmelee Defeats Brewer.

A MATCH was arranged between Mr. F. S. Parmelee, of Omaha, Neb., and Mr. J. L. Brewer, of New York, two great masters of the gun, for \$100 a side, 100 live birds, each contestant to stand at 30yds. The match excited a great deal of interest, in that respect being second only to the great finish of the Handicap. Parmelee was shooting in excellent form. Brewer shot a grand race, but was not up to the high form which he has shown in the past. It was a grand exhibition of high skill with the shotgun. The match began at 11:26 on Friday, March 25, and ended at 1:05. The score subjoined tells the whole history at a glance:

Trap Around Reading.

Reading, Pa., March 16.—One of the closest contested shooting matches ever held around this part of the State was shot here to-day over the traps of the Independent Gun Club at Shilling-ton Park. The principals were Brooke Harrison, who has be-come quite prominent the last few years at the trap, and Harry J. Coldren, champion live-bird shot of Berks county. A match had been made in which Coldren was to stake \$200 to Harrison's \$100, but a report was circulated that it would be a "fake" match, when on the last minute the first match was declared off and a new match made for \$100 a side, each man to shoot at 100 live birds, 28yds. rise, 50yds. boundary.

The match had been arranged to start at 2 P. M., but it was 3 P. M. when Coldren fired the first shot, opening the match. Fully 500 persons journeyed to the shooting park to witness the match and were well paid for their trouble. The grounds, are just receiving the finishing touches for the State shoot, to be held March 29, and present a fine appearance. Mr. Charles W. Bechtel was selected as referee; Mr. Edward Yeager, president of the Independent Gun Club, was trap-puller, and John Shaaber, Mr. Moyer and the correspondent of FOREST AND STREAM were chosen as official scorers.

The birds were a fine lot of strong, healthy pigeons, and no hard wind blew across the traps. Coldren made a run of 18, which was his best of the match, while Harrison's highest run was 22. Nine times throughout the match were the shooters tied. Mr. Ben Fleishman handled Coldren and Kuersten coached Harrison. Over \$4,000 changed hands on the result, and another match is being arranged between the two men. It was rumored after the match that Isaac Eckert and Robert Welsh, of the Riverton Gun Club, Philadelphia, and Harrison and Coldren would shoot a team race, 100 birds per man, \$200 a side per team. Forfeits have been posted and arrangements are to be made at once for the date and place.

The score:
Coldren1211121111222121*211112-24

Dead out of bounds: Coldren 6, Harrison 4.
Reading, Pa., March 16.—This afternoon while the Coldren-Harrison match was being shot, Mr. Bob Welch, of Philadelphia, the guest of Mr. Isaac Eckert, and his host, Mr. Eckert, met in a private live-bird shooting match at Spring Valley shooting grounds. Mr. Geo. I. Bechtel acted as referee. The result at the finish showed Welch killed 86, missed 14, to Mr. Eckert's 87 killed and 13 missed. As soon as the result of the Harrison-Coldren match was learned Mr. Eckert immediately issued a chal-lenge to shoot a team race, 100 birds per man, for \$200 a side, Mr. Eckert choosing Mr. Welch as his partner to shoot against Coldren and Harrison.

Pottstown, Pa., March 16.—A number of interesting target matches were shot on the grounds of the Shuler Shooting As-sociation between teams composed of W. G. Guest, W. I. Grubb and L. G. Davis on one side, and W. L. Stone, Livingstone Say-lor and Thos. Cole on the other.

First event, 25 targets per man, known angles; two unknown angles, while the fourth was at 6 doubles. The first mentioned won each of the three matches with the scores of 49 to 48, 51 to 49, 18 to 15, 19 to 12.

Bally, Pa., March 16.—A live-bird and target tournament was held here to-day and attracted a large number of sportsmen from Potts-town, Royersford, Reading, Phoenixville, Spring City and other places. In the first event at 7 live-birds, \$5 entrance, Trumbauer, of Pottstown, won first money on a straight score. Gross, Buck-walter and Geary divided second money with 6 kills each. The second event was at 7 birds, \$5 entrance. Trumbauer, Scheffey and Brey each had 6 kills and divided first money. Gross and Buckwalter with 5 kills divided second money. There were fifteen entries in each of the above events.

Norristown, Pa., March 16.—There was a live-bird shoot at King of Prussia, near here. The first event was for a purse of \$25 or a 500lbs. hog. The conditions of the match were 3 birds to a man, 28yds. rise, 50yds. boundary. The following scores were made: Gaylor, Newton, Dull, Jenkins, 3; Hoy, Pedrick, Derr, Upden-grove, Hobbs, Dick, Boucot, 2; Marsden, 1. In the shoot-off for first money Dull killed 6 and Newton 5. Gaylor and Jenkins missed their first birds.

Weissport, Pa., March 17.—Sportsmen from all parts of the coal region saw John F. Weiler, of Allentown, defeat P. F. Mur-phy, of Mauch Chunk, at a live-bird shoot for \$50 a side. The shoot was at 10 birds, and each man killed 4. In the shoot-off Weiler killed 2 birds straight, while Murphy missed 1 and lost the match.

ARTHUR A. FINK.

THE GRAND AMERICAN HANDICAP.

THE sixth annual Grand American Handicap tournament of the Interstate Association was fixed to be contested on March 22, 23 and 24, but the last gun which announced the winner was not fired till well toward noon of the 25th. The tournament was held at Elkwood Park, which is a few minutes' ride from Long Branch, N. J. The Central Railroad of New Jersey and the Pennsylv-ania Railroad, near to which Elkwood Park is situated, arranged their schedules so that several trains made stops at the gates of the Park in each of the three days fixed for the event, thus materially aiding the convenience of all who were in attendance.

The entries this year numbered 207, of which 6 were post entries. Of the 207, 10 forfeited, so that the actual number of contestants was 197, a number still far in excess of any entry

E. D. FULFORD, UTICA, N. Y.
Winner of Grand American Handicap, 1898.

preceding it. Last year the entries to the Handicap numbered 146, of which 11 forfeited, leaving 135 contestants, a record breaker at that time. In that contest the Hon. T. A. Marshall, of Keiths-burg, Ill., was the winner.

In comparison the beginning in 1893 was humble, the entries that year numbering 21, and the victor was Mr. R. A. Welch, of Philadelphia. In 1894 there were 54 entries, and that year Mr. T. W. Morfey, of Paterson, N. J., took first honors. The two first events were shot off in a Brooklyn park.

Sixty-one entries in 1895 was a gain over all predecessors, and in the contest of that year at Willard Park, near Paterson, N. J., Mr. J. G. Messner, of Pittsburg, proved to be the winner. The entries of 1896 were a great gain over those of previous years, there being 109, and 106 who competed. That year Mr. O. R. Dickey was the winner.

Excellent portraits of the previous winners, as well as that of the last winner, are given in these columns, thus linking the honors of the present year by year, to those of the beginning of the greatest trap-shooting event in America, and in point of the number of entries, without doubt, the greatest in the world.

As each recurring Handicap exceeded its predecessors, there was the greatest difficulty in the practical management of it up to two years ago, owing to the insufficient equipment of grounds for its peculiar needs. The large entry of 1896 made necessary the running of extra sets of traps, which in turn made necessary a new system of scoring to meet the new requirements, and

further suggested the need of quicker trapping and retrieving, all of which were so nicely perfected that the opportunities to shoot in the last two Handicaps kept nearly an even pace with the re-quirements of the shooters at the score.

To accomplish all this so perfectly every important part of the management of the shoot was in a high degree specialized. The Interstate Association engaged only the best trained talent for every working department of the tournament, with the result that it was conducted from start to finish without any material break.

Elsewhere in our columns are portraits of the President, Vice-President and Secretary of the Interstate Association respect-ively, Mr. J. A. H. Dressel, of Union Metallic Cartridge Co.; Mr. Irby Bennett, of Winchester Repeating Arms Co.; and Mr. John L. Lequin, of Hazard Powder Co. These gentlemen, with Capt. A. W. Money, of American E. C. & Schultze Powder Co., Limited; Mr. A. W. Higgins, of Laffin & Rand Powder Co., and Mr. Edw. S. Lenthion, representing E. I. du Pont de Nemours & Co., composed the Board of Directors.

The Tournament Committee were Messrs. Irby Bennett, Chair-man; A. W. Higgins, Charles Tatham, John L. Lequin and E. S. Lenthion.

THE HANDICAP COMMITTEE.

As originally arranged the Handicapping Committee consisted of Mr. Jacob Pentz, of Shooting and Fishing; Mr. Edward Banks, at that time of FOREST AND STREAM; Mr. Will K. Park, of Sporting Life; and Mr. Elmer E. Shaner. Mr. Banks subse-quently accepted the office of secretary with the American E. C. & Schultze Powder Co., and thereupon withdrew from the com-mittee. The handicapping was done by the remaining members of it.

THE MANAGER.

As mentioned hereinbefore, the different special parts of the tournament were in the charge of expert men. The trapping, the scoring, the squad hustling, the cashier's department, etc., were duties set apart from all other duties. The manner of working all the departments to produce a harmonious whole was no less important than the perfect working of every subdivision, and had its own peculiar requirements and interest in the great tournament.

The general management was in charge of Mr. Elmer E. Shaner, of Pittsburg, and the mention of his name is quite enough to tell that it was managed with perfect skill and unflinching at-tention from start to finish. The organizing and conduct of the tournament was a standard to aspire to as being a model.

Mr. Shaner's portrait is published elsewhere in these columns.

THE REFEREES AND SCORERS.

At No. 1 set of traps was the veteran in trap matters, Mr. Jacob Pentz, who made the official declaration of "lost" and "dead," and passed on all other points pertaining to the office of re-feree. The scorer at No. 1 was Mr. J. von Enimons.

No. 2 set of traps was in like manner refereed by Mr. Harold Wallack, and the scoring was done thereat by Mr. George W. Squier.

No. 3 set was arbitrated by Mr. Edward Taylor, the ballistic expert of the Laffin & Rand Powder Co.; and Mr. H. Taylor, his son, did the scoring.

The duties of the referees and scorers were most exacting, the most constant attention being necessary to observe every detail and avoid error.

THE CASHIER'S OFFICE.

Messrs. B. H. Norton and A. Meyerhoff, both of New York, and both expert men in such matters, had charge of the fi-nancial end of the tournament, and they managed with skill and expedition the receiving and paying out of moneys appertaining to it.

COMPILER OF SCORES.

This important office was in charge of Mr. Edward Banks, Secretary of the American E. C. & Schultze Powder Co., and he was assisted by Messrs. John D. Regan, of Brooklyn, and J. K. Starr, of Philadelphia. In this department was an excep-tionally high degree of talent necessary, inasmuch as to conduct it properly a thorough knowledge of every detail of the whole tournament was necessary. The utmost accuracy and expedition were indispensable conditions in keeping the scores fully com-plete and correct, so that the tournament might proceed without interruption, as a halt in the office of compiler of scores would bring the whole affair to a standstill. In addition an official record of the tournament was kept, and a number of manifold copies made for the use of the press, both daily and weekly.

The shooting was done in squads of twenty-five men. The three scorers at the traps had the same list, and after the last of the twenty-five had shot the three scores were hurried to the compiler of scores, who copied them onto a complete sheet, on which the misses were written with a coarse blue pencil mark, so that all the misses could be seen at a glance. The moment that a squad list was received by the compiler of scores a new squad list, already made up, was immediately sent out to the scorers, and the shooting continued with hardly a break in it.

To avoid unnecessary loss of time to the competition and un-necessary expense to the contestants, one condition in the dif-ferent events was that a contestant should retire after he had lost a certain number of birds, there then being hardly a possi-bility at such juncture that he could win. This also the com-pliers kept check on, and after a contestant had missed the specified number of birds his name was crossed from the list sent out to the scorers, and thus his name not being on the list such contestant was not called up again. A close scrutiny of every squad list was necessary when it was returned, to note whether any one had missed the disqualifying number.

With three sets of traps working, there was hardly an unoc-cupied moment for any one in the office of the compiler of scores. With the system used, a very close tab could be kept on the shooters.

So perfectly was the office of compiler of scores conducted that but a few minutes were required to settle up each event after it was finished. Rebates were made out for birds not shot at, as the men dropped out of the competition, and orders on the cashier for the prize money were ready for the winners soon after an event was ended.

Mr. Banks was also the press agent.

THE SQUAD HUSTLER.

This important duty was performed by Mr. W. J. McCrickart, a duty by no means similar to a saunter through flower-be-spangled fields on a June morning. On him devolved the re-sponsibility of keeping the men in readiness, so that there would always be a man ready to start in at No. 1 trap the moment the shooter had fired and left it. The shooters were numbered from 1 to 207, each one bearing a placard on his back on which was his number in large figures which could be easily distinguished even by those who were watching from the windows; and also in smaller figures was painted the contestant's handicap in yards, the latter being of special service to the referees as it enabled them to see at a glance the handicap of each shooter as he walked to the score, thus avoiding all chances of error in that respect. The numbers on the shooters' backs corresponded to the numbers placed before their names on the score sheets, thus materially assisting the scorers in identifying each shooter who shot out of turn; and the programmes, sold on the grounds, also contained a list of the shooters, their numbers and handicaps, making the whole easily understood by the spectators. On see-ing the number of a shooter the spectator had but to turn to the programme, find the number in the list, and there was the name and address followed the number. At No. 1 trap Mr. Elmer E. Shaner, the manager, stationed himself most of the time, and his clear, resonant voice could be heard calling off the numbers of the shooters who were to shoot or get ready, while the answering calls of McCrickart within the building, calling the same numbers, denoted that it was a most exacting task to keep the wheels moving.

THE RETRIEVERS.

There were nine dogs provided to retrieve the birds, three to each set of traps. Most were setters. Some of the dogs per-formed first-rate, but they became greatly fatigued in the after-noon of each day, and then they would work in a slovenly way or quit. Then it was necessary to have the birds gathered by boys, and at such times there was a perceptible slowing up in the progress of the tournament. Retrieving is very laborious work for a dog, and when it is considered that several thousand birds were killed in the three days, and that each bird denotes a run for a retriever, minus a few hundred gathered in by boys, it is no cause for wonder that the dogs at times lost interest in the work or refused to do it. They demonstrated in a conclusive manner that they are invaluable as assistants in speedily conduct-ing a tournament, and enough of them to do the retrieving throughout the tournament would make a material difference in the time consumed in running it. Several of the dogs showed a most finished schooling in the accomplishment, bringing in the birds promptly, tenderly and to hand, delivering them in a cor-rect and finished manner.

THE GROUNDS.

As shown by the plan of the grounds, the sets of traps with

their 50yd. boundary were set in the clover-leaf style, a plan of which is given elsewhere. The reader should bear in mind that the little circles are 100yds. across, and that all parts of the plan are on a corresponding scale. Roomy platforms surround the club house, making good footing whether the weather is wet or dry. The club house itself is a two-story building with a wing at each end, which were set apart specially for the use of the shooters; from one, the east room, the shooters walked out to No. 1 set of traps, and when they completed the round of the traps, shooting each three shots, they could walk straight into the wing opposite No. 3 set of traps.

The glass sides of the wings, facing as they did the traps at Nos. 1 and 2, afforded every opportunity to witness the shooting comfortably from under cover besides being a convenient gun room and waiting place for the shooters until their turn came to shoot. The main building is two stories, the first floor having places set apart for the compiler of scores, the cashier's office, and the daily press, direct wires to any part of the country being available to the latter. The upper floor during the noon hours was

PLAN OF GROUNDS.

used as a restaurant, meals being served for 50 cents. At other times it was at the service of the visitors, and as it had windows facing on all three sets of traps it was well occupied much of the time, the bird's-eye view being better than any other.

THE BIRDS AND THE TRAPPING.

The birds were an excellent lot, and were furnished by Mr. Louis C. Kistner, of Baltimore, Md. Messrs. Daly & Chanfrau secured 7,000 from him in one lot, and on them the Grand American Handicap was shot.

An underground passage ran from No. 1 trap to No. 5 at each set of traps, with an ample passageway at each end for the passing in of full crates and the removal of the empty ones. The trapper remained in the underground passage. He filled the empty traps from below, only an instant of time being needed to place the bird in the trap; thus they were refilled in the next moment after the gun was fired.

The number of birds shot each day, etc., will be found in the notes appended to this report.

The force provided at each trap by Messrs. Daly and Chan-frau was one trap-puller; one trapper, the latter being in evidence but little, as he was in the underground passage under the traps most of the time; one ball boy, whose duty it was to bowl wooden balls toward such birds as refused to fly; one bird boy, who took charge of the birds after they were retrieved, smoothed them out and laid them out on wire racks to cool out, preparatory to mar-keting them; and last, but not least, a man who had charge of the retrievers, three of which were provided at each trap. Thus equipped, the trap was pulled instantly when the shooter called pull; the trap was refilled the moment the shooter had shot; the dead bird was retrieved quickly by the retrievers; and the bird boy did the rest. In this respect it may be mentioned that the retrievers from overwork quit several times, and boys were used instead, at which times there was a perceptible slow-ing up in the progress of the tournament.

The absence of wind was against the safety of the birds. They flew too steady and true. Arrayed against such skill as faced the traps at Elkwood, it was exceedingly difficult for a bird to get hard, however strong or swift it might be, as most of the birds were killed very close to the traps.

FROM DISTANT PARTS.

By far the greatest number which came in a body were the Western visitors, who numbered forty-nine in all, and came by way of Niagara Falls in two special cars. All enjoyed the grand scenery of the trip. A quartet of musicians added much to the entertainment of the party en route. Most of the members of the Western party, not all, wore sweaters with the legend "Western" in big letters on the breast, so that they were quite distinguishable from the other shooters present. Among them were some ex-cellent shots, and at the end of the third day it looked very much as if the Western party could nearly call the cup theirs. In the party were shooters from Illinois, Iowa, Minnesota, Wis-consin, Nebraska, Arkansas, Indiana and South Dakota. More generally speaking, 132 were from the East, 51 from the West, 16 from the South, and 2 from Canada. Among the ladies present were Mesdames H. P. Collins, E. S. Rice, C. P. Richards, C. W. Carson, L. Shaw, W. B. Kibbey, M. F. Lindsley (Wanda), W. P. Shattuck, and others whose names I did not learn. The Chicago party stayed at the Norwood, at Branchport, and the other shoot-ers were quartered in the hotels at Long Branch or at Elkwood Inn, at Elkwood Park.

TUESDAY, THE FIRST DAY.

The weather was raw as to temperature, with a cold, drizzling rain falling and a touch of fog in the air, which, with a sky darkly overcast, made unfavorable conditions. There also was a very poor light. In the midday hours there were a few weak signs of clearing up, but they soon disappeared, and in its closing hours of the afternoon a slow, steady rain fell till near night-fall. Nevertheless some very good shooting was done, as the scores appended herewith will show.

The birds were very reluctant to take wing, most of them preferring to sit still till the rolling ball frightened them and forced them to fly. A stiffish wind was blowing, though not strong enough to add materially to the difficulties of the shoot-ing.

THE ELKWOOD PARK INTRODUCTORY AND NITRO POWDER HANDICAP.

There were two events shot on this day, the conditions of which were as follows:

The Elkwood Park Introductory was at 7 birds, \$5 entrance, birds extra, handicaps 25 to 33yds. The division was 50, 30 and 20—high guns—not class shooting. Ties in this event did not shoot off, but divided. There were 35 ties, which divided \$445, each one receiving \$12.70.

The Nitro Powder Handicap was at 15 birds, \$10 entrance, birds extra, handicaps 25 to 33yds. The number of moneys into which the purse was divided was determined by the number of entries received, and the 130 entries came under the following provision: 81 to 100 entries and over, 20 moneys, 14, 12, 9, 8, 7½, 6½, 6, 5, 4, 3, 3, 2, 2, 2, 2, 2 per cent., the provision con-templating two places for each 10 entries or fraction thereof up to 100, in 15-bird events. Of the 130 entries, 24 killed straight, di-viding \$1,300, which was \$54.15 to each. The shooting began at 10 o'clock. The first event was finished shortly before noon, and the second was begun soon thereafter.

The scores are given below in double column, and the reader can thereby see at a glance what each contestant did in both events:

WEDNESDAY, SECOND DAY.

The weather was cloudy, but was not unfavorable for good work with the gun; as the light was good, and there was but little wind blowing, what there was coming mostly from the west, though veering about that point north and south quite a bit at times. The birds flew better than they did on the day previous, though oftentimes needing a great deal of urging by the ball boy before they would accept the opportunity to take wing. Once on the wing, however, many of them proved to be able flyers, and as a whole they were quite a good lot. Occasionally a vigorous swift flyer would spring from the traps and speed a few yards away before the shooter could catch aim, and the second barrel seemed many times to have little effect when the first failed to kill. Yet there were many spectacular kills made on swift birds, some very close to the boundary line. Still it was not a difficult matter for most of the contestants to kill their birds close to the traps. A few of the birds showed astonishing vitality in carrying away loads of shot over the boundary, there to die or fall victims to the skirmishers,

THE GRAND AMERICAN HANDICAP.

This was the great event of the tournament, the club house and grounds being well filled with participants and visitors, and interest throughout the day was kept up at the highest pitch. Quite a percentage of the visitors were ladies, and they manifested as keen an interest in the contest as did the sterner sex. A peculiar feature of the shoot was the massing of the crowd at No. 1 trap when it came the turn of Mrs. Shattuck, Brewer and Gilbert to shoot, and the trooping of the whole crowd after them from No. 1 to No. 2, thence to No. 3, then dividing up again about equally at all three traps. This gave an occasional spectacular flavoring to the shoot, and testified as to whom the public considered as being the stars of the tournament. As to the behavior of all, the spirit of entire fairness was with shooters and spectators alike, quiet prevailing when the shooters went to the score, and generous applause being bestowed on excellent shots regardless of whether the shooter was of great fame or not. Of the 197 contestants one was a lady, Mrs. W. P. Shattuck, of Minneapolis, whose husband also shot in the race.

It is a difficult matter to estimate the number of people who were present, but the gate receipts amounted to about \$140. The admission fee was 50 cents, but there were a great number who

were present on complimentary tickets. Shooters and all, there were probably about 600 or 700 present.

At the end of the third round there were 136 straight scores. There were 90 straight scores at the end of the sixth round; at the end of the ninth, 61; at the end of the 12th, 38; at the end of the 15th, 31. At the end of the 18th round there were 21 straight, but 117 shooters still in the race.

Brewer was particularly unfortunate in the ninth round, getting a fast left driver from No. 1 trap, hitting it hard with his first barrel, yet only staggering it a trifle for an instant, then with his second again hitting it hard; yet still it went on a few yards before dropping to the ground. The bird then to all appearance was dead. The dog dashed forward to retrieve, but just before he reached it took wing, flew outside and against the window where was the office of the compilers of scores, and there dropped dead. He missed his 17th, and his chances were gone. There were others also who had hard luck.

Nine rounds were shot off completely on this day, and 100 contestants, that is, three squads, completed their 10th, 11th and 12th rounds, when the shooting for the day ended. The conditions of the trophy were: 25 live birds, handicaps ranging from 25 to 33vds., 50vds. boundary, with a dead line at the 33vds. mark, \$1,500 divided among the three highest guns—\$600 to first, \$500 to second, and \$400 to third. All money in the purse in excess of \$1,500 was divided among high guns other than the three first. The number of parts into which the surplus money was divided was determined by the number of entries received. Entrance money \$25; \$1,500 guaranteed by the Interstate Association, and all surplus added. In addition to first money, the winner received a sterling silver trophy, presented by the Interstate Association.

There was a misunderstanding on the part of a number of the contestants as to the division of the money in the Grand American Handicap, the great difference between the amount received by those who killed 25 and those who killed 24 seeming to be out of ratio, and the difference between the 24s and 23s was still

GRAND AMERICAN HANDICAP TROPHY:

Won by E. D. Fulford, March 25.

Photograph by Forest and Stream.

more pronounced. But the surplus added to the first high guns was further than the management contemplated, inasmuch as such an exceedingly high number of contestants was not anticipated, as the following official division, announced in the programme, will show:

"Should there be more than 60 and not exceeding 170 entries, all money in the purse in excess of the \$1,500 will be divided 13, 11, 9, 7½, 7, 6, 5½, 5, 5, 4, 3, 3, 3, 2, 2, 2, 2, 2, 2 and 2 per cent. to the 4th, 5th, 6th, 7th, 8th, 9th, 10th, 11th, 12th, 13th, 14th, 15th, 16th, 17th, 18th, 19th, 20th, 21st, 22d, 23d, 24th and 25th highest guns. Should there be more than 170 entries, all surplus over and above \$4,250—that is, 170 entries at \$25 each—will be divided into ten equal parts, and added to the different amounts due the first ten high guns. Briefly summarizing the foregoing, it will be noted that the purse will be divided in accordance with the number of entries received, the three high guns receiving respectively \$600, \$500 and \$400. By this division two places are created for every ten entries over sixty. It is not possible for fourth money to exceed third, and the moneys would seem divided in such manner as to be just to all. For instance: If there are 70 entries, fourth gun would be entitled to \$150, while fifth gun would receive \$100. If 100 entries, fourth gun would receive \$250, and the eleventh gun \$50. If 146 entries—the number last year—fourth gun would get \$322.50, and the twenty-first gun \$43. It should be remembered that the Grand American Handicap is not class shooting, and high guns will win."

There were 37 entries over the 170, which made a surplus of \$925, and added materially to the value of the straights.

THURSDAY, THIRD DAY.

The wind had changed from the west wind of the day before to an east wind, though it was so light that it made little if any addition to the difficulty of shooting the birds. The sky was overcast, yet the light was good. The birds were flying better than they did on previous days, taking wing more freely without the forcing process of the ball boy. There were a few light showers in the afternoon.

The number of spectators was much less than on the previous day, yet there was no relaxation of interest. At the end of the eighteenth round Manager Shaner announced that all who had missed three or more would be retired from the Handicap, with the privilege of continuing if there was a chance later to win. The shooting then went on toward a conclusion much more rapidly, and as the strain of the finish began to tell, many others dropped out on a miss. On this day all the sweepstake part of the Handicap was decided. There remained the trophy, however, and the shooting off of the ties to determine the winner of it was postponed till the next day, although there seemed to be quite time enough to finish it on Thursday, the Handicap having ended shortly before 4 o'clock. The nine who killed straight won \$412.16. The twenty-two who killed 24 won \$61.85 each.

There were many astonishing kills, some very close to the boundary line, some very difficult owing to erratic flights of the birds.

But how the birds flew and what the contestants did are given in the scores given herewith, for they tell the whole story of who shot, the handicap of each, what trap the bird left, what flight it took, whether the contestant used one or two barrels, and whether he missed or killed, with his total performance in kills as a conclusion.

THE SCORE.

Transcribe tune—Copyright, 1898, by Forest and Stream Publishing Co.

[illegible]

TABLE OF GUNS, LOADS, ETC.

J. A. H. DRESSEL.
President Interstate Association.

As above mentioned, Patten drew a corker from No. 1, and then there were four..

Bender was shooting carefully and with great judgment, taking his shots quickly or slowly, as the exigencies required, but his 11th, seemingly not a difficult one, was lost, and then there were three.

Jim Jones was shooting as one who would not be denied the cup. He centered his birds in fine shape, but his 14th managed to carry the lead out of bounds, and then there were two.

The interest now had become intense. The shooting was watched with an earnestness which ignored all else. Some great second barrel kills had been made, and the quality of the contest was high enough to satisfy the most critical. Each contestant had in turn been applauded after each successful effort, and a miss was received in sympathetic silence. There was no voice of exultation over the defeat of any one. No fairer treatment was possible, and in this connection it may be said that the same good fellowship and equity obtained throughout the tournament.

From the 15th bird onward to the 22d G. W. Loomis, of Omaha, and E. D. Fulford, of Utica, alternated at the traps, each killing with rare judgment and skillful execution, till it seemed to be ordained that they would go on killing birds all day with about the same ease and certainty that a rooster picks up corn, but Loomis' 23d bird went over the boundary, and then there was one.

E. D. Fulford was the man. There then was a surging of the crowd toward the gentle and quiet victor—he appeared suddenly above the heads of the crowd, and was carried bodily into the casino. Then in a few minutes he was taken out on the platform. Men were shaking hands with him right and left, and other hands were reaching to him on all sides, but he could not shake them all; he had but two hands, a number which did not tally with the hands extended around him.

Then he was taken in hand, while Mr. Elmer E. Shaner in behalf of the Association turned over the beautiful silver trophy to him, a gem work of art, intrinsically valuable in itself, but more on account of the honors of which it was emblematic, and which it would commemorate. And then when the trophy was his by virtue of his skill and by actual possession the crowd must have a speech from him, so he was raised up, was this quiet, nervy and gentle man from Utica, and he must needs speak. He told in a few words how many years he had longed and tried for such honors, and how happy he felt at having won them at last, and how he thanked his friends—that is everyone present, for everyone was his friend—for the kindly good will manifested; and having said this he stepped down, whereupon three mighty cheers and a tiger were given for E. D. Fulford, after which he tried for some minutes to shake a dozen or so of hands, all offered at once. Then for souvenirs he had to give out many samples of the shells he used, and write his autograph upon them, and submit to being photographed, and after the great first enthusiastic tumult was over, there were smaller ones to meet till at length it all subsided to a quiet, pervading gladness.

It is safe to say that there never was a more popular win. It would be to no purpose to attempt to tell of Mr. Fulford's doings at the trap in the past. Where trap-shooting is known Fulford is known. He has been in many great contests in the past, his greatest previous performance being in matches with Jack Brewer in 1891, killing 100 birds straight in one match and 99 out of 100 in another. But he always shot well, and any one who may have doubted his nerve would doubt no more could such have seen the grand finish of the greatest trap-shooting event of America.

The closing event has been described as a great contest between the East and the West. Such is a silly attempt to force a sectional importance to it. No sectional interest whatever was involved, and had Mr. Loomis won, it would have been simply the victory of a gentleman over his fellow gentleman in a contest. It was a meeting of gentlemen, not of provincials.

The finishing struggle was well worthy of the great event. The closeness, skillfulness, nervy persistence and punctilious fairness of it were up to the standard of the most exacting.

Every year each Handicap has surpassed its predecessor, but the one of 1898 will probably stand many year before it is broken. But as to that, Quien sabe?

JOHN L. LEQUIN.
Secretary-Treasurer Interstate Association.

DEAD OUT OF BOUNDS.

E. D. Fulford's win was a most thoroughly popular one. For several years E. D. has tried hard to get into the front rank at the Grand American Handicap, and this year, by means of a magnificent run of 48 straight, he has achieved his desire, and has captured the handsome silver trophy offered by the Interstate Association to the winner in 1898. He also received \$412.65 as his share of the nine first moneys, so his trip to Elkwood Park this year was not without success in the financial line, let alone the honor of beating out 196 other shooters. He shot a Remington gun and Schultze powder in factory-loaded U. M. C. trap shells.

Messrs. Parker Bros., of Meriden, Conn., also gave a trophy to the winner this year. The souvenir was in the shape of a solid gold label button of Tiffany's best and most artistic manufacture. In the center was a bluerock pigeon in enamel, and around the rim was the inscription: "Winner of the Grand American Handicap, 1898." On the reverse side was an inscription stating that the button was donated by Messrs. Parker Bros. The choice of this souvenir reflects considerable credit on the Meriden gun firm.

George W. Loomis, the runner-up in the Grand American, hails from Omaha, Neb., and is a notable member of the tribe of "Indians," who have made themselves famous by their skill with the shotgun. Loomis' title is "Chief No-Talk," sawing wood in preference to oratory being his chief characteristic when at a shooting match, or elsewhere, for the matter of that. He shot magnificently, and made some splendid kills, fully deserving all the congratulations bestowed upon him by Indians, friendly and hostile. In honor of his good showing on this occasion the chiefs of his tribe will hold a pow-wow, and change his title from "No-Talk" to "Heap-Shoot." The pow-wow will probably be held at Clear Lake, Ia., next August, during the "wolf shoot." He shot a Parker gun, Schultze powder and factory-loaded trap shells.

"Jim Jones," the modest sobriquet under which Mr. Junius H. Davis, of the Riverton Gun Club, of Philadelphia, hides his identity, shot very strongly from the 27yds. mark. In the miss-and-out for the cup on Friday morning he ran 13 straight before losing a bird, and thus earned the honorable position of third in the Grand American Handicap of 1898.

U. F. Bender, a young shooter from the city of New York, was the fourth man this year. Bender scored many a hard driver, and earned several hearty rounds of applause by his skill and coolness. The calm, collected manner in which he stepped to the score and grassed bird after bird in the miss-and-out gives promise of many another hot race in which he will be a factor. He lost a bird in the 11th round that it was no disgrace for anybody to have missed.

"Walters," or rather "Wally" Patten, of Pleasure Bay, N. J., shot a race that made him hosts of new friends and admirers. On the morning of the shoot-off, as on the two days of the Grand American Handicap, Mr. Patten had scores of local rooters who made themselves heard as he stopped his bird in each successive round, until he struck a snag in the 10th round of the shoot-off, and retired with a total of 34 straight as his record in the great event of 1898. Out of all the southpaw shooters entered in the event Mr. Patten was the only one to survive until the shoot-off.

T. P. Laffin, a Western man, was the solitary representative of the unformed contingent from the West who managed to survive the 25th round of the Handicap. In the shoot-off Mr. Laffin showed excellent judgment on some good hard birds that he drew, but he got no further than the 5th round, gaining a record of 31 straight in the race for chief honors. Mr. Laffin's first barrel is a most deadly one, and he is undoubtedly an antagonist worthy of the reputation of many better known men. This was his first visit to Elkwood Park, and the first time he has shot in the Grand American. It is to be hoped the entry list for 1899 may find him among the entries.

Rolla O. Heikes, "the daddy o' them all," scored his 25 straight in fine style, and took part in the division of the first nine moneys in conjunction with eight others who made clean scores. He was looked upon as a most dangerous antagonist in the miss-and-out for the cup, but the fourth round was fatal to his chances. In that round he drew a good driver that was well centered with the first shell, being knocked apparently stone dead to the ground; almost before it struck the ground Rolla's second shell was pumped at it, but was not in the right place; the bird, mortally wounded, struck the ground with great force, then rose a foot or so from the ground, and made for the boundary, just managing to clear the wire fence before dropping dead. A moment's delay with that second shell might have made the result of the shoot-off somewhat different, but—who can tell?

Billy Wagner and Jim Elliott never got any further than the first round of the miss-and-out. Elliott's bird was not a particularly hard one, but Jim's bad luck with his first bird in any match is proverbial, and this shoot-off proved no exception to the rule. Wagner's bird was a nasty towerer that went off to the fence on the right like a black duck. Wagner's eyes are none of the strongest, and the glare of the sun on his spectacles may have had something to do with his undershooting the bird. Popular as Mr. Wagner is with shooters of every class, he received sympathy enough to help to heal any regrets he may have felt at dropping out of the race so early in the game.

We never remember to have seen so much enthusiasm and genuine interest displayed in any shoot as was manifested at Elkwood Park on Friday morning. Every shot was applauded more or less loudly, according to the quality of the bird killed. Misses were received with a silence that was all the more impressive when compared with the uproar that greeted some particularly good kill. So far as we were able to observe, there was not the slightest sectionalism shown when it came down to a finish between the West and the East, viz., Loomis, of Omaha, Neb., and Fulford, of Utica, N. Y. The cheers for Loomis when he scored bird after bird were every bit as hearty as those that fell to the lot of the Utica man. The shoot-off was a fitting close to the pleasant and most successful shoot ever held by the Interstate Association.

Exclusive of the 94 birds trapped in the shoot-off for the cup on Friday morning, 4,122 birds, not counting "no birds" were required to complete the Grand American Handicap. On Tuesday 983 pigeons were trapped in the Elkwood Park Introductory, a 7-bird race, with 89 entries; 1,414 pigeons were trapped in the Nitro Powder Handicap on the same day, the event being at 15. birds, with 130 entries. Thus a total of 6,519 pigeons were trapped on the three days of the meeting, an average of over 700 birds a day for each set of traps. Shooting commenced each day at 10 A. M., and was over about 5:30 P. M. on Tuesday and Wednesday, and at 4:30 P. M. on Thursday. With 89 entries in the Elkwood Park Introductory, 130 in the Nitro Powder Handicap, and 197 shooters in the Grand American Handicap, the above figures on the trapping show that the management had things running very smoothly indeed. During part of the second day, too, the retrieving had to be done by boys, the dogs playing out after the gruelling they had received on the previous day owing to the heavy rain that fell all day.

Of the three days of the meeting Wednesday alone was anything like a pleasant one. The attendance on that day showed just what might have been looked for in the shape of a crowd had

IRBY BENNETT.
Vice-President and Chairman of Executive and Tournament Committees, Interstate Association.

the weather been really spring-like instead of resembling days that characterize the month of November. On Wednesday the sprinkling of ladies among the hundreds of male spectators gave the Casino and its grounds a very taking appearance, the spring toilets being especially attractive.

The three sets of traps at Elkwood Park show totally different features from each other. On No. 1 set of traps the ground slopes gradually from the shooter; he shoots, in fact, slightly down hill. On No. 2 the slope of the ground is from right to left, right quarterers climbing the rise, while left quarterers from No. 1 trap slip off down hill at an alarming rate when a northwest wind is blowing. On No. 3 it is a case of shooting rather uphill. Each of these peculiarities had their effect on different men, and consequently many different opinions were expressed as to the relative "hardness" of the three sets of traps. The following figures will, therefore, be read with interest by those who took part in the great event: On Wednesday 87 birds were scored lost on No. 1 set, 105 on No. 2, and 103 on No. 3. On Thursday, up to and including the 24th round of the Grand American Handicap, 86 birds were lost at No. 1 set of traps, 84 at No. 2, 87 at No. 3. The totals for the two days were: 173 at No. 1, 189 at No. 2, and 190 at No. 3. As on these two days 4,122 birds were shot at, the percentage of kills was just 86.6 per cent, a remarkably high average considering the number of shooters engaged in the contest. In the 25th round shot on No. 1 set of traps, 13 of the 85 shooters left in the race lost their last birds.

The birds were an excellent lot, but were handicapped very severely by the absence of wind to aid them. They were just the birds on which to make a score, starting freely and going off without as many twists and turns as would have been the case had there been the same gale of wind blowing at Elkwood Park that favored the birds on the last day in 1897.

We made arrangements for a photograph of Mr. E. D. Fulford, taken with his Remington C. E. gun (one, by the way, of the \$95 list), and also taken with the Grand American Handicap trophy, all of which would have been very apropos to the occasion, but the photograph failed to arrive, so we had to use the portrait of him which we publish in these columns.

The entries which forfeited were Messrs. J. G. Messner, J. K. Dodd, L. T. Duryea, John Barker, H. Harrison, H. C. M., J. N. Crossland, J. J. Sumpter, Jr., T. P. Latham and Dr. Nesmer.

Clearview Gun Club.

PHILADELPHIA, March 19.—The scores made by members of the Clearview Gun Club at their second monthly practice shoot today. Most of us are "greenhorns" at the traps, but on looking over the scores I think "we will grow."

All targets were thrown at unknown angles from unknown traps:

H. G. MILLER.

ELMER E. SHANER.
Manager Interstate Association.

THOMAS W. MORFEY, PATERSON, N. J.
Winner Grand American Handicap, 1894.

Pigeon Shooting at Memphis.

LITTLE ROCK, Ark., March 18.—In order to create more interest in its contests the club has recently purchased a fine gold medal, which is to be shot for until some member of the club wins it three times. The conditions to be 25 live birds, handicap rise, otherwise A. S. A. rules.

The first contest for the emblem took place March 9, and brought about a spirited race, resulting in a tie between Allen and Poston. This, however, remained undecided, as Poston was unable to remain and shoot it off.

The weather was propitious and the birds were an excellent lot. The shooters too were in fine form, as none of those who shot through scored less than 20. The two high men really killed all their birds, as each lost one dead out of bounds.

SECOND CONTEST.

March 14.—The second contest for the club medal came off today. The weather in the morning was gloomy and threatening, though in the afternoon it brightened up some, and a fair wind sprung up, which made it altogether a very good day. The attendance was rather light, but no doubt the weather conditions were responsible for this.

Tom Divine is the possessor of a new 16ga. Parker, and thereby hangs a tale which accounts for the 25 straight he placed to his credit. Tom was evidently in rare form, as with the exception of Dr. Saunders, Jr., none could approach his score. Notwithstanding that the pick of the shooting strength of the club took part in the race.

The tie of the previous contest between Poston and Allen was also decided in this race, resulting in a win for Allen. Thus so far it is any one's medal. The birds again were a good lot, as not one failed to take wing at once.

CHANGE OF DATES AT ST. LOUIS.

Mr. J. A. Corray, manager of Dupont Shooting Park, writes me

THOMAS A. MARSHALL, KEITHSBURG, ILL.
Winner Grand American Handicap, 1897.

under date of March 15 that he has decided to change the date of his amateur tournament to April 18 to 20, in place of 7 to 9. He further adds that there will be \$300 added money at this tournament and that he anticipates a large attendance, as he expects the local shooters to turn out in good numbers. There are more than enough trap-shooters in the city of St. Louis to make the tournament a success, so it now remains to be seen if they will turn out when they have none of the crackerjacks to contend with. Manager Corray is also catering to the popular cry of amateurs only.

March 13.—A few of the locals were out at Dupont's Park trying their hand at the targets. Hirshey was in good form, and ran up some great scores, making one run of 46 and another of 35, while in the six 25-bird events he got three straights. Kling also shot well making a run of 24 straight.

Events:	1	2	3	4	5	6	Events:	1	2	3	4	5	6

AT GALENA, KANS.

March 16.—W. W. McIlhany, of this place defeated W. E. Morgan, of Joplin, Mo., here in a match for the Patton medal. The contest was at 25 live birds, of which McIlhany scored 23 with one dead out of bounds, while Morgan got 22. This is the first defeat that Morgan has sustained in some time, while he has defeated nearly all the best shots in this vicinity.

PAUL R. LITZKE.

Parmelee Challenges Gilbert.

We understand on the best authority that Frank S. Parmelee, of Omaha, Neb., has issued a challenge to Fred Gilbert, of Spirit Lake, Ia., for the Du Pont trophy now held by Gilbert. The money has been deposited in the hands of the Du Pont Co. at Wilmington, Del., and Gilbert will name place and date for the shoot in the near future. In all likelihood the match will be shot at Watson's Park, Chicago.

Interstate at Macon, Ga.

PITTSBURG, Pa.—Editor *Forest and Stream*: Mr. F. C. Etheridge, secretary of the Macon Gun Club, informs me that the Southeastern Passenger Association, has granted a rate of one and one-third fare, on the certificate plan, for the Interstate Association tourna-

bird might have been a high-plumaged coot (*Fulica americana*). What about the feet? Were they webbed or lobed? Were the legs long or short?

PUBLISHERS' DEPARTMENT.

Old Point Comfort, Richmond and Washington.

SIX-DAY TOUR VIA PENNSYLVANIA RAILROAD.

The last of the present series of personally-conducted tours to Old Point Comfort, Richmond, and Washington via the Pennsylvania Railroad will leave New York and Philadelphia on Thursday, April 7.

Tickets, including transportation, meals en route in both directions, transfers of passengers and baggage, hotel accommodations at Old Point Comfort, Richmond, and Washington, and carriage ride about Richmond—in fact, every necessary expense for a period of six days—will be sold at rate of \$35 from New York, Brooklyn and Newark; \$34 from Trenton; \$32.50 from Philadelphia, and proportionate rates from other stations.

OLD POINT COMFORT ONLY.

Tickets to Old Point Comfort only, including one and three-fourths days' board at that place, and good to return direct by regular trains within six days, will be sold in connection with this tour at rate of \$16 from New York; \$15 from Trenton; \$14 from Philadelphia, and proportionate rates from other points. At a slight additional expense tourists can extend the trip to Virginia Beach, with accommodations at the Princess Anne Hotel. For itineraries and full information apply to Ticket Agents; Tourist Agent, 1196 Broadway, New York; 789 Broad street, Newark, N. J.; or Geo. W. Boyd, Assistant General Passenger Agent, Broad Street Station, Philadelphia.—Adv.

A Remington Rifle for Nitros.

The Remington Arms Co. tell us that in response to inquiries for a small-bore Remington adapted to smokeless powder cartridges they have supplied the No. 5 Remington rifle. The barrels, frame and lock mechanism are constructed of selected material, especially designed to resist the enormous strain developed by the use of modern high explosives. They say, "We believe this rifle will meet the growing demand for a light well-balanced weapon of simple mechanism and great penetration, adapted to any climate. The No. 5 Remington rifle will be adapted to the .30-30, the .30 Government and the 7mm. cartridges, and will be listed at \$18."

Together with the marked tendency toward the small caliber rifle has occurred a less noticeable trend toward the small-bore gun. To meet this demand among sportsmen the Remington Co. have included a 16-gauge in both their hammer and hammerless styles.

R. A. WELCH, PHILADELPHIA.
Winner of Grand American Handicap, 1893.

ment to be held at Macon, Ga., April 13, 14 and 15. This applies to points south of the Ohio and Potomac and east of the Mississippi rivers. Shooters will pay full fare going, securing a certificate from their agent which, when signed by Mr. Etheridge, will entitle them to return for one-third fare.

ELMER E. SHANER, Manager.

Answers to Correspondents.

No notice taken of anonymous communications.

New York.—Will you please tell us whether there is a fine and how much for shooting wild bald-headed eagle in New York State? Ans. The eagle is classed among those wild birds which as not given an open season are protected at all times. See Sec. 178 of the law as given in the Game Laws in Brief.

H. C., Brooklyn.—I understand there is a State hatchery in New York State which supplies young trout to brook owners free. Would you please inform me where said hatchery is, as I wish to obtain some young trout? Ans. The Fish Commission supplies fish to public waters only. You may purchase trout for stocking from the hatcheries advertised in *FOREST AND STREAM*.

W. L. M., Dillingsville, Pa.—I have been invited by several land-owners of the State of Maryland to hunt. Under these invitations would I as a non-resident be compelled to pay a license? Ans. The Game Laws in Brief specifies several counties in which the non-resident license fee is not exacted when one shoots by invitation of land-owners. They are Anne Arundel, Baltimore, Carroll, Harford, Kent, Prince George. Some counties do not exact a fee at all.

C. D. B.—If I should build a lake on my farm within my boundaries do I have complete control of the waters, or has the State? If I should have my lake stocked with fish by the State could I prevent persons from fishing on it without my permission? Ans. You would have under the trespass law exclusive right of fishing in your pond; no one could fish therein without your permission. You would be bound by the fish laws as to times and modes of fishing.

H. G. M., Germantown, Pa.—On March 23, when I was on the meadows along the Delaware, below Philadelphia, I had the luck to bring down a bird of the duck family, the identity of which I am in doubt. I wish to mount it and so appeal to you for its proper name. As nearly as I can give, this is a description of it. Head is small, and velvety black; neck slender and black; body gray black, shading to lighter color underneath; tail on under side and as far as vent white; the bill is shaped like that of the coot family, and is creamy white in color; legs and feet are light olive green; eyes red brown. Should think the bird would have weighed a pound and a half. I will be very much obliged if you or some other of my brother readers of the *FOREST AND STREAM* will help me out. Ans. Your description is rather vague, but from reading it over it would seem that your

SIX MONTHS, \$2.

NEW YORK, SATURDAY, APRIL 9, 1898.

VOL. L.—No. 15.
No. 346 BROADWAY, NEW YORK.

The FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. The editors invite communications on the subjects to which its pages are devoted. Anonymous communications will not be regarded. While it is intended to give wide latitude in discussion of current topics, the editors are not responsible for the views of correspondents.

Subscriptions may begin at any time. Terms: For single copies, \$4 per year, \$2 for six months. For club rates and full particulars respecting subscriptions, see prospectus on page iv.

A SUGGESTION TO MAINE GUIDES.

THE Maine system of licensed guides requires that before a person may engage in the business of guiding he shall register his name, age and residence with the Fish Commissioners, and procure from them a certificate "setting forth in substance that he is deemed suitable to act as a guide either for inland fishing or forest hunting, or both, as the case may be." The fee for registration and the certificate is one dollar.

No examination is required to determine whether the applicant possesses any of the qualifications which might be deemed essential to his fitness for the work of guiding. The veriest greenhorn, if he send in his application and the dollar with it, receives a license which on the face of it puts him on an equality with the most skilled and competent guide in the State. This is recognized as a serious defect in the operation of the law. It creates a number of ready-made guides who have no fitness for the work.

When the sportsman comes to Maine for the first time, having had no acquaintance with the guides of the section visited, he assumes that every man wearing the official badge issued by the State authorities is a good guide, and thus the ignorant and incompetent stand on a level with one who is a real guide. The injustice involved here is not only to the sportsman who is deceived into employing an unfit man, but extends also to the capable guide who is in this way deprived of employment by his licensed competitor. Merit is obliged to contend against artificial conditions.

Almost everywhere throughout Maine this criticism of the guide license system is heard; and a general sentiment prevails that the licensing of a guide should mean something more than the mere fact that he has paid a dollar for a badge. The possession of the license certificate should carry with it a guarantee that the person holding it is a good canoe man, a good woodsman, an experienced hunter or fisherman, a capable guide.

The Maine guides hold in their own hands, however, the power to put in operation just such a system as that of the State would be if it were modified to insure the desired results. They may by association and combination weed out the unfit individuals and practically confine the employment of guides by sportsmen to such men as are of known ability and character. The guides themselves can do this, and do it much more effectually than it could be accomplished by any machinery likely to be devised by the State.

There are already in Maine several associations of guides, as the one at Rangeley and another at Moosehead. Let these several associations prescribe as conditions of membership that an applicant shall possess such guide qualifications as may be agreed upon. Let each association determine that no member shall be received into its rolls who is not in every respect equipped to maintain the recognized standard of character and ability which should belong to a Maine guide. Let each association appoint a special committee on membership, the committee to consist of three or five members, so that no one individual need bear the responsibility of rejecting an applicant; and make sure that those on the committee shall be experienced men, themselves among the best guides and those most fitted to determine the character of a candidate. It would rarely happen that a person seeking admission to such an association would not be thoroughly well known to the members; they would be familiar with his record; their determination of his merits would be something more than the mere acceptance of a dollar.

When once such a system was in working order the desired result would be attained. The mere fact that an individual had been admitted to membership in a guides' association would carry with it the assurance that he was a good guide, of recognized ability, of deserving merit, and worthy of confidence. The badge of the

association would have a meaning very different from that which now attaches to the State badge.

The rest would quickly and naturally follow. Membership in the guide association would come to be recognized by visiting sportsmen as an essential qualification by any guide he proposed to engage. Association members would be given precedence. The sportsman would look for the guide association badge. The State badge unaccompanied by that of the association would count for little or nothing. The very fact that a guide did not wear the association badge would be presumptively against him.

It might be feared that the system here outlined would under certain circumstances be developed into machinery of injustice, that individuals might be discriminated against unjustly; but any such tendency would, we believe, correct itself. The success of the association would depend upon the honesty of its management in enrolling only good men, and on the other hand it could not afford to have any considerable number of good men outside of its membership. The greatest usefulness to all concerned would be assured by making the association truly representative of all the competent guiding ability of the country covered by it.

We submit these suggestions to the persons interested for their consideration. Are the purposes sought to be attained desirable ones? And may they be secured in the way here outlined?

We would be glad to have the subject considered by the guides of Maine. They constitute a class which is to-day larger and more important than ever before in the history of the State, and which will grow in consequence as the game interests develop. The Maine guides even now have game and fish protection very largely in their control; and they are exercising that control in an enlightened and intelligent manner; more enlightened and more intelligent to-day than ever before. Whatever adds to the esprit de corps of the men of the Maine woods will make for the advantage of her wilderness resources.

SNAP SHOTS.

It was recorded in these columns last week that, acting under orders from his political boss, and in opposition to his own expressed convictions as to the merits of the case, President Clausen, of the New York Park Board, had demanded the resignation of Dr. Tarleton H. Bean, the Superintendent of the Battery Park Aquarium. Dr. Bean refused to resign; and under the law which forbids the removal without cause of a veteran of the war, he could not be put out of the office. The next step taken by the Department of Parks in their purpose to get rid of an efficient man was to abolish the office; and by a detail of Park police forcibly to take possession. Dr. Bean is quoted as saying:

"Attorney-General Hancock wrote to Albert D. Shaw, Department Commander of the Grand Army of the Republic," he said, "that 'a veteran may not be removed by the abolition of his office unless the position is abolished in good faith and not for the purpose of removing the incumbent. The courts have decided that no sophistries or technicalities can be invoked to evade the law.'"

"Now I know," he continued, "that the office of Superintendent of the Aquarium is not to be abolished. Its name may be changed, but not the duties to any great extent. As a matter of fact, my successor has already been appointed, although he has not taken the oath of office yet. I knew even before Mr. Clausen wrote complaining of the Aquarium and asking my resignation that my place had been promised to Mr. Croker's friend Col. James E. Jones."

This is from the nature of the case an outrageous assault upon public interests. Here is a great institution belonging to the people, involving in its maintenance an annual expenditure of \$40,000, ministering to the entertainment and instruction of more than a million visitors a year, and requiring for successful conduct and highest usefulness that its management shall be the most competent attainable. When the Aquarium was put into Dr. Bean's control those conditions were met. How admirably fitted he was to manage the institution his record has demonstrated. Under his control the collections have grown to be the most extensive and most admirable in the world. The Aquarium was justly a subject of pride to all intelligent persons who were cognizant of its development and successful management. That under these conditions the institution should be made political spoil is an unspeakable public disgrace.

A shot from a foreign warship landed in the ancient and historic structure which is now the Aquarium would

be less of a calamity and less of an outrage than the act of plunderers who have thus confiscated the Aquarium. The cannon shot would be among the fortunes of war, and in due time retaliation would be had; but for this plundering by public enemies in times of peace we shall wait long for redress or any serious thought of redress by any considerable portion of the community. The American people are so used to being robbed by politicians that they accept each new outrage with complacency, and submit to it as a matter of course.

Is the hare, or cottontail rabbit, properly to be considered a game animal, and as such to have the benefit of protection? If we look through the record as given in the Game Laws in Brief, the answer is decidedly in the negative. Of all the States, only seven give the rabbit a close season; and in three others protection which formerly prevailed has this year been removed. Ohio has just legislated the rabbit out of the game law; New York has followed suit, save as to Long Island; and a bill now in the Governor's hands does as much for New Jersey. The drift of opinion then is toward rejecting the rabbit's claim to be accounted a game species. Molly Cottontail is an outlaw.

Naturally there are differences of opinion. The youngster counts the rabbit game, whether it be the prize of his figure-4 trap, or fall before his gun; and the man who hunts hares with beagles will stoutly contend that his favorite should have recognition in the statute. On the other hand, the average bird shooter considers the hare a nuisance, and the gardener and fruit grower detest the creature for its forays on vegetables and its girdling of fruit trees. One plausible argument for classing the rabbits as vermin is found in the fact that when so regarded they make out to shift for themselves and to survive in the land with that tenacity which is so characteristic of all species ranked as vermin. Weeds, both vegetable and animal, persist and thrive and make head against the ineffective opposition of human devices. To-day the hare is as abundant as formerly in sections where no laws have intervened save those of nature for its protection.

Dr. B. Harry Warren has resigned his position as State Zoölogist of Pennsylvania for this reason, as set forth in his letter of resignation to the Secretary of Agriculture: "As my attitude seems to be at variance with what Gov. Hastings desires, and as I believe he should be surrounded with officials who will be in full accord with his political views, I to-day sever my official connection with your department."

It appears further that the State Zoölogist's attitude at variance with the desires of the Governor has to do with the support of certain political county factions. What bearing the broils of contending local politicians have on the scientific investigations of birds' stomachs and the study of field mice and other vermin does not appear at first blush; but the two are in actual practice closely linked together. Politics rule in this case, as they do in the United States Fish Commission, in the New York Aquarium control, and in the appointment of game wardens and fish protectors generally throughout the country.

The project of imposing a license fee on non-resident sportsmen was considered by the New Jersey Legislature this year, but the bill failed to meet approval. The system proposed called for the payment of \$2 for the privilege of shooting. The measure was put into shape by State Game Protector, Charles A. Shriner; but Mr. Shriner's personal convictions were, we understand, against the plan. It will be remembered that New Jersey formerly had a license system under which private citizens when leagued as gun clubs had authority to exact such a tax as they might see fit from non-residents. The system was an unwarrantable and vicious delegation of the lawmaking power to individuals, contrary to all constitutional principles; and in operation it developed sundry ingenious schemes of blackmail by which certain New Jersey rascals profited.

The Boston exposition has already made its influence felt in determining the character of the New York show to be given next March. The managers tell us that while it is yet too early to go into details, the show in Madison Square Garden in 1899 will be strictly a sportsmen's show, in which trade interests will be given a secondary position.

The Sportsman Tourist.

A Summer Love.

THE summer flew, full fragrant breath, on golden wings
O'er hill and dale, o'er town and field, o'er land and sea;
She greeted all created things with fervent kiss
And all, responding, thrilled with joy; so fair was she.

Her eyes had azure tint, her locks a golden sheen;
Her rosy cheeks against her ruby lips turn pale.
And blooming trailing vines held 'round her liliesome form
Light folds of gossamer woof, a flowing, clinging veil.

Four moons have waned since last I met the lovely maid,
Where Oswegatchie's amber floods lave rocky shore,
And spreading branch of pine and beach and balsam tree
Give shade to fragrant couch, where oft I dreamt before.

Oh, summer fair! I've loved thee three score years and more;
And yet thy heart remaineth young and fresh and warm;
'Though loved by countless throngs, thou never brokest faith
With me; I'll bare my heart and own thy potent charm!

The maid ne'er uttered word, but spoke by sign and sound
A language eloquent and easily understood
By one whose open eyes and ears and hungry heart
Found in such summer idleness the needed food.

She hummed and droned with beetle, bee and hummingbird,
Or laughed a purling laugh athwart the waterfall;
Or, when the king of storms smote down proud forest trees,
She sobbed and shrieked and wept; her love embraced them all.

She mocked my startled gaze, when suddenly a trout
Or muskrat splashed around, close by my resting place;
And when at deer or grouse I aimed with fishing rod
She smiled, but chided me with frowning, angry face.

At sunrise summer marshaled forth her full-voiced choir
To grateful hymns of praise and joyous symphonies;
But when the night-pall fell she lured the drowsy world
To sleep by rocking, rhythmic waves and pine branch lullabies.

At last the parting came, as partings ever come,
Filled with regrets and vows, some tears, withal some pain,
My summer love went south and I to busy town;
Yet, in my dreams, 'midst snows, fair summer comes again.

SYRACUSE.

ERNST HELD.

Ghosts.

I STOPPED upon a causeway. It was on the last day of October, and on the one side was a cattail swamp with the fluff of the mace-heads already tufting out and ready for flight. On the other lay a little pond lined with yellow-leaved birches. I leaned upon the rail and looked down into the calm water. The air was still, and now and then a leaf detached itself and zigzagged downward, while from the depths another seemed to zigzag upward, until the twain kissed at the surface and became one.

We all know the feeling, the thoughts, that come to us at such a time and place. A group of faces was mistily distinct—faces of old playmates. Here was one, fair-haired, alert—she died in 1872. Another, ruddy-cheeked, handsome, with the dark hair and blue eyes of the Norman strain—he died in '93. Another yet, tall, dark and winsome, always with a pleasant word, never with a sharp one—she passed away in '97. Yet they were here, with others of the old, old little clique in academy days.

The white clouds drifted past in reflections on the shallow bottom. The little net of dead branches, some feet down, was suspended as in mid-air, motionless, lifeless, and there was no life about it nor between the surface and the ripple marks in the sands below. Nothing moved or showed that it possessed the power of moving, and yet, half way between earth and air, appeared a small turtle, as suddenly as ever a figure flashed on the screen of a stereopticon. It did not "come." It simply was created between the shutting and the opening of an eye, and was there. Reason declared that it had been there all the time—a good ten minutes; and yet the eye must have been looking through and through it all that time, in that event, without seeing, and reason soon divined the cause. Across its back were wavy white lines that matched well the ripple marks on the bottom, until gradually it had swung round athwart them; and then, and not until then, did the eye above begin to receive the impression of something to observe.

The turtle thought it was time to move, and slowly clawed its way to the surface. Its black nose was thrust above it for half an inch with a sigh of content, and a gulp; its hindfeet were stretched out broad and deep behind. Then it began to swing as though hung on gimbals, toward the perpendicular, with the forefeet as the pivot. The arc of the swing was about 30°, and the reverse was effected by a dipping of the head. For full twenty swings it played the pendulum as though enjoying it to the full, its little black eyes ever watchful nevertheless, as the motion caused it to revolve. Then it drew in its head and started slowly downward toward some branches.

One could not help but wonder why those feet were not in rhythm. A frog gives a strong stroke with both rear feet at once with all its power flung into it and all instantly available. Only now and then, when rising or progressing slowly, does it use them alternately. If that turtle could be trained to strike out all four webs at once, to what speed might it not attain, I mused.

Then in the space below me another ghost sprang into being. Right among the branches at which I had been gazing with eyes that did not see there floated a half-pound pickerel; and I had thought that in all these years I had learned to know one when I looked at it! Yet there it was, and evidently had been there all the time. Doubtless a fin now and then quivered a hair's breadth and kept the balance, but with closest watching I could not see it move. To any but a country eye the fish might well be a lifeless stake. Even the mottled back was dust-colored, like the wood around it. The harmony was perfect.

Then came a disturber. Slowly, in its lumbering way, without intent to disturb, the turtle came wandering

thither. It glided up and down among the branches aimlessly, yawing about with each stroke, until it yawned the other way with the next one, yet hitting a fairly straight and happy medium for its general course. It drew near the lair of my pickerel, yet seemed not to see him; but the little pike was not so innocent. Silently it hung in mid-water, but there was something of watchfulness in its poise, felt rather than seen. It waited until the last second, when the turtle was fairly in touching distance; then there was a tremble in the water—merely that—just a sudden bit of indistinctness in the outlines of things seen, that ceased as swiftly and lasted but for the quiver of an eyelash. Yet in that time the fish was gone. It was blotted out of vision as completely as though resolved into water; and where it had been the little turtle was, scrambling frantically to escape from the scene of such a start, each leglet working as furiously and as independently as though run by a separate steam engine whose engineer was on a strike, and whose substitute was not on speaking terms with the ones at the throttle valves of the other three. Then an errant zephyr flashed across the water, and it all was blotted out; visions, dreams and thoughts of life that was, and I mounted my wheel and went onward through the dead leaves of the last day of October, and toward the sunset.

JOHN PRESTON TRUE.

The Old Muzzleloader.

I HAVE a very good fowling piece of modern manufacture, and sometimes I have used it with pleasure. Indeed I in no way fail to appreciate its practical advantages over the old muzzleloader. Yes, I also know the advantages of the smokeless powder and more subdued report, and am not out of true with these new days, though to-day I am seventy-five years old.

But I cannot help going every now and then into the attic to take down from its rusted hooks my faithful old muzzleloader that is so behind the times. It is an old friend, and has grown old with me, and with me is now beyond work. I have had opportunities to sell it, but not for worlds would I let it go.

Nothing extra of a gun at its best. Only a single barrel, small bore, light weight fowling piece, but true as a line within its range. That was not long, just about right for partridge, woodcock and gray squirrels. I have pursued the fox, and once in a while have brought one to terms with it. It numbers among its victims a lynx, and on two occasions made bold attempts on the life of a wolf.

It is fully as old as myself, being one of the first that appeared as an improvement upon the flint lock.

I have always had a great love for the woods and the gun, and in my youth have tramped many miles through dark forests and tangled underbrush in pursuit of a few partridges. And I would that now, just for one brief, bright Indian summer day, I might be transported to the old Maine woods that surrounded the home of my boyhood and follow again the old paths, frosty and cold in the early morning, dry and warm in the afternoon, fascinated by the whistle and whir of the grouse.

You could not shoot many birds in those days, and we needed no game laws, for nature took good care of the supply. If you brought home a brace of partridges, a half dozen woodcock, a gray squirrel or two, it was a good day's work; but how insignificant it would be to-day.

You see one could not shoot many birds, for it took time to load. He must carefully measure his powder and weigh his shot. Then the powder must be rammed hard. A wad of oakum served to hold it in place; then followed the shot; they must be somewhat loose, so we were taught in those days, held in place by another wad of oakum. Then came the priming! How lovingly one held the gun in the hollow of his arm, and raising the hammer examined the tube; then put the cap on—the bright cap, so suggestive of force—and carefully let the hammer down! Ah, the boys of these days are deprived of all that. And I am in earnest when I say it is a deprivation. To shoot, then carefully load, then go and pick up the game, never hurried, never frenzied, while round you was the smell of the old black powder! That was a good part of the enjoyment. Time is surely an element in pleasure.

Now things are done too quick. You shoot, and while you are turning round you reload, and shoot again. The loading is a mere mechanical process; it involves no thought. Your charge is made for you, and all that needs to be done is to snap the gun over your knee, put the shells in, give it a jerk, and there it is, all ready for another attack; a minute and a half or so is time enough for the whole process.

Yes, one now loses the peculiar mental pleasure of measuring his powder in the hollow of his hand, and carefully weighing the shot.

Then, one must kill so much in these days! Not less than a dozen partridges, two or three dozen woodcock, as many gray squirrels, or he is a poor gunner.

Why don't I use the old muzzleloader when I go gunning now? Ah, the times have changed! Why don't neighbor Jones use the old hand scythe and rake? He would like to. Can I be ten minutes loading, when my boy loads in two? Can I go athwart the spirit of the times, even in the little gunning I do alone? Certainly not. So I have put the old muzzleloader away in the attic, now and then to look at; and in moods when memories of former days come thronging upon me I go and take it down, and together we two old friends dream of the hunting days that are no more.

Yes, I keep the old powder horn, and the shot bag, both my own make, and a box of caps, the last I bought. Sometimes I turn out the powder, just to see if my hand has forgot its cunning. I weigh again the charge of shot. How good it feels in the palm!

"You never heard of drying your powder?" On great occasions, the annual shooting match, or some fox hunt, I used to put my powder into the frying-pan and set it over the fire. You only had to guard against a stray spark or two, and you could dry it quite as easily as so much sawdust. The powder of those days was not highly explosive as powder. Sometimes, when you wanted to shoot quick your cap would snap, and you would take the gun down, and then hearing a commotion within almost get it back to your shoulder before it would be off. That

was another feature one had to watch for. It was a trade to handle the muzzleloader with ease, and succeed in killing game. Now any boy, even a girl, can handle the gun.

"Was it all gunning in those lost days? Is there no other interesting memory clinging to the old muzzleloader in the attic than the tramping through the Maine woods, and shooting of a few partridges?" Yes, there is more. There are fond recollections, tender memories connected with it.

In the store where I used to buy my powder was a little girl. You "knew there was a girl connected with it?" She was a slight, golden-haired child, when I began to buy powder. I was about sixteen then. She may have been twelve, but so small that I thought of her only as a child. Her name was Mamie. Sometimes Mamie was left alone in the store, and then, if I wanted powder I must show her what it was, and where to find it, and even pour it out for her. Somehow I took to going there after my powder always at the time when I knew her uncle was out. I really liked to pour out that powder for Mamie.

Well, I poured out powder every two or three weeks, during the hunting season, from September to March—there were no game laws then—for several years. The years seem to go slow to boys, but they went fast, those I spent in weighing powder—I bought small quantities, and used large quantities. There were several reasons for that: I did not have much money to spend for powder, and I feel quite sure I was very much interested in that golden-curved clerk.

One day, after some three years—I was nineteen, Mamie fifteen—the powder did not run well; had got damp or something else, and we had to coax it, and thus our hands came together, and her hair more than once fell on my shoulder. I guess, after all, as I now study the event in cool blood, I guess the powder was much the same as ever, and that we were the ones with which something was the matter.

"What was the matter with us?" I never could tell, but we blushed and looked supremely conscious—I did not think of it like that then; it is an afterthought. I stood holding the keg of powder, and could not have told for a world what for. Mamie tried to wrap the powder in the coarse brown paper, but somehow could not.

"Why didn't we talk?" Couldn't think of a thing to say. Not a thought in either head. I tried to help her with the bundle, but only took hold of her hand; and then somehow, I never knew how, I found my arm around her waist, and her arms around my neck, and those soft curls on my shoulder, and those large, dreamy blue eyes pouring their depths of soul into mine. Then we awoke.

"That's the way you use the time when I'm gone, is it?" came the shrill voice of Mamie's aunt.

"Two culprits?" No culprits that I ever saw looked half so shame-faced as I felt, and Mamie hid her face entirely.

"If you've got your powder, I guess you'd better run home, sonny," was the final advice to me. I took it. What happened to Mamie I never knew. It was harsh enough.

When I ventured after powder next time there was no Mamie, and her uncle poured it out—such black stuff, so damp and worthless, that I got mad and told him I guessed I didn't want it. And he laughed. No, I instantly saw that it was not that commodity I wanted, and the other, the little golden-haired clerk, had been sent away to sea.

Did my wife ever hear that story? Go and ask her.
JOSEPH WOODBURY STROUT.

Just About a Boy.—IX.

WHEN I came home the boy was waiting for me, curled up in a jack-knife attitude, his back against the fence and his broad hat pulled down to shade his eyes while he industriously whittled a stick and chewed one of the pungent pine shavings.

"Gee! Thought you wasn't comin' 't all," he said, as he arose and snapped his knife shut against his trousers leg.

"I'm goin' up river in the mornin', Goin' to nose around where some beaver bin a-workin' up there. Want to kinder figger on how many pelts I c'n corral when fur gits good this fall, yeh know. Want to go 'long?"

"Sure," I answered. "I feel just like taking a trip anyhow."

"All right. Goin' to start early soss to git away fr'm the sun all we can. 'Bout daylight I reckon 'd be a good time. Be ready then, will yeh?"

"Yes," I answered, "I'll meet you at the boat at dawn. Will we take any guns or fishing tackle?"

"Dunno; nuthin' to shoot, but we c'n do some fishin', I reckon. Oh, say, I know—gee! course we can! I got 'bout fifteen or twenty jug lines down at the landin'. 'n' we'll jug back!"

"All right; I don't know anything about jugging, but if you do we'll try it. I'll bring lunch for both of us, then, and meet you in the morning."

"All right; so long!" said the boy, as he started home. "Say," he called back, "be sure and be down t' th' river by daylight?"

"Yes."

When the gray dawn came we were afloat on the silent river. The little canoe scarcely made a ripple on the glassy surface as we slipped along swiftly as may be, two good, stout paddles urging the little craft forward against the sluggish back water above the dam.

Little curls of vapor seemed to hang like smoke against the water, and curious little, oily, wavy places showed where a sunken snag neared the surface. A home-hurrying muskrat marked a wrinkly patch across the current and dived as we neared him.

Blackbirds chattered among the willows or flew with swift beating wings and trailing tail rudders across the tinted sky.

"Say," said the boy, without turning his head, "this here's a heap the nicest part of a day, ain't it? If it 'd juss stay this way forever I don't reckon Paradise 'd beat it a heap, d'you? Look at them fool blackbirds, fightin' like a couple o' kids over sompin' 'r other! Smell th' trees, huh? Can't smell 'em on'y on still summer mornin's, early, this way, jever nodiss it? Seems like when th' sun comes up it sort o' soaks up th'

smell like, nen it's all gone. I like th' early mornin' better'n any part o' th' day, don't you?"

"I agree with you exactly," I said, and mentally noted that this young savage had a good deal that was poetic about him, in a rough way, and enjoyed and appreciated the beauties—those untellable beauties—of old Dame Nature in her varying moods. It struck me that this likening of the tranquil summer morning to Paradise was a homely expression of enjoyment to the fullest extent, innocent, healthy and satisfied enjoyment that lacked any thought of animal viciousness, and to this day I have never found a more fitting description than his.

In time the sun came up, painting the few clouds with all the tints in nature's color box, and then settled down to the business of warming the world and painting the colors all out again.

The canoe never slacked its even progress, forging ahead under the shadow of the trees until the mist left the water and a cooling breeze rippled the quiet surface into tiny wavelets.

When noon came the boy said we had reached the beaver grounds, and we went ashore.

The boy carefully inspected the cut-off stumps of the willows, looked long and carefully at the flat, webbed tracks in the mud, and hunted "sign" for an hour, while I sat in the shade and smoked, waiting until he should return.

"I reckon they's about nine or ten beaver here that's good fer fur this fall," he said, as he sprawled beside me on the grass.

"They's a pair o' old ones 'n' two er three litters o' kittens o' different sizes, I figger. I'm goin' to have them pelts when frost comes, too, you bet.

"Geel! Less eat. I'm hungrier 'n a bear. Funny how a feller gits so onreasonable hungry knockin' 'round this way, ain't it?" he said, with a smile, as we opened the lunch.

"I got the jugs 'n' a few frogs down there 'n th' canoe, 'n' I reckon we c'n float down with the current 'n' let the jugs do the fishin' 'safternoon, 'n' have some fun too. Got to ketch s'more hoptoads, though, first," he added, as he stowed away the remnant of a sandwich and went for the little tin bucket to get water from the spring near by.

"Say, that's the best drink 't ever was invented, ain't it?" he remarked, as he came back with the bucket brimful of cold and good water from the spring that welled up among the rocks of "Stony Point."

"Seems like white folks want to kill 'erselves drinkin' all kinds o' whisky 'n' beer 'n' stuff like that when they's s'much good water juss runnin' to waste. I can't juss figger such things out myself."

We loafed about in the shade talking and resting for an hour, while the young philosopher tried to "figger out" the problem of humanity just as philosophers have thought and wondered and "figgered" since time began, and like them the boy finally "give it up," and turned to the immediate business of catching frogs for fish bait.

I stretched at length along the grass, lazily watching the swallows flit in and out of the burrows in the bluffs across the river, wondering why these little creatures had been so constructed that they could annihilate distance so easily, while man must plod slowly along up hill and down over the surface of this old world.

The soft lullaby of the wind-tuned trees lulled one to the quietude of mind necessary for building air castles, and soon I was day dreaming there by the quiet river. I saw without seeing. I was there, and yet knew nothing of the surroundings—just thinking.

A big black ant crawled across a bit of sand, exerting every energy to drag a dead grasshopper to his storehouse. A black wasp nervously opened and closed its steely wings, and after inspecting its surroundings vanished.

The midday sun flecked the ground with a network of ever moving shadows, weaving in and out, blending with the flowers and grasses of the bank.

"Say, you goin' to snooze all day? Git a hike on yeh 'n' c'mon. Got to move if we ketch any catties 'safternoon. I got lots o' bait, so less go."

The boy had broken the spell, and soon we were drifting lazily, contentedly along behind a row of corked-up beer bottles and small jugs that floated in "company front" with the current of the prairie river.

Birds flitted in and out among the trees; an occasional squirrel could be seen stretched at length along a gnarled oak limb, just soaking himself full of sunshine—or perhaps he would be nosing about among the fallen leaves on the ground, his tail curled up over his back and waving like a great brown plume.

Turtles basked on the dead snags and plunked off into the water as we floated by. Everything was living and enjoying life in its own peculiar way, and over all was the brilliant blue of the prairie sky, the flood of light from the summer sun, and just enough warmth to make us too lazy to even talk as we drifted on the slow current, following the line of jugs and bottles down the western river.

Suddenly the boy gathered himself together, dipped deep with his paddle, and the canoe began to move swiftly toward one of the jugs that was bobbing, spinning and plowing through the water in circles, as a heavy fish tried vainly to rid himself of the hook.

"Say, gee! that's a Balaam, sure!" said the boy quietly, as we watched the antics of the bobbing jug.

As we neared it the jug sank, and a few moments later reappeared 40ft. away, swirling through the water as the fish towed it along.

"You work her, 'n' I'll git that Balaam," said the boy, as he laid his paddle inboard and got ready for action when we should get within reach of the jug.

I handled the canoe, and in a few moments got alongside, where the boy got hold of the line and began to fight the fish on his own ground.

Several times the broad tail curved up and threw a shower of water over the boy, and several times the boy caught his breath and said "Ugh!" but he hung on, and in the end pulled the big blue-black catfish over the gunwale of the canoe.

"Good un, ain't he?" said the boy, contentedly, as he slipped a string through the fish's gills and hung him overboard.

Soon the jug was rebaited and drifting along with its fellows, and behind the line was the black canoe with its counterfeit reflected upside down in the quiet stream,

drifting, drifting with the slow current, while the boy and I reclined along the bottom and up against the "lazy back" seat, waiting and drifting there in the quiet of the summer afternoon.

EL COMANCHO.

Natural History.

The Chestnut-Sided Warbler.

BY HERMIT.

THURSDAY morning, May 27, 1886, a small bird hopped out of the bushes into my dooryard. The bird was a female chestnut-sided warbler. She was collecting dry grass blades for a nest.

May 27, 1897 the same little bird was in my dooryard engaged as before, collecting nesting material.

Eleven years had been credited to the past for man and bird. The man had not escaped the weight of the added years. Deeper wrinkles and gray hair told the story, but the little bird, strange to tell, was apparently as blithe and young as on that Thursday morning eleven years before.

I provide an abundance of nesting material for all birds that frequent my cabin dooryard. The chestnut-

NEST OF CHESTNUT-SIDED WARBLER.

sided warbler seemed to appreciate my motive and gave me her confidence in return. After the first year I could sit by her nest from the hour the first straw was laid to the day when the young were large enough to take wing and she would go on with her domestic affairs without fear.

During eleven years the bird has constructed thirteen nests. Two nests were robbed by snakes and were replaced. No two of these nests were alike. All were loosely built, and with the exception of the last were saddled on the forks of small bushes. The nest of 1897 was suspended between two shoots of a currant bush about 20in. from the ground. This was a new departure, and led me to have a picture made of the nest. There was a bunch of currants in the way and the bird fastened it to the side of the nest with spiders' web. The currants show in the picture, which I inclose with this paper.

The books inform us that the nest of this warbler is never pensile, but if the nest in my currant bush was not pensile what may we call it? It was fastened at the brim to two upright currant stems without support at the bottom, as the picture shows. The brim was fashioned first. It was composed of straws, shreds of cedar bark and dry grass blades. The same material was fastened to the brim and arranged to cross, thus forming the bottom and sides. The tying material used was spiders' web and silken threads from some cocoon unknown to me. The nest was lined with fine straw and horse hair. All the nests previously made by this bird contained a liberal amount of plant down on the outside. This last nest was nearly wanting in plant down, although a good supply was in the dooryard.

Several years ago the bird saddled into the fork of a bayberry bush a bunch of cotton nearly as large as a base ball, and on this foundation erected a nest.

I have records of four nests, including the last—the one in the currant bush. This 1897 nest was 3½in. in diameter by 2in. in depth inside, and 3½in. outside. The foundation was laid May 27, and the nest was completed June 3. It was then deserted for three days. The first egg was deposited June 6, and thereafter one each day until the 9th, when four eggs made up the set. The fourth egg was pure white; the other three were white with a ring of reddish brown blotches around the larger end.

After the fourth egg was laid the bird remained on the nest nights, but during the daytime for three days spent

the most of the time gadding about. June 20 I found one bird out of the shell and the next day all were out. The young birds are not fed until they are one day old. They are not great feeders like young robins, and the mother bird has an easy task to provide food. The birds grow rapidly. At first the mother can cover her brood while half hid below the brim of the nest, but before the young birds leave the nest she must stand with a foot on each side of the brim.

July 2 the young birds were induced to leave the nest. On that day the mother bird did not feed the young birds, and I think they must have been downright hungry. Later she tempted them with a plump insect, while the male fluttered about with cries of encouragement. Soon one hopped out of the nest on to a twig and was quickly fed. The others took the hint, and all were soon out of the nest. Most birds pursue the same method, and it reminds one of teaching baby how to walk.

My little friend has had two mates since we became acquainted. She was made a widow by a prowling cat during the summer of 1896. The next spring she returned with a second husband. This newcomer resented any familiarity on my part. He seemed to think that I was too inquisitive, and made a great fuss every time he found me near the nest. Frequently my little friend would fly at him and drive him away. She tried to make him understand that I was a welcome guest, but he never took kindly to my presence. In return I thought him most ungrateful, for I had killed one cat and two snakes to protect his family.

My little friend holds my dooryard and immediate vicinity against all other chestnut-sided warblers. If some other bird of the same species starts a nest the little squatter tyrant drives the interloper away. She claims sway over a circle about 200ft. in diameter, with my cabin for a center. Catbirds, towhee buntings and oven birds and two ruffed grouse have nested on this claim, but for eleven years no chestnut-sided warbler has succeeded in pre-empting the claim.

The chestnut-sided warbler is so conspicuously marked that a mere tyro in bird study cannot mistake it for any other member of the warbler family. The bright yellow crown, pure white under parts and chestnut sides of the old birds are marks not to be mistaken. The young birds are yellowish green above and silky white below.

An amusing thing happened here some years ago over a bird of this species. A lady caller, a summer resident, asked me for the name of a bird which often visited a tree over her sitting room window. She claimed that the bird was pure white with red wings. I could not make her understand that there was no such bird in New England. "Seeing is believing," she claimed, and I was invited to investigate for myself. While looking from the sitting room window I saw the bird above my head on a twig. Sure enough he was a white bird with red wings. It was a chestnut-sided warbler. From a distance the effect was enough like a white bird with red wings to deceive any one not well acquainted with bird life. Looking up to the bird the chestnut sides resembled red wings.

I sent the lady into an upper room, where she could look down on her white bird, and she soon returned, and laughingly said, "I always knew that there were two sides to a story, and now I have just learned that there are two sides to a bird."

Ways of Rabbits.

I WOULD like some one versed in the habits of rabbits to give the readers of your valuable paper information as to their intelligence and peculiarities. My daughter has a great fondness for animals of every description, and among her collection has a black cat about a year old, and a rabbit probably about the same age. These two have struck up a strong friendship and romp about the house, chasing one another like kittens. The rabbit is gray and white and quite large. He has very strong prejudices against certain things, such as the fire shovel, which he will take in his mouth and put away from him when it is in his way. He apparently reasons like a dog or cat about things, and shows great intelligence. When he hears the bell ring for meals he hurries to the dining room, and if the door is closed scratches against it to be let in. I used when a boy to have the pink-eyed white rabbit as a pet, but it has always been my impression that they were stupid animals, principally interested in devouring all the green things in the garden. It would be a pleasure to know something about these creatures, and I hope this may strike the eye of an expert in such matters.

New Partridges from Mexico.

THE interesting work done by Mr. E. W. Nelson and his companion in Mexico is sufficiently well known, and the great amount of valuable material which he has brought back is familiar to all scientific men. Among this material are many species of birds new to science, and some of these Mr. Nelson is now describing in the Proceedings of the Biological Society of Washington. One of these papers of especial interest to sportsmen is a revision of the *Dactylortyx*, a group of partridges curiously mixed by earlier writers, the name of one species having been ascribed to figures which now prove to belong to another. Various authors have written about the species of this genus, but with material so limited that their efforts merely made the confusion worse. Mr. Nelson, however, with a more ample series of specimens describes three species and one subspecies of this genus, two of the species being new. These are *D. chiapensis*, collected near San Cristobal, Chiapas, Mexico, and *D. devius*, from San Sebastian, Jalisco, Mexico.

The Linnaean Society of New York.

REGULAR meetings of the society will be held in the American Museum of Natural History on Tuesday evenings, April 12 and 26, at 8 o'clock. April 12, Frank M. Chapman, "Notes on Birds Observed during a Recent Trip to Florida;" April 26, programme to be announced on the special notice sent to members.

WALTER W. GRANGER, Sec'y.

Northern Vermont Notes.

SHELDON, Vt., March 31.—*Editor Forest and Stream:* I send you a few notes first concerning some bird arrivals here this season:

March 9.—Saw first shore lark.
March 10.—Robins reported, but not seen by the writer until the 16th.
March 17.—First bluebird; quite numerous.
March 18.—First song sparrow.
March 23.—Red-wing starling reported seen.
March 25.—First meadowlark.

It is quite possible that along the river and creek bottoms these birds may have arrived some days earlier. The past month has been the most pleasant March ever known in northwestern Vermont, though not so early as the March of 1859.

The writer has traced up the moose before reported as passing through this section last autumn. With the exception of being cut about the legs by the barbed wire fences, it crossed safely back into Canada, where it received a hot reception. In Sutton, P. Q., the first town over the line north of Richford, Vt., one fellow fired nine shots at it, and another habitation three shots, but evidently without effect, as the moose at a good gait entered the woods of Sutton Mountain, headed northward.

Last season three deer were killed on this mountain, and twenty-seven in the vicinity of Mt. Orford.

Last summer a two-year-old cow moose was seen at Brompton Lake, north of Orford Mountain.

The ice is out of our lakes and streams, but no trout fishing is permitted until May 1. STANSTEAD.

Game Bag and Gun.

Duck Shooting in Connecticut.

ONE cold morning in the latter part of November a light carriage, drawn by a medium-sized bay mare, stopped in front of a house in the city of New Haven. "Hello, Will," said I, "here I am at last. Did you think I was never coming?"

"Why, yes, Harry, I did think so; in fact, I had given you up entirely."

"I'm sorry. It was impossible for me to get here any sooner, though. It's quite a job to get so many things together in so short a time. There was the horse to feed and clean, gun, ammunition, grub, extra clothing, jug of cider and other necessary articles to be stored in the carriage in some kind of style. Add to this the time for breakfast, harnessing, and a drive of seven miles; then I think you must acknowledge that I've done pretty well to get here even by 10 o'clock. I tell you what, I've hustled since 5 o'clock."

I had been invited by my friend, Mr. William Barker, to indulge in a duck hunting expedition with him to Sachem's Head. He owns a small summer cottage there, and as he is an ardent lover of duck shooting he keeps the cottage furnished, to a certain extent, all the year round. When he feels like indulging his propensity for his favorite sport he invites some one of his acquaintances to spend a day or so with him at the cottage. A person is always sure of a good time on one of these trips, even should he fail to shoot any ducks.

Sachem's Head is a matter of sixteen miles from the center of New Haven. In the summer time, when the fields and woods are green, the drive is a charming one, and the roads are excellent. Now, however, while the sky was devoid of clouds and the sun shone brightly, the wind howled out of the northwest in a biting manner, and it was impossible to keep comfortable.

We crossed the network of railroad tracks, and numerous drawbridges between New Haven and East Haven, without mishap. I noticed that the horse acted strangely, and called my companion's attention to the fact a number of times. Generally she roared at a good, snappy gait, but now she seemed not to care whether she moved or lay down. In fact, she appeared to prefer to lie down. "I don't understand why she acts that way," I said over and over again.

"Possibly the horse is sick, Harry, and don't feel like moving. Is she subject to a colic?"

"No, not to my knowledge. You know I've only had her a short while, but I never noticed any indications of colic about her."

"Humph! the old animal does act queer, that's a fact."

When we reached the foot of the hill at the southern end of Lake Saltonstall the old mare acted so weak that we wondered if she would be able to draw the carriage to the top of the hill. Before noticing anything strange in her demeanor I had entertained my companion with hair-lifting accounts of the manner in which she had, on two different occasions, taken the bit in her teeth and nearly smashed things to pieces. "That's why I had to get that ring bit for her," said I. "A common one won't hold her."

Will was now enjoying himself hugely at my expense. "Push on the reins," said he, "or she'll smash things all to bits by falling over backward into the carriage."

It was a tedious climb to the top of the hill, and seemed to wear the strength completely out of the horse. My heart beat with compassion for her, and I had come to the conclusion that our trip would have to end at the next farmhouse.

"Thank heaven, we're at the top of the hill at last," said Will, when we had gained that point on our journey. "I believe we'll be compelled to get out and carry the old—" He never finished the sentence, for at that moment something snapped; it was the old mare's teeth as she grabbed the bit. Her ears flopped tight to the back of her head, as though glued there; the carriage shot ahead as if expelled from a catapult; then the landscape commenced to slide to the rear. The old beast not only had the bit, but the carriage as well, and all it contained. We managed to retain possession of the whole of the road, and we needed every foot of it.

"What ails her, Harry? What ails her?"

Will's eyes were nearly bulging from their sockets, and he clung to the side of the carriage seat with the ten-

nacity of grim death. "She's running away, that's all," I gasped.

"Can't you hold her, Harry? Can't you stop her?" His appeal was filled with a yearning that was exceedingly pathetic.

"I'd give \$50 if I only could stop her," I groaned.

The carriage alternately slid from one side of the road to the other. "Whoa, Bell! Whoa! Hi there! Whoa! who-a-p!" No use; the wheels only turned faster. How they managed to hold together was incomprehensible to me. We came to a long curve and the old mare settled down to business in a manner that was agonizingly frightful. She seemed to flatten to twice her length, and appeared not to run, but to fly. Fences and telegraph poles appeared and vanished in kaleidoscopic succession. I sawed and pulled, sawed and pulled, but no use; she had us all right. The bit felt like it would if screwed up in a vise.

We had made half a mile in half a minute (so Will afterward declared), and I could gain no control of the horse whatever. I dared not exert my full strength on the reins for fear they might break. I held the whip in my right hand, and couldn't drop the reins to put it in the whip socket. "Take the whip, Will! Take the whip!" I cried. He misunderstood and grasped one of the reins instead. He exerted his full strength with both hands; the old beast jumped to his side of the road, and the carriage all but upset. "Take the whip! Take the whip—and let the reins alone!" I yelled. He finally comprehended and took the whip from my hand.

To make matters more joyously exhilarating, the harness now began to part, and I surely thought the grand, final climax had arrived. Luck, however, favored us in one respect—the road was nearly straight, and we met no teams. When the hilarious brute had made something over a mile she commenced to lose her wind, and I gradually gained control of her. Much to her regret I stopped her just before reaching the railroad bridge that spans the road on the outskirts of Branford.

When the bewitching old beast finally came to a standstill we got out and enjoyed ourselves hugely repairing damages. The harness had dissolved partnership in a number of places, and the frigid air fairly scorched as we enthusiastically proceeded to mend that busted harness with two old shoestrings. We re-entered the carriage with considerable misgivings, and proceeded on our way. The old mare had fooled us, but she acted greatly dejected when she realized she hadn't killed us. I kept her on the go the rest of the trip, and she roared the remaining eleven miles in less than an hour. Will never mentioned anything more about "pushing on the reins." In fact, we were both anxious, and we felt much relieved as we approached our objective point.

I had bought this mare for my family's especial use, and she had been recommended to me as perfectly safe for a child to drive anywhere. I afterward found that she was a notorious runaway, and that she had broken the leg of one of New Haven's best known liverymen. It seems to me that life imprisonment would be none too harsh a sentence for any person who would recommend such a horse to a buyer as safe when fully aware of the animal's vicious nature.

Will had always lavished enthusiastic praises on the excellence and beauty of Sachem's Head. "It's God's own garden," he had said time and again. As the carriage swung around a curve in the road, and the place suddenly broke to our view, it seemed I had seldom looked upon a sight more pleasing to the eye. I had seen the rows of clean, bright summer cottages many times, but always from the water. They are perched on every available rock, point, and choice spot. Some of their roofs peeped from among a grove of small cedars, which grew back a way from the water's edge. A neat, clean hotel stands on a prominent spot, and commands an excellent view of the Sound in front, and of the hills, woods and valleys to the north.

The waters of the Sound basked radiantly in the rays of the early winter sunshine, and the shores of Long Island stood plainly out to view. That which interested us more than anything else, however, was the sight of numerous flocks of ducks feeding near the shore. They consisted mostly of old squaws and coots, but here and there we noticed an occasional bunch of broadbills.

"Isn't this fine! Just see that bunch of broadbills! By George!—we're in luck. It's too bad to-day is Sunday. Never mind—they'll stay, and we'll have some fun with them to-morrow." Presently he continued: "See, Harry! right among that thick bunch of cedars. Do you see the little cottage? That's my little shanty—the place where we will stay to-night. Isn't it fine! I love that little nest." And it was a cozy little house.

We found quarters for the horse in a nearby barn. After starting a roaring fire in the kitchen stove we got at a good, hot dinner, and the rest of the afternoon we spent in snapping the camera at different objects of interest.

Will decided that we hadn't decoys enough, so when darkness settled over the earth we took a trip across the fields to a farmhouse, and borrowed an extra dozen. We then hurried back to the house and got out our own decoys, dusted them off, fixed the strings by which they are anchored, and got them in some kind of order, so that things would work systematically in the morning. Will set the alarm for 4 in the morning, and we betook ourselves to bed and pleasant dreams.

It seemed I was sound asleep as soon as my head touched the pillow. The next thing I knew my eyes opened with a snap and my ears were filled with the sound of the harsh jangle of the alarm clock. "Heavens! it can't be morning yet," I said, aloud. "Yes it is, and you'd better get up out of that, or you'll get no ducks to-day," said a voice from out the darkness. Will was already stumbling around in his room in a vain endeavor to find a match.

The house was cold and disagreeable at first, but we soon had a good fire going. Then the coffee was started, beans put in the oven to warm, and steak broiled to a turn. "We must eat all the breakfast we can hold," said Will, "for we won't have another chance to fill up until 3 or 4 o'clock."

Just how Will had manipulated that alarm clock he alone knows. When our meal was finished I went out on the veranda and looked for some sign of morning, but there was no sign. I kept going out at regular in-

tervals for over an hour, but always with the same result. The sky was overcast and a few flakes of snow were falling. The surf moaned mournfully on the shore, and a raw, chill wind sighed out of the east. Faulkner's Island Light flashed alternating long and short gleams, and the doleful wail of a steamboat's whistle came at regular intervals over the gloomy waves from the south. Every indication pointed to a favorable day for our business—for such is perfect ducking weather.

After what seemed an age the eastern horizon took on the faintest tinge of gray. This was the signal for us hurriedly to transfer the guns, ammunition and decoys to the beach. When this work was finished the forces of daylight had encroached considerably on the shadowy realms of night.

"We're going to have a dandy day," observed Will, as he viewed the surface of the water just before we shoved the boat off the beach. "Just see the ducks out by Hump Rock! Why, there are thousands of them, and they're not stirring yet. Come, let's move, or we won't get our decoys out until after sunrise."

We slid the boat over the sand and into the water; then we got aboard and started for Hump Rock, black and oval shaped, and seldom submerged even by the highest tides. It lies about a quarter of a mile off shore, and is a favorite stand for duck shooters.

It is cold business setting decoys, as every one knows who has ever been there. In spite of the protection afforded by two pairs of woolen drawers, two pairs of trousers, two woollen undershirts, a heavy outing shirt, vest, heavy sweater and shooting jacket, and a heavy woolen cap, a pair of heavy shoes covered by arctics, and two pairs of mittens, I was none too warm while setting those wooden images. If it is cold setting them it is doubly so taking them up again. Will did the rowing and I set the decoys as he directed.

I hadn't dropped one-half of the wooden lures over the side before the ducks were stirring. They circled all about us and were very bold. Flock after flock swooped down toward the decoys, and many of them came within easy range, but we refrained from firing at them. "Hurry, Harry! hurry!" Will kept repeating. I needed no urging, however, for I was as anxious to commence shooting as he.

Finally the last decoy was dropped over the side, and we took our stations on the rock out of sight of the ducks. We had hardly removed the covers from the cartridge boxes when, "Mark west!" said Will. Looking in that direction, I saw a bunch of old-squaws sweeping down on the decoys with the speed of the wind. We held our fire until they reached the center of the deceptive lures, then we opened on them. Bang! bang! bang! One tumbled out of the air, and two bunches of feathers drifting on the wind showed that some of the others had been hit.

"Mark south!" A bunch of coots were coming from that quarter, and at the same time I noticed another bunch of old-squaws heading toward us from the west. Will tumbled one of the coots in good shape. I only succeeded in winging one of the old-squaws. I chased him with the boat and fusilladed him until I was in a fair way of using up all my ammunition; then I relinquished the chase and returned to the rock.

The sun was now trying to shine, and his rays were gilding the clouds with gold. Wreaths of mist lifted from the crests of the waves and swept along above the surface of the water. Flock after flock of ducks arose from their liquid resting place and winged their way in every direction. We were kept so busy attending to those which came to the decoys that we forgot all about being cold. Some we killed, others we wounded, but the great majority escaped unscathed.

"Mark west—spoonbills. Keep well out of sight, Harry, for they're shy rascals, and we'll have to do our prettiest if we get a shot at them." We hugged the rock close, and had the satisfaction of seeing the bunch coming to the decoys without a swerve. "A pair of those fellows are worth more than all the coots and old-squaws in the Sound," whispered my companion. "Make sure of your aim, and don't fire until you see their eyes."

On they came until within 50 yds. of the decoys, then, to our disgust, they swung, and all but one passed to the north; this one came straight to the decoys. As he discovered the fraud and wheeled to join his companions, Will fired and tumbled him out of the air in fine shape. This shot was by far the best made that day.

A bank of clouds now swept out of the northeast and brought a dash of snow and rain. Coots and old-squaws kept coming, however, and we continued to fusillade them until our ammunition became exhausted. Will remembered that a box of shells had been left at the house, so I volunteered to go after them.

When I returned with the shells I found Will almost in tears from vexation. "While you were gone," said he, "a whole bunch of broadbills settled right among the decoys. Of course I hadn't a shell, and those ducks wouldn't stir until I jumped on top of the rock and yelled like an Indian. I believe they knew I was out of ammunition."

We soon used up the extra shells, then nothing remained for us to do but to get our decoys and go ashore. While taking up the decoys we were much surprised to find how wretchedly we had misjudged distance. We found the nearest decoy to be over 45 yds. away, and that we had fired many shots at fully twice that distance.

After a good, hot dinner we packed our belongings into the carriage, harnessed up the old runaway and set out for home. Before starting, however, we reinforced our leather reins with a good, stout pair of rope ones. We didn't care to repeat our comet-like experience of the day before, so the old mare was kept moving the whole distance to New Haven. I had learned better than to allow her to accumulate any extra steam by favoring her. I am also happy to state that the person of whom I bought her is to-day the happy possessor of her. I persuaded him to relieve me of her the day after I got back from our ducking trip. Should any of FOREST AND STREAM's readers desire this double-jointed, triple-expansion, comet-like piece of horseflesh, I could put them on her trail. I wouldn't, however, for I have no enemies among FOREST AND STREAM's readers that I know of, and I wouldn't have a friend get hold of her for the world.

While old-squaws and coots do not rank high among

the duck shooting fraternity, still when they decoy as well as they did for us that day they afford exceptionally fine sport for those who like to rough it, and who are not afraid of cold weather. Especially is this so in Connecticut, where in these days the choice varieties of ducks seldom come, and in fact where one seldom meets with success even when after old-squaws and coots. We tried them on a three days' trip afterward, but never got a feather.

Our bag counted 14, and we used 125 shells. Eight of the ducks were old-squaws, 5 were coots, and 1 was a broadbill. Through our misjudgment of distance, I am not proud to say, we wounded many more than we killed. Most of these escaped entirely.

In my estimation, making cripples is the great drawback to duck shooting. When the coldest weather comes, and the ducks flock to a warmer climate, it is pitiful indeed to see a poor, wounded cripple, deserted and forlorn, floating on the icy waves. It is sad to know that days, perhaps weeks, of suffering from inflamed, feverish wounds will be its hard lot, until death finally comes to its relief and ends its miserable existence.

WILLIAM H. AVIS.

Hunting Whitetails in Wisconsin.

BY CAREY.

"HELLO, Percy! Bloody hands and tell-tale crimson spots on your clothing! On the first morning's hunt you hang your first deer, and it's the first score of the party," were the words that greeted the youngest member of our club. "Tell us all about it."

"There's not much to tell. The truth is, I ought to have two. I was sneaking about the hemlock knolls northeast of camp, when I spied an object, white-like, and I thought it a rabbit or squirrel. Another glimpse proved it a doe. I drew and shot too quickly, cutting only the hair from her back. Then a shell stuck and saved that deer for some other fellow. Just then a spike buck passed, but stopped to look back, and I gave it to him in the neck."

This was the beginning of a two weeks' hunt had in southwest Taylor county, Wis., opening Nov. 1, 1897, the delights of which were enjoyed by the Badger Nimrods, the major portion of whom hail from the vicinity of La Crosse Wis.

The illustration gives the readers of the *FOREST AND STREAM* a view of our camp, an ideal one for any lover of nature in its loveliest garb.

The reader observes that our home is a primitive log cabin, scoop roof, with but a garden patch about it; but it is a veritable palace for a hunter. A vast sea of forest that tosses, rolls and lifts up its majestic voice as does any other ocean to the wind's touch immerses this little homestead. Giant hemlocks and maples sentinel it, and modest cedars that clasp the entire year in a wreath of green smile upon it; and the men are but a typical lot of stalwart Westerners. Percy is that demure young Hercules to the left of the door—supple, stalwart, and a born woodsman. William Mc. is at the extreme left, and he is the senior of us all, not only in years,

he has few superiors as a deer hunter. There were nine hunters, and ten deer were hung during our stay, all bucks, attesting the wisdom of the law of this State making the open season the first twenty days in November. At this date in most seasons the bucks are astir and the does are hiding.

Herewith is a list of the persons and dates of each capture:

Nov. 1, Percy Mc., a spike buck in the morning.
Nov. 3, William Mc., a fawn buck in the evening.
Nov. 4, George B., a spike buck in evening.
Nov. 5, Billy H., aged buck in morning.
Nov. 5, W. C. G., aged buck in evening.
Nov. 8, Percy Mc., a fawn buck, afternoon.
Nov. 8, W. C. G., aged buck in morning.
Nov. 11, Billy H., spike buck in morning.
Nov. 13, Alex J., aged buck, afternoon.
Nov. 13, Alex J., aged buck, afternoon.

Of these ten, our party of seven killed 7, three killing 2 each, one killing 1 and three scoring a miss. No, not a miss, for both J. K. J. and E. S. fatally wounded one; but the extreme dryness of the season made tracing a wounded deer next to impossible; but this is often the saddest experience of still-hunting deer.

If the readers please, and the editor permits, we will have these hunters tell the story of each capture, following the order of dates above given. These tales of the wood are given just as they were told as we grouped around the stove after the day's hunt was over. A kodak's snap shot at this moment would reveal nine men in all the perfect unreserve of a hunters' camp. Some are prone upon the two double story bunks that nestle in two corners of the room. Others are in a semi-circle around the fire. Blue swirls of smoke rise from pipes and cigars, and good cheer and sweet content brood over all. Percy has told of the first killing.

The veteran, William Mc., said: "S. was with me this evening, and we took a stand not far apart, some two miles northwest. At almost dusk a deer came in view. I waited until I had a bead on its middle, and fired; and as it ran I again shot. Soon S.'s gun spoke, and he called saying he had knocked it down. We went to the spot, but the deer was up and gone. It was too dark to trace it, but after much vain searching we found it the next morning, with but one ball hole, and that through its entrails."

George B. said: "I killed a spike buck last evening when it was so dark I couldn't see a sight. Guess he'd run over me if I hadn't stopped him. I was watching from a high log west of the 'old chopping,' when I saw him skipping and pumping as if in a frolic. In his funny business he came my way, and as I halted him and fired he ran back like a streak. This morning I found him ten rods off, shot square in the breast."

Billy was next: "I was standing on a knoll to the north this morning," said he, "when I saw an old buck strutting along as proud as a turkey cock, and coming almost on a line to me. At the proper time I called a halt, drawing on his shoulder. As the gun spoke he dashed away, but I knew he had his medicine, and found him only a few rods away."

W. C. G. said: "As you know, I've been a setter during this hunt. Elevated logs and stumps have been my

of my dead deer and sat under the shadows of dense hemlocks, watching a runway, when I saw the gleam of horns. Then glimpses of a form were seen as it passed thickly set trees. It would step a few strides, then take a dozen steps to stop again, meanwhile crouching low and stretching its neck to the front. Impatiently I waited for it to reach an opening. As it did so, I said 'stop!' in a quick, sharp voice, my gun already on his breast. In the instant that long, lank thing was transformed. Head aloft, nostrils dilated, every muscle at a tension, he seemed to swell to twice his former size. But the Winchester's voice rang out, and the royal game sank down, struck fairly in the front breast."

On the 11th the entire party joined in a "drive," and although five had shots, and two were badly wounded, one by E. S. and another by Percy, Billy was the lucky one. "I was driving, as you know, and didn't expect to score a hit, but as I came over the last hill I caught sight of a fawn. I could see only his head and neck, but that was a plenty, and when my gun spoke I saw him double up and I knew it was my meat."

On the 13th Alex J. covered himself with that halo of glory that envelops the hunter who wins. He came into camp as we were at dinner, his face aglow. "I've got them this time. One's down and a big buck wounded. I've come for help to track him," he said, as he washed his bloody hands. "This has been a great day with me. Why, I've shot away every shell, and when they were all gone a big doe at which I had sent several of my last shells turned into an open logway and ran straight from me for ten rods or more. If S. and George B. will go with me, that buck is mine. I was in that park west of the old camp when I downed a nice spike buck, my shot striking him through the back. As I came up to him I heard another running just over the slope. By a quick run I came in sight of a big buck and shot twice. On his trail I found blood, and it was while I was tracing him that the doe tempted me to empty my Marlin. Oh, this has been my day."

The boys accompanied him, struck the trail, George B. swinging around in advance to stop him if he broke cover. As they expected, he was yet able to run, but George shot twice, the first cutting hair across his throat and the second breaking his back, and the largest buck killed by our party was laid low.

Wisconsin's fish and game preserves have a national, if not an international, reputation. Many hunters assert that deer are as abundant in northern Wisconsin at this time as they have been for twenty years. Certainly they are yet sufficiently plentiful to satisfy any reasonable demand. This noble game is found north of a line bounded on the south by the main St. Paul line of the C., M. & St. P. Railway, and extending north to Lake Superior, excepting towns and settlements immediately along the lines of railways. All over this large area immense tracts of pine trees have been cut and removed, and in their stead a thick growth of vines, briars and every variety of small trees have sprung up. This gives a covert and fortress unexcelled for protection to this beautiful and wary creature. Added to this, our present excellent law, limiting the killing to two for a person; requiring each deer or part of deer to bear a coupon; requiring all hunters to obtain a license, non-residents having to pay a fee of \$25; with many excellent prohibitions, such as hounding, night shooting, shooting in water, etc., we believe that this State will continue to be for many years one of the first States in the nation as a deer preserve and hunting ground. W. C. GERARD.

The Cuvier Club.

CINCINNATI, O., March 15.—*Editor Forest and Stream:* The Cuvier Club has a royal ambition to extend its field of usefulness; in fact it desires to push ahead and make new conquests. It wants to materially improve every department it has, so as to make the organization of still greater credit to the city.

It especially aims to make it educational to an eminent degree, for the benefit of the public and the public schools. It therefore, among other things, wants many rare additions to its museum, the same to its library, and a more thorough protection to fish and game, both legal and otherwise.

The Cuvier Club was organized some twenty-five years ago, and since then it has so rapidly advanced in the promulgation of its principles that it is now looked upon as a public institution as well as a public necessity, and is really one of the attractions of the city to visitors from abroad.

To show how the principle of protection to fish and game—its leading feature—attracted the attention and support of the public, we have only to look at its membership then and now. Then it had but ten members, all ardent disciples of rod and gun; now it has over 300, and is composed not only of those who love the sports of field and stream, but of those in all walks of life—in fact, the very best representative men of our city.

The causes which led to the success of the club are: The preservation of fish and game from certain annihilation by the thoughtless and mercenary, in the interest of the food supply of future generations, and to afford healthy, pleasure-giving recreation; the collection of a museum of natural history, that shall be the means of education to many and an additional attraction to the city. Although our platform embraces only the above, we find that forest preservation and the propagation of fish and game are so interwoven with it that we are ever ready to give a helping hand to their advancement.

The social organization is of such high character and excellence as to commend itself to every respectable member of the community. While it opens up a pleasant place of resort for the members, it has studiously been kept free from all that can be objectionable to any, with no bar or restaurant attached, no card-playing for any kind of stakes, nothing that demands any expenditure of money beyond the nominal annual dues of \$10; so that a person in most moderate circumstances can enjoy its privileges and feel himself on a level with the wealthiest.

The most prominent feature in its social life is its annual banquet, which in its gastronomic specialty is acknowledged by the daintiest epicures and most notable chefs to be the most recherche game dinner that could

THE CAMP AND THE CAMPERS.

but in successful deer hunting. See his sturdy frame and eagle eye! E. S., an ex-Union soldier, is one of the most enthusiastic and successful hunters in the State. He was too ill to leave the camp except for a few days. Billy Horton stands in the doorway. Every one in all this region knows Billy. He is not only such a cook as can give a razor-edge to any appetite, but he is a hunter and guide of the highest type. To his left is George L. He is a superior shot, but lacks experience as a woodsman, and was not in good health. J. K. J.—does he not look his love of the woods? He and his brother, Alex J., are adepts with both rod and gun, and are in touch with every interest of the craft. The latter does not appear in the picture, being the artist. But for him an expectant world would not have been blest by a sight of these Nimrods. Next in order is W. C. G., also an ex-Union soldier, and a long-time hunter, whose love of nature is innate and inordinate. The last in the circle is Billy's partner, George B. A deer has little chance, running, standing or asleep, if he sights it. With the stealth and endurance of an Indian,

boon companions. On the afternoon of the 5th I was tenderly caressing a lofty log from 3 P. M. until almost 5 P. M., when a deer's body—its middle part—was seen. To shoot it through the center meant a fatal wound, but I might never trace it. I must try breaking its back. At the gun's report the deer dropped, and my aim was true. As I approached I saw it was a buck, and the heroic fellow, though paralyzed from the center of his body backward, tried again and again to charge upon me. A second shot cut short his courage and his life."

Percy's second kill was thus: "I was hunting with Uncle Will along the bottoms of Otter Creek, when I shot at a fawn and knocked it down. It jumped to its feet as I went up to it, and I fired again, but it got out of sight. While I was on its track Uncle, from a high bank, spied it lying in the creek bottom at the edge of the water, and gave it another shot. I found it struck by three balls, any one of which would have killed it in a short time."

On that same morning, the 8th, W. C. G. killed his buck. He said: "I was prowling about in the vicinity

be perfected. A prince of the realm, to put it more boldly, would feel himself honored as a guest at one of these elegant feasts. To see social life as it daily exists in this famous club is to view and admire a picture of pure delight. Here you observe, as you pass its portals of unmeasured pleasure, some of our most prominent citizens engaged in solving many of the perplexing problems of chess, others absorbed in the deep subtleties of fascinating whist, while still others are infinitely diverting themselves in games less taxing to the intellect. A casual glance at the "Turn-over Corner" reveals a coterie of accomplished sportsmen in that mirthful precinct, many of whom have locks as white as the driven snow. They are ever busy reeling off, with fervent enthusiasm, the exciting events of the angle and the hunt, and as occasionally happens their overwrought imaginations carry them into the land of startling romance.

The club museum, which is the work of a generation and is a striking example of the taxidermist's art; is one of the attractive features of the organization. Free to the public, it will well repay a visit from any one who takes an interest in natural history. The large attendance from the scholars of our city schools shows they have appreciated its advantages as a place for study from nature. Our members, and business men generally, cannot find a more interesting and instructive place to which to bring visiting strangers than the museum of the Cuvier Club, nor any which will be more thoroughly enjoyed. Nowhere outside of the Smithsonian Institution at Washington can a larger collection of the character be found, and in its preparation and mounting of the specimens in the exhibit it is not conceded that it is second to any.

The library is a very rare collection of standard works on natural history and field sports, and contains many valuable books that are not elsewhere to be found in the city. There are among them a few musty tomes over 200 years old, but the majority of the volumes are more modern, embracing many in narrative and all that is of interest in ornithology and ichthyology. The sportsman and the lover of nature will here find much to delight and interest them.

The grand and stately building which we occupy is owned by us without a dollar of incumbrance. Its total cost, including the lot, was over \$40,000, and it is an exceedingly ornate and magnificent piece of architecture. Unmistakable research shows that it is the only building in the United States—and the only building of which we know ever erected in any place—which was built only for the purposes of and exclusively by advocates of game and fish protection. It stands to-day alone in the world as the product of that sentiment. It is dedicated to that principle. It is the palpable embodiment of that philanthropy. May the example ever spread and its influence ever expand.

Our ambition does not stop at its present consummation, for it has ever been the dream of the Cuvier to see in the next decade such a rapid and radical increase in membership as will necessitate an edifice double or treble its present size, and a museum overflowing with the rarest collection of birds, fishes and animals. He also looks to see it become a necessary annex to our public schools, with a corps of learned professors exemplifying to many hundreds of their youthful pupils the beauties of ornithology and ichthyology, and that it may become the great Western or Central Mecca of natural history in many respects, and so important to city and State, with its accomplished educators, that it will become as much an authority on that subject as the Smithsonian Institution.

J. B. SCHEIDEMANTLE, Sec'y.
ALEX. STARBUCK, President.

Tennessee Game.

"BROWNSVILLE, Tenn., March 24.—*Editor Forest and Stream:* In return for the information received from other members of our widely scattered family, I hereby report from this immediate section.

"Our open season on birds, Nov. 15 to Feb. 15, was duly observed by the shooting fraternity, and from the first I must say that Bob Whites were scarcer than I ever saw before. We attribute this state of affairs first to the awful drought which prevailed in our section from June to October, which destroyed most of the young, and to disease, something like chicken cholera, which destroyed many of the old birds, which were found dead in the fields. Such as survived sought the canebrakes and woods near water, and there lived out the period of famine, remaining there until the high water drove them to the hills, when to our joy we found there were many more than at first supposed. During the months of November and December we thought them well-nigh exterminated, and had put up our guns, or directed attention to the rabbits, which suffered in a like manner, but during January and February there were sufficient Bob Whites in evidence for very mild sport.

"In the season of 1896-97 my best single day was twenty-eight coveys, thirty-two birds—total for the season 485. One of my gunning companions is Mr. Bumpass, of the Pythian Hotel, whose best day was, I reckon, about twenty-six coveys, forty-two birds, and 515 for the same season. Now compare the record for 1897-98. My best day then was thirteen coveys, fourteen birds; total for the season eighty-six. Mr. Bumpass' best day, twelve coveys, sixteen birds; total for the season about eighty. Singular as it may seem, since the close season, Feb. 15, we have seen better filled coveys than in the open, and hope for them in old-time plenty the coming fall, and that your Western representative may be with us as in time past.

"Of ducks, a few stragglers, poor and outcast apparently, have been seen, and thirty or forty killed during the winter by my friends, where once we feasted fully on their juicy frames. Ring down the curtain.

"Turkeys have been more plentiful than in fifteen years, and now at the beginning of the close season I know of a flock which numbers thirty-eight individuals, as well as several smaller in number. This calls to mind the fact that Mr. Bumpass killed on Tuesday last a four-year-old gobbler, which dressed 20lbs. To-day his sporting friends dined with him, and a feast it was indeed.

"Of deer we have a very few, our wolves are in good fighting trim, and prospering, and foxes on the increase.

"I noted on my last hunt scattered over a space of forty acres some thirty or forty bluebirds, cheerful and full of music as ever, and since then, whenever afield never fail to notice some during the day. All our other songsters are doing well, including his lyric majesty the mockingbird.

"Mr. Cuthbert has domiciled on his plantation a colony of English ring-neck pheasants, which last season bred and seemed perfectly at home in his fields. A pair wandered some five miles from home, and I regret to say the cock was killed by one of my sporting friends, who did not know what it was. When told, he said he had rather lost a bale of cotton, and though not a rich man, he meant every word of it.

"I am in possession of the skin of a white squirrel, which was killed in our county a few days since, an albino undoubtedly, and of the gray family. This is the first white squirrel skin I ever saw, though negroes have always told me there was such a thing, and with them have frequently hunted them. Last year I saw the skin of a white raccoon, also one of five negroes who were in the chase. When the tree was felled and a white coon came out and tackled the dogs, four of the sports, headed by the deacon of the Baptist Church, of that neighborhood, cried: 'Oh, Lawd!' 'Tole you so.' 'De lamb!' 'Less go!' They started home, and hunt no more in those woods. And now, sir, wishing good luck and long life to all our family, I remain BENJ. C. MILES."

P. S.—Apropos of "buck ague," your Western representative sometimes shoots Bob Whites in this section with Dr. W. D. Taylor, a gentleman not calculated to lose his head even at the explosion of a covey of twenty birds concealed in a foot-square tuft of brown sedge—a circumstance calculated to make most men "shaky" all over. Well, one Sunday some two months since, the Doctor and I were driving through a thousand-acre tract of woods, some six miles north of town, and I was relating to him the particulars of a battle I once had with a rattlesnake at that point, when a turkey gobbler crossed the road 20yds. in front of the buggy and joined six others of his peers in a fallen tree top not 20ft. from the road. The Doctor slowed the horses down to nearly a halt, and there for a full minute we eyed each other in mutual surprise—seven big, wild gobblers—the warriest thing that treads the earth, and two mature men, full-blooded sportsmen, too. The Doctor's eyes stood out, his right thumb ran up and down the lines in search of "safety" and trigger. Oblivious of all things apparently, he panted: "They are so pretty! Look at the big one! There are three in line; could get them at one shot; there is aristocracy certain!" And I am of opinion that that cool-headed, self-possessed, well-mannered gentleman had plebeian buck ague! B. C. M.

CHICAGO AND THE WEST.

"249."

CHICAGO, Ill., April 2.—If there is one man before the public eye this week, even in these times when the eyes of the people are upon public men—if there is any public man whose name should be enshrined in grateful remembrance by the people, and more especially by the people of the West, that man is Commissioner Chas. H. Babcock, of Rochester, N. Y., who led the forces which wiped from the statute books of New York the infamous Section 249. The numbers 249 are, or should be, odious in the eyes of every Western sportsman, and every Western man who has an interest in anything beyond a row of figures. Section 249 was the open invitation for unprincipled persons to violate the laws of every Western State, to steal the property of the people of every Western State. Section 249 was graven on the banners of the South Water street horde of Chicago, who have made the second battalion in this army of crime. Boston is the third battalion. It has always been the cry of the Chicago dealers that they should be put upon an equality with the markets of New York; in other words, that they also should be permitted to run a wide-open market the year round. We have succeeded in limiting the commerce in game in this city in some minor degree, and under the administration of the present game warden there has been a gleam of hope that the game laws of this State might at some time be so fully enforced that the game would be absolutely protected. But no one had any idea that the great and lawless market of New York would ever in this generation be limited in the least degree. We have met and "resolved" against Section 249, but we did so with the full belief that the resolutions would come to naught. We have resolved in favor of better laws in the State of Illinois, but this we have done faint-heartedly, and feeling that we could accomplish very little. Mr. Babcock has done more than resolve. He has accomplished. Mr. Babcock and the men who acted with him, and the Governor who approved their action, are men who should be held dear in the eyes of every Western man who goes afield or looks out of a window. Never in the history of sport in this country has the sentiment of intelligent game protection taken such strides as within the past eighteen months, and it may without hesitation be said that no step has at any time been taken comparable in its significance with the repeal of black 249, late of the New York statutes.

There is a lesson of hope and encouragement in this action of the New York Legislature. It reads that the men of Illinois need not despair. It reads that Chicago need not be behind New York. It means that the task here is easier than it has been thought to be. It means that good laws, practical laws, sensible and operative laws, are not only possibilities, but probabilities, in every Western State.

The Goose and the Egg.

The spring flight of ducks is now well scattered over the North, and the general opinion is that the flight was a heavy one, the shooting being best along the Illinois and Mississippi rivers. They have been having heavy shooting on the "deep-water ducks" in Wisconsin, on Lake Poygan, the Butte des Morts, Winneconne, and other famous ducking marshes of that wonderful State. Below here the flight is now pretty well over. At Lake Senachwine and Swan Lake the shooting has been ex-

ceptionally heavy at times, though sometimes the flight would let up, and poor bags were the result. Parties from Savanna, Forest City and other points reported on the whole rather small bags, twenty, thirty or forty. Mr. F. S. Baird, of the law committee of the Illinois State Sportsmen's Association, was out last week with a friend, but they bagged only twenty-one ducks.

At Monmouth, Ill., duck shooting was formerly very good, more especially in the springtime. The following comment from a Monmouth local paper is interesting as showing the difference between the old days and those of the present:

"A few hunters who make a business of it have brought in large numbers of ducks, but ducks have grown so wary that the shooting is poor for the average sportsman, and citizens here who would be glad to buy rarely have an opportunity. It doesn't take a long memory to go back to the day when a duck could hardly be given away here. Their feathers were of some value, but the birds were here by the thousand, and every one who wanted them could have more than he could use. They used to visit the fields and feed for a long-time in marshy places, but now they are hunted with every sort of ingenious device, and fired on from the Gulf to their home in the northern lakes. Even there they are not safe, for we read their nests are robbed to secure material for artificial eggs. The duck is going fast, and it will not be many years until it is gone."

The new Iowa game law prohibits the shooting of ducks or other wild fowl from a blind. Attorney-General Milton Remley has handed down an opinion that this law is good, and that it is the duty of the State authorities to prosecute offenses against this clause as much as violations of the close season. There is no doubt that this clause of the Iowa law, if enforced, would lessen the bags of Iowa ducks. It is, therefore, with some surprise that I note that it was sportsmen of Burlington, Ia., who were first in the field, declining to believe that this section of the law would be sustained. It was the "Burlington sportsmen," according to published accounts, who asked the Attorney-General for a ruling, which it seems has turned out not to their liking. Perhaps not all Burlington sportsmen are in favor of greater laxness instead of greater strictness in the measures looking toward the protection of game. We have been accustomed to the doctrine that the sportsman was a man who believed in giving game every possible chance. Is it, perchance, possibly true that the sportsman may be built of the same clay as the rest of humanity?

Speaking of limiting the means and methods by which ducks may be killed, I venture to predict that ultimately we will see the use both of blinds and decoys prohibited in wildfowl shooting, not only in this State, but in others. This will not be for a long time, not until the birds are still more scarce than they are now. Yet if we could see our way to such a measure now, and if we could put a law on our statute books which would stop all shooting and all selling at Jan. 1, our game would never again be scarce, but would increase from the first day that such a law was enacted and respected. All sportsmen are human, and to be human is of course to be selfish. When it comes to speaking of selfishness, what a tip could be given to the lawmakers of any Western State! Suppose Wisconsin or Minnesota, for instance, should abolish spring shooting and practically abolish non-resident shooting. Either State would within one year be such a game preserve that its citizens might chuckle in glee. It would be worth while to emigrate to such a State as that.

Some Bags.

Among other bags made along the Illinois River within the past two weeks, the following are reported, mostly at Lake Senachwine: George Roll, 37; J. W. Niebert, 32; J. G. Reuter, 36; Frank Edwards, 21; L. J. Kohler, 17; M. E. Wilson, 28; S. A. Goss, 27; A. B. Eaton, 36; Gus Cousins, 47; E. H. Kane, 51; Henry J. Sherman, 31; Dr. Vance Powle, 37; Judge Francis Adams, 18; R. P. McCauley, 47; George W. Brown, 27; T. B. Hanna, 18.

Geese.

It is rarely that we hear of much goose shooting in Illinois or Wisconsin, as the flight of these birds does not cross these States in the old-time numbers. During the past week, however, a great many geese were using the prairie ground below Janesville, Wis., and several very good bags were made under the difficult conditions obtaining. These geese were the Canada honkers. A. J. Gaston, of Beloit, and Alva Russell, of Janesville, killed fifteen geese, six of which weighed 75lbs.

Snipe.

It is generally believed that the flight of jacksnipe is not yet up, but I have reason to think that this is a mistake, although no good bags have yet been made. On the famous strip of marsh at Koutts, Ind., the birds have been heard every night for nearly a week, but they do not stop, as the water is still too high over their favorite feeding ground. It is thought that within the next week the snipe will be in on the Maksawba marsh. I should think that at this date the marshes further up along the Kankakee, say near Warsaw, and among the lakes in upper Indiana, would be better than those lower down in the State, where the water is higher. Such bags as have been made have usually been picked up on corn fields, and on the dry, hummocky marshes, where the ground is first to become warm. It is safe to say that while the bright weather may have brought in a flight this week it will be better to go about a week from to-day. The nights have been moonlit, and there is no doubt that the snipe have been traveling, and have passed over this country. As soon as they can find proper feeding grounds they will stop.

A Long Trip.

Some ten months ago Mr. H. P. Start, of Elgin, Ill., came into this office and made some inquiries in regard to Arkansas and other Southern States, saying that he intended to make a horseback trip through the South. To-day he again came into the FOREST AND STREAM office, and stated that he had made the trip, which I take it was in some respects a remarkable one. Mr. Start was accompanied by Mr. E. A. Bell and Mr. H.

Dennison, also of Elgin. Each had a riding horse, and they took also two packhorses. They traveled entirely by horseback and camped out all the time, starting from Elgin, crossing the long State of Illinois, crossing also the States of Missouri and Arkansas, the Indian Nations, and the State of Texas as far south as the town of Abilene. They thus had a splendid opportunity of seeing a great amount of country possessing interest in sporting resources. Mr. Start says that in the Indian Nations, about sixty miles southwest of Fort Smith, they had the best of sport on deer and turkeys. They got all the turkeys they cared for, and give a very encouraging report of that part of the country. The three were in the saddle for nine months, and have just returned. Mr. Start says that he will favor the FOREST AND STREAM with a story of the trip, which certainly should be most interesting.

"Unconstitutional."

Some of the fish dealers of Chicago, among others Charles Witte & Co., I. Polakow, Joseph Magziaz and William Shay, have prayed for an injunction against the State Fish Commission, stating that the latter is enforcing too severely Section 6 of the State fish laws, regarding the size of fish. The dealers say that this clause is unconstitutional. Of course it is. Anything is "unconstitutional" which does not declare Chicago a wide-open market for fish and game. But I cannot avoid a little dig at the State Commission, which has gone to so great lengths to accommodate these same fish dealers of Chicago. The Commission is on record as wishing to be very lenient in the matter of "first offenses," "alibis" and other pleas, which methinks are more pertinent to the opera of "Erminie" than to the Fish Commission. I wonder how friends Cohen and Bartlett will feel when they see these fish dealers reciprocate by trying to knock their pet clause into a cocked hat?

I note also with interest that the commission merchants, game dealers, shippers and hotel men of St. Louis will meet next Monday to take further action in the movement, earlier mentioned, for "needed changes in the game laws." Are we to infer that there are some clauses in the Missouri State game law also which are "unconstitutional?"

Trout.

I have reports from upper Wisconsin which say that the ice went out of the trout streams a week ago, and that the season is three weeks more advanced than it was at this time last year.

E. HOUGH.

1206 BOYCE BUILDING, Chicago.

Green Mountain Notes.

DURING the past winter the local fishermen have enjoyed unusually good ice fishing, as every favorable bay of Champlain has been, while the ice lasted, dotted with the tiny fish-houses of the anglers, some of whom fish for the sport, but the majority, I am sorry to say, for the "dollars in it." The fish chiefly caught are perch and whitefish, although some of the larger fishes are not infrequently captured. The suddenness of the breaking up of the ice this season came without warning, and many of the shanties were lost, the occupants barely escaping a watery grave. As soon as the ice leaves the marshes along the lake and the water gets back to its normal clearness the local sportsmen flock there in anticipation of the pickerel shooting, that usually lasts two or three weeks, as the weather permits. The favorite method of hunting them is from a canoe, and they are shot while basking and frolicking in the sunlight among the submerged flags and rushes. The favorite weapon for this spot is the shotgun, loaded with buckshot cartridges, although rifles of a heavy caliber are much used. The pickerel season has just opened here, but as yet few have been secured. Their weight generally averages about 5lbs., but occasionally specimens far exceeding that are brought in. The record fish so far this season tipped the scales at 17lbs.

The flight of ducks here this spring is fully up to the average as regards numbers; blacks, mallards and teal predominate. Vermont allows no spring shooting, and but few instances of violation of the law occur. But few ducks nest with us, traveling further north to their breeding grounds in Canada. The deep snow that northern New England enjoyed the past winter proved providential to the furred and feathered game, as the market hunters could not get about in the woods to carry on their work of slaughter, and the spring rabbits and ruffed grouse are more plentiful in consequence. Deer also seem, according to reports, to have wintered well, and notwithstanding the open season last October are yet with us in considerable numbers. Of late several cases of violation of the deer law have come to light in isolated places where the people think that deer can be killed at any time with impunity. A number of these cases are now being investigated, and prosecutions will undoubtedly follow, as in one instance the feet and other portions of a deer were found in possession of the suspected parties. As a whole the deer are guarded by the farmers with a jealous eye, and are in many instances allowed to roam with the cattle and become so tame from their protection that they have little fear of man. The open season last fall resulted in the destruction of many of these semi-domesticated animals, and the public at large and the press were loud in their clamor for the repeal of the statute, which undoubtedly will be repealed at the next session.

Another enemy to our song birds has appeared here, as the subjoined clipping, taken from the Burlington News of yesterday, shows: "We have laws in this State for the protection of insectivorous and song birds, and it would be well if the authorities were more strict in enforcing them. The Italian residents of East Montpelier must have tastes that are fastidious indeed, for not only do they slaughter our robins and snowbirds, and convert them into edible morsels for their own tables, but they are reported to be doing thriving business marketing our feathered friends among their countrymen in the cities. This is an offense that is both abominable and disgusting, and should be punished to the full extent of the law."

Of course "little things" like this will crop out in every family. But just the same it shows that Vermont

game protection partakes somewhat of the "more theory than practice" style in some portions of the State at least. It is to be hoped that the municipal authorities of the city will take up the case and stop the ruthless slaughter of innocents.

KENEWAH.

MILTON, April 2.

Winter Moose Killing in New Brunswick and Maine.

AROOSTOOK COUNTY, Me., March 27.—*Editor Forest and Stream:* Recent articles on moose slaughtering this winter prompt me to write you certain facts as I personally know them; and I believe that your long personal acquaintance with me will give you confidence in my statements.

For more than six weeks now moose steak has been served at a hotel in Edmundston, just across the river, in New Brunswick, with deer and caribou for occasional change. Of three moose whose horns have recently been purchased (to serve as trophies), one was killed in New Brunswick and the others here in Aroostook county. On my visits to Edmundston I have heard travelers at the hotel say they get moose steaks at the hotels up river on either side; meat is not disguised by another name, but it is "moose steak," plump and plain. More than this, lots of settlers and woodsmen of my acquaintance have told me of their getting out meat by the sled load; and these men go into the roads every year after the choppers are discharged, and get as much as they and their neighbors want. Of late years the snow has not been deep enough to decimate the moose to the extent of this season; but some are gotten with dogs every year; and snow has been so deep this season (5 to 7ft.) that a man finds it no trick to "do 'em" without a dog. There has not been such a depth of snow since twelve years ago, when, as now, the slaughter was immense.

There are writers now, as in previous times, who through sordid motives in some instances, and through ignorance of the facts in others, deny there is much, if any, illegal killing, and their misstatements make my gorge rise. I, who have spent so large a part of my life in the far-back woods, know the situation thoroughly. To be sure, a great many kill just to supply their own families (who would go hungry, otherwise, a great deal), just as their ancestors did; and they think it right, as they waste none and seldom sell. But there are others, and they kill, kill, kill as long as they can find a customer for skins and meat; and this class cross the river—the dividing line—and hawk it almost openly in New Brunswick. I verily believe there have already been killed fifty moose since Feb. 1 in the northern half of Aroostook county, and deer by the hundreds. Poaching goes on just the same on the Canadian side.

I give you these facts for your and my own satisfaction. It is five years since I have shot a gun; my hunting days may be over; but my heart is in the woods, and I want to see the game preserved so that others coming after me may be able to enjoy the sports I have. B. B.

Florida and "The Plank."

MR. F. M. GILBERT, of Evansville, Ind., who has recently been on an unsuccessful game expedition in the De Funiak district of Florida, sends us, as the results of his experience and observations and reflections, this summary of the situation:

To reduce the matter to figures, I have seen more deer in one day in Arkansas, hardly a hundred miles from St. Louis, than a good hunter can see in one month in this section of Florida. And, further, I did not have the help of the hounds in Arkansas, but had to still-hunt.

I will also assert that if one meets ten natives in the woods in that section, nine of them will have guns and five will have dogs that will pick a trail. I met a preacher coming out of the swamps one evening to call on a brother, and he had his Winchester across his saddle.

I firmly believe that there is plenty of game left in Florida, but to get it one must not stop at any railroad town. He must go so far away toward the Gulf that he can hunt in places from which the natives cannot transport their game. In other words, he must be so far from the railroad that a native with his ever-ready ox team could not kill a deer and haul it to the railroad before it spoiled.

Near any of the bays that put in from the Gulf the hunting is good—at least such are the reports.

If Florida only knew it, her market hunters are robbing her of millions of dollars of revenue. Who spends money in Florida? The native pot hunters? No! The people from the North. Take away the hunting and fishing, and Northern men will go somewhere else. A few consumptives may go there to sit on the hotel porches and eat air, but the average Northern man wants something a little more exciting.

The lesson that Florida teaches to-day is the same one that has been taught us of the North. Where are our deer and turkeys? Our wild pigeons? Our ducks and geese? Gone to market. A horde of greedy pot hunters have robbed our States of what belonged to us all.

If I owned a sporting journal, my one great and only text would be "Stop market hunting."

We have at last a non-selling law in Indiana, and we ought to have another, and that is, "Keep away outsiders." I know I am treading on the corns of many a good old Kentucky friend, but honestly, isn't it tough on us to protect our quail and then have Kentucky, Illinois and Ohio come in and shoot them?

The sportsmen of our State are just as courteous as those of any other, but all true sportsmen can see where we are drifting. We should throw around the little brown beauties—the only game we have left—every safeguard that man can devise and good laws carry out, or they will go as did the buffalo, the wild pigeons and all our large game.

Kentucky should join us in the good work. Our seasons should open and close at the same time, and thus stop that gigantic farce of killing in the open season in one State to selling in the close season in another.

The "short-billed snipe" farce should stop, and if I had my way I would tar and feather every hotel and

restaurant fraud who works it. Don't tell me they don't willfully break the law, for I know better. They think it smart to evade the law, and a lot of chicken-hearted, would-be sportsmen stand idly by and see them do it.

I started to write about Florida, but have gotten close to home—and I'm glad of it. I have exactly the same opinion of the pot hunter who breaks a law for gain and the hotel man who does the same thing, and if anything the latter is the worse.

Sea and River Fishing.

Fresh-Water Angling.

No. 1.—Brook Trout.

BY FRED MATHER.

UNDER the head of brook trout (*S. fontinalis*) will be included most all the trouts and chars, for the methods of taking the brown trout, rainbow trout and all kindred species except the Eastern lake trout, the blue-back and such deep-water members of the family as are seldom, or never, taken with the fly.

When a novice asks advice about the kind of an outfit he should purchase, I quote to him from Polonius' advice to his son: "Costly thy habit as thy purse can buy." And this means that an angler should have the best tackle that he can afford, for the best is all that the term implies. It is when the struggle comes with a desperate fish that the angler has the supreme satisfaction of knowing that he has the best material to fight with, and only an accident may lose him the fight, if he has confidence in his own skill in not overstraining his tackle by injudicious strikes, checking a vigorous run too suddenly, or by letting a fish get into weeds, or a treetop, when it might have been steered away from these things. All this is generalship, and cannot be taught by books, but the purchase of tackle can be taught in this manner. The first question which I ask of a novice is: "What do you care to spend on an outfit?"

If he answers, "Twenty dollars," I say, "Get a wooden rod, a click reel, line, leaders, flies, creel and waders." If he thinks he can afford a more expensive outfit I advise him that he will be better satisfied, and will give reasons for it as we proceed. In England there are some old-fashioned anglers who think that trouting with an angle worm is an art that ranks as high as fly-fishing. They were brought up in that belief, and a man's religious belief is most often the result of birth and early influences.

There is no question that the trout will take the worm in places where it will not rise freely to the fly, and there are places where the fly, in expert hands, will take more trout than the drowned worm. But, when it comes to a question of angling for pleasure and fishing for meat, I would rather take one trout with the fly than a hundred with bait. The newspapers have delighted in picturing the rural youth, with a "letter in the post-office," selling his catch to "the city angler with a \$40 pole," the inference being that fine tackle is useless. Fine tackle will beat coarse in the same hands, even in the hands of the barefooted boy.

Rods.

There is no rod equal to a good split-bamboo. I say good, because there are most miserable ones on the market; if you want one of the latter you can get it for a dollar in a department store. A set of nicely drawn ferules is worth more than that. Do not think of buying a split-bamboo rod anywhere but in the store of a reputable dealer in fishing tackle, and paying not less than \$8, and from that up to \$40, for it. I have a \$40 rod that has been in use for fifteen years; it has been cast with in tournaments, which is severe work, and it is as straight, springy and as good to-day as ever. If the split-bamboo is beyond your purse, get a good combination of ash and lancewood, a greenheart or bethabara; greenheart is a rather heavy wood, and of wooden rods I prefer two joints of second growth ash and a lancewood tip. See that the ferules are well drawn and fit all the way, snug. If there is a tendency to throw apart, try another rod. I do not care for dowels nor for very limber rods, such as "kick back," and are known as "double action."

A 10ft. rod is long enough, and the weight may be from 5 to 10oz., as one likes. Metal reel seats are a matter of taste, and I like them. The weight of a rod is no indication of its muscle-tiring power, as that depends largely on where the rod balances, i. e., whether it is topheavy or is light at the butt. See that the grip is not a blister teaser, wound with cord or other abomination. Often at the beginning of the season have I had to wrap a handkerchief about the grip at the first intimation of a blister. A large hand will cramp on a small grip, therefore the grip should fill the hand. Cork makes a good grip, and I have a felt covering which I use on a grip that is wound with rattan, but my hands are very tender.

A rod put together in a store and "tried" is not fairly tried. With a reel of more or less weight below the hand and 40ft. of line to lift from the water there is a different feeling. Test your rod in this way, by all means, before buying; then and then only can you decide if the rod is what you want. A rod may be an excellent one and yet not suit you and your style of casting; yet a man may get used to any rod in time, but will not do as good work, and as easily, as if he was better fitted in the first place. There has been imported recently a close-grained, reddish African wood, called asagai, which is used by the Zulus for their spears, which are called by the same name; and this is said to be superior to lancewood for the springy shafts of golf sticks, and may come into use for rods. Ironwood, or hornbeam, is too heavy and will warp.

A jointed rod is merely a convenience; a one-piece rod is the ideal rod for a man who always fishes in one place and keeps his rod there. I once saw such a rod made of red cedar, and its action was fine, but it was so fragile that its owner would not allow another to handle it. Three joints are better than two, for there is no ferule in the middle; but beware of the "trunk rod," a

thing of four or five joints. Have none of it. There is another sort of rod to be avoided, and that is the "general rod;" it can be by many combinations be made into a fly rod, a trolling rod, a deep-sea rod, and a striped bass rod for casting a bait far into the surf. It is as useless for any of these purposes as a saw-log would be. I own one, presented as a prize in a poultry show some twenty-five years ago by a Boston firm, and I put it together every year, admire its ingeniously contrived uselessness, and return it to its case.

Lines.

It is vitally important to a fly-caster that his line should fit his rod. A rod with a given "backbone," or stiffness, will cast a line of a certain weight to the best advantage and with the greatest ease to the caster. No rule can be laid down for this, because the backbone of the rod is an unknown quantity. The best way is to go to a reliable tackle dealer who is himself a fly-fisher, and have him advise you what weight of line to use. In waterproof silk lines the weights are expressed in letters from A to G, the latter being the heaviest. These lines come in lengths of 25 to 50 yds., both tapered and untapered. I prefer a tapered line; it is so braided, never twisted, that the last 20 or 30 ft. on each end gradually tapers to almost the thickness of the leader, and this gives greater weight beyond that distance; and this is of advantage in long casts. If it is not possible to find a fly-casting tackle dealer near you, write to any advertiser in *FOREST AND STREAM* and tell him what kind of a rod you have, and ask his advice about a line to suit it. These men are the leading dealers in America, and know their business.

Better a line a trifle too heavy than too light for a rod. A limber rod will cast a heavy line better than a reversed combination. A man with a tolerably stiff rod, such as I like, who has a line only a little too light for it, is troubled to get his flies out, and tires his arm with the effort.

There are silk lines which have a copper wire in them, but never having used one, nor even seen one in America, I cannot imagine what the wire is for. In boyhood's days horsehair lines were used and I have braided them by keeping three crow quills filled with hair from the tails of horses, taking care that the ends in the quills were replaced by other hairs; but that kind of line will not suit the fly-fisher of to-day, and I was only a hand-liner then. The fly-fisher must have a line which will not add to its weight by absorbing water, hence waterproof silk is best, but never put such a line in salt water, or it will be ruined. Do not use any kind of a cotton line for fly-casting, for they will kink, and may smash a tip by a sudden check in the rings. Linen lines may be waterproofed by several formulas, which I have, but can't give them in detail now.

The essential points in a line for fly-fishing are: Flexibility, incapacity to absorb water, and so increase weight, and the absence of all tendency to kink. If you will imagine yourself with a fighting trout 40 ft. away, and with a twisted kink which will not go through the loop at the tip of your rod, you will clearly understand why a limber, kinky line is to be avoided if you wish to avoid oratorical efforts when not speaking in public. If your purse will stand it, buy only a braided silk, tapered, waterproof line; they come high, but they last long. I have three of different weights which have been in use for from twelve to fifteen years, and seem as good as ever. I test them each year, and from one there is gone about 5 ft. from each tapered end, mainly in knots cut from leaders, but in two instances a break in a weak spot. These lines cost from \$2 to \$5, but they were worth it. A lot of inferior lines would have cost more during the same time, and might have failed me in an emergency.

What do we fish for? Not for fish, because we can go to market and buy them for much less than it costs to go to the trout streams. Of course I refer only to the man of business who is "chained down" for eleven months in the year, and continually sings, with Dr. Bethune:

"Oh, that the willow's leaf were free,
And the dogwood were in flower."

Like Silas Wegg, I can't help "dropping into poetry" at times, for the angler is a lover of nature, and all nature is poetry. Just now the trout season is near, and then the angler's blood is stirred as he sees:

"Daffodils,
That come before the swallow dares, and take
The winds of March with beauty."

Lines on fish, or on fishing seasons, seem to have been crossed or have been brought so near that induction resulted in the above conglomeration of lines cast in pleasant places. Let us get back to business and consider:

Reels.

Speaking as a zoölogist, I would say that there were: Genera, II.; species, innumerable. The two genera differ radically, while the species vary only in detail.

Here is an artificial key to the genus Reel:

(a) Winch of wood or metal with crank.

(b) Winch, as above, with click.

(aa) Automatic machine which pulls in a fish when the "little finger" presses the button.

Then there are multiplying reels with a combination of click and drag, to be used as desired. A click is a check, or drag, and is not to be used where baits are to be cast with a free-running reel. I dearly love a click reel for trout; its cheery song when a trout is taking line is one of the charms of fishing; and I love to reel in a fish with my hand on the crank. Some good anglers prefer an automatic where you "press the button" and the reel does the rest; but I am willing to do the rest. My favorite reel is a click with raised pillars. The two plates of a reel are kept apart by small posts, if that is the right name, and are held together by screws which go through the plates into these posts; and when your reel is filled to the posts it will take no more line. The "raised pillars" are merely raised projections on the plates which enable the reel to be filled with more line.

My reason for preferring such a reel is because I use a very heavy line, and need either raised pillars or a wider reel to hold its 50 yds. Few anglers carry as much line, and it is not necessary for ordinary trout

fishing; one-third of it may be enough, but every angler gets notions of his own.

Trout reels are not as expensive as those free-running ones for striped bass and other fishes. The latter often cost \$30 and \$50, while a trout reel may be had from \$3 to \$8, not counting the things stamped out of tin, which cost a trifle and are worth less—or worthless, as you please.

Here is a point: Put 25 yds. of line on my favorite reel, and a turn of the crank takes up slowly, for the spool is too wide for that length of line to make much at a revolution; there is nothing left on the spindle. Therefore a short line should have a narrow reel. Over thirty years ago Billingham, of Rochester, N. Y., a celebrated rifle maker, made a reel entirely of wire, on a central plate which may have been 1 1/2 in. in diameter; he soldered rings of wire of about 1 in., and the line ran in these. The object was to have the reel dry the line. I bought one, but as it had no click I dropped its use, and I have not seen one in years. Then came perforated plates, and no end of inventions.

Perforated plates should not be depended upon to dry a line, for after a day's fishing it is seldom that there is not a chance to unreel it on the floor and dry it, while at home you should have one of the many appliances for reeling off the line and drying it. It does a line good to be reeled off, changed end for end and handled, especially if it is an enameled waterproof silk line. Such a line, if left long on a reel, has a way of sticking to itself, not so that it requires force to separate it, but enough to roughen the surface.

If there is one thing which the careless angler is apt to overlook in his care for his outfit, it is the reel. It worked all right last week, or last season—why not now? My friend, as gross a piece of machinery as a wheelbarrow needs oiling at times, and your reel may have had its oil washed out in the rain, or some sand may have gotten into its mechanism. I pray you to have a little screw-driver, of which the blade is not over 1/4 in., and treat your reel as if you loved it; take it apart, wipe and oil it, and trust it to be true to you. I have such an implement, made of nicked steel, and perfectly flat, which is carried on my key-ring. It is 1 1/2 in. long and less than that at the rounded end. Before this is put in type I will show the implement to two of New York's large tackle dealers, and they may put some such implement on the market. A good reel is like a good gun; it is all right when you buy it, but its usefulness thereafter depends upon the owner and the care which he takes of it.

Leaders.

Upon the soundness of the silkworm gut in the leader, or "casting line," as it is called in England, depends the strength of the tackle. It is the weakest link in the chain. It is seldom that a rod or a reel line is broken, but if accident occurs it is usually to the leader. Good gut costs more than poor, but it is well worth it. The best is of uniform thickness and round. The latter quality is ascertained by rolling it in the fingers. Leaders are best bought already made, from a reliable house which has a stock of gut to select from, and the makers can select gut and make neater knots than the amateur. There are anglers who like a tapered leader, the first few feet of twisted gut; but I don't care for it. Others like a 12 ft. leader, but my choice is one of even size, not less than 6 nor more than 9 ft., and tied with slip knots, which allow the fly to have its loop cut off and the leader knots slipped apart for its insertion; then when the leader is drawn together the fly is secure, but easily removed. The next best thing is a looped leader into which the flies can be readily looped and removed, and the latter is a desideratum, for when we fasten a hand fly with a loop on it to a single line it is hard to remove. The loops are used to fasten hand flies as the tail fly, or dropper, is fastened, two loops being interlocked without a knot.

The color of a leader is a matter of individual taste. The late Francis Endicott had blue leaders for use when the sky was clear, tea-stained leaders for thunderstorms, and white ones for a sky filled with white clouds. I have my doubts about the ability of a trout to appreciate all this attention to his vision, and use a bluish leader at all times. The theory is that the line is a thing to be seen, but that the fly is some distance away, and its connection with the line is invisible. This is true when there is a ripple on the water which hides the fall of both line and leader, but on perfectly still water trout will often rise when the fall of both line and leader is seen, especially if the leader be shiny. Such conditions are not favorable for frequent rises, but they occur.

The light rod needs a light line and a light leader, i. e., all three should be in proportion. In a long cast the line strikes the water before the leader has reached that spot, and then the latter goes on and straightens out. To illustrate this, put your finger tips on your shoulder, strike your elbow on the table, and follow with your wrist, knuckles and fingers. That is the way a fly goes out. To cast a fly in this manner is quite an art, which may be considered later.

Flies.

I might as well confess that in the matter of flies I am a Philistine, because the adherent to the natural school will rise and call me so. Many books have been written about artificial flies and how to tie them so as to imitate the natural insect, and I may have a dozen such books beside the chapters on flies in a hundred general works on angling, for my angling library is a large one, a collection of over thirty years. Besides this I regularly read the *London Fishing Gazette*, in which hardly a week passes without an article or at least an item about dressing flies to imitate some fly, caterpillar, moth, or other thing on which trout feed, and by an imitation of which they may be deceived into taking the hook that is concealed therein. I mention this to show that I have studied the subject in the books and on the streams, and I hereby avow my opinion that fidelity to nature in trout flies is a humbug.

I know scores of anglers who use all sorts of non-descript flies, but know of none who has had the courage to assail this antiquated, yet popular, belief. This is the rankest kind of fly-casting heresy, and will be so received in England, where they are more conservative,

and have more reverence for traditions than we have; but it may not pass unchallenged on this side of the water. But as I have already called myself a Philistine, they are spared that trouble.

For years anglers have shed ink in asking: "What does the salmon take the fly for?" And it has not been satisfactorily answered. A salmon fly, let it be a Jock Scot, silver doctor, or other well-known killer, does not resemble any insect that ever inhabited the earth, and as the adult salmon when ascending rivers to spawn takes no other nutrition than Jock Scots, doctors, silver doctors, mandarins and the like, all of which have a barbed steel sting in their tails, the question is a puzzle at which we all may guess. Most of these salmon flies are as gaudy as flies can be made, but they are creations of the fly-tyer's fancy; but salmon take them, and there our knowledge ends.

The long and lengthening list of trout flies contains more nondescripts than alleged imitations, and I use the word "alleged" advisedly, for when I see a beautifully illustrated page of natural flies and their imitations I wonder that a trout could think them genuine. As I write I have before me the third edition of "The Practical Fly-Fisher," by the late John Jackson, London, 1880. The lithograph plates are fine, but I will only criticize the first plate. Here are four natural flies and their alleged imitations. Three of them may pass, but No. 3 illustrates what I have said: The natural insect has the shape of a bedbug; has four wings; the hinder pair are drab, while the others are scarlet. The imitation looks like a brown hackle, all hairs. If the student will turn to Plate VII. and note the pictures of Insects Nos. 35 and 38, and their "imitations," and can then believe that a trout can see any difference between the imitations, then he has the gift of imagination.

Size, color and form attract trout in the order named. Trout in some streams and lakes will only take large flies, but these waters are usually remote, and the fish have not had the caution bred into them that trout in waters which have been fished for years have got. Men may argue about reason and instinct, but it is a fact that a green backwoods trout will rise to anything that is offered, just as the Sheriff of Wayback comes to New York to buy green goods and gold bricks; but an old trout, often pricked, learns caution, and transmits that quality to its progeny; the heedless young trout takes the first lure, and has no progeny to transmit its rashness to. If this statement needs proof, let us look at ducks, deer and other animals which once merely kept out of reach of the man who had the bow and arrow, and see how their progeny have increased the distance as man has lengthened his reach, first with flint-lock rifles, good for 100 yds., to their caution to-day. There is no instinct in it; it is reason, pure and simple. The wounded that survived learned a lesson and transmitted it to their posterity.

If we admit this, why not admit it in the case of the trout? We might as well do it, because the evidence is all on our side. In the State of New York there is the great Caledonia Creek; it would be a "river" in some parts of the world; it has been fished for many generations, and a man might cast several days over thousands of trout, and not get a rise. Then comes a day when they will rise for natural flies by the thousand, but a strange angler who uses as large a fly as he takes trout in the Adirondacks with would have the torment of Tantalus about him, trout rising everywhere but at his flies.

A glance at a list of trout flies will show that most of them are nondescripts, such as red ibis, Ferguson, Parmachenee Belle, Montreal, queen of the water, grizzly king, Abbeville, jungle cock, beaver-kill, king of the water, Governor Alvord, St. Patrick, Professor, Rangeley, Henshall, black prince, General Hooker, and a hundred more. Many of these are favorites of long standing and great reputation as killers. Against this we have but few so-called imitations of the natural fly, such as white miller, green and gray drakes, stone fly, cow-dung, black gnat, sand fly, alder fly, May fly, black and red ant, and a few others.

All flies can be made on different sized hooks, and as a rule you may use a larger fly where the fly is not much used, and they seem to attract green trout better than small ones. Some twenty-five years ago I fished some mill ponds back of Peterboro, Ont., and they preferred flies tied on No. 4 Sproat hook to the smaller ones, while on Long Island I never used a larger hook than an 8 Sproat, and often a No. 10. Therefore no special directions can be given as to the size of the hook the fly is tied on.

The dealer has a bewildering display of flies to offer, because he has occasional demands for some of them, and the names are on them, or even he would be in doubt as to their "pedigree." I freely confess that of the vast numbers of trout flies I "know them by sight," but cannot name more than twenty; and that is enough to be intimate with, although one may have a nodding acquaintance with many of the herd.

From eight to twelve kinds of flies are enough for most waters, but the angler will need half a dozen of each kind if he is out for a week's trouting, for flies have a way of eloping with a handsome trout, of preferring to remain imbedded in a sunken log, or of choosing rest in some tree top, and if the trout are choosing to feast on that kind of fly at that time, and you have no duplicate, why there you are!

Ignoring the names, the angler, having settled on the size, will do well to select an assortment of colors. Suppose he decides on eight varieties; then he wants a white-miller for dusk, a royal coachman or some fly with both white and dark for early dawn and late afternoon, with browns, grays, reds, yellows, and a couple of combinations of these colors. If he takes a dozen varieties he can select four more variations, for flies are made in kaleidoscopic variety. Flies are made in such great variety for the same purpose that Peter Pindar's razors were.

If, however, the trout angler be a worm-fisher, as many unconverted good men are, then I will say unto him: Use the slim, long-shanked hook known as the New York trout hook; or, if that is not obtainable, the long-shanked Kirby will do; but for the worm the ordinary shank of most hooks is too short.

As this article has been taken up by talk about tackle, I will reel up and consider how it is to be used for trout.

both with fly and worm; but what I have said about flies may bring a hornet's nest about my ears from those who are shocked at my disregard for tradition when it does not accord with experience; but what can they expect from a Philistine, if that is the proper term for a man who does his own thinking?

Massachusetts Trouting.

BOSTON, April 1.—The trout season in Massachusetts opened to-day. The weather all through March, up to the last day, was very favorable to trouting. Yesterday opened with a snowstorm, however, and this morning the mercury was below freezing, followed by a chilling wind all day from the northwest. But the weather has scarcely dampened the ardor of many of the rod and reel sportsmen, many of them departing for the fishing grounds the night beforehand, in fact. At Sandwich, on the Cape, a number of sportsmen were assembled early. The mill stream at that place was fished with some success. The Spring Hill brooks emptying into the bay, were fished. These brooks are most of them closed, but a few are still open to the public. Marshpee River, formerly fished by Daniel Webster, and later by Grover Cleveland and Joseph Jefferson, was not neglected, though with what success it is yet too early to learn. The flooded cranberry bogs in the eastern part of the town will be fished later, which fishing it requires a permit of the owners to enjoy. As soon as the bogs are drained the fish go out into the larger streams or the bay. Some of the cranberry bog owners have come to consider the trouting privileges they sell very much in the nature of a revenue, and they will keep the water up a few days longer for the sake of this revenue.

Most of the best streams in the vicinity of Plymouth are closed to public fishing, but permits can be obtained of the owners, unless they are sportsmen or clubmen themselves, in which cases one must be a friend in order to obtain permission to fish. Eel River at Clintonville still affords some good fishing, many trout escaping from the Forge Pond property and the Old Colony Trout Co.'s ponds. Swan Hole stream is still open to the public, I learn, and at times some good fishing is to be had. The Duxbury and Plympton streams have some trout waters open to the public, but they are fished too much for any sort of success.

There are some trout brooks in the town of Quincy, and occasionally the knowing ones, who have been acquainted with these brooks for years, get some handsome trout. A gentleman who lives in that town said to me the other day: "I shall be on one of the brooks that run right through the town at daylight on the opening day. Last year I had four handsome trout to take home to breakfast, and did not go outside of the city limits." These streams are fished a good deal, with little success, and the fishermen who do take trout are very careful to conceal the location and what they have done; otherwise the brooks would swarm with boys. Even in the limits of the city of Brockton trout are occasionally taken by those who know where to fish for them. One or two streams run through the town, once splendid trout brooks, and occasionally a trout or two are to be had. Last year a gentleman came in from his place of business to dinner. His little boy of eight years met him. "Papa, there are some fishes over to the brook," he said. His father went over with the little fellow, and boy like he had penned in a couple of fine trout with sticks and sods. Fearful that the trout might escape the father, a good deal of a trout fisherman, jumped into the stream and quickly scooped out the trout with a new straw hat he had on, it being the only net he had at hand. The trout weighed nearly ½ lb. each, and the captor spoiled a new hat and injured a pair of patent-leather shoes.

In Leominster there are a number of good trout streams and more enthusiastic trout fishermen than in almost any other town in the State, with the possible exception of some of the other towns in Worcester county. Among the fishermen may be named Herman Derby, Warren Lewis, C. W. Burbank, E. D. Moody, J. Bell, Warren Emerson, Fred A. Whitney, J. A. Hannis, Mark P. Smith and Jerry Wells. The streams in Ashburnham, Sterling, Lunenburg and Lancaster are also considered common property by these fishermen, though much to their disgust the owners of the land on the streams are inclined to post their fishing privileges. But in almost every case the farmers are said to be reasonable, and even generous, if fairly treated. There are one or two good trout brooks in Byfield and vicinity, and some restocking has been done, with the brook properly protected. C. H. Tarbox and Oren and Charlie Bailey are among the best known local fishermen, and if some good strings were not taken on the opening day it was for the good reason that snow water from the storm of the day before was running, while there was a little ice in the streams early in the day.

In his day Gov. Talbot was a fisherman, and through his influence the streams and ponds in the vicinity of Billerica and Lowell were stocked with trout, and soon there was some good fishing. But since his death the brooks have been badly fished out, with very little being done to keep up the supply. As might be expected, the fishing is poor in that part of the country. The brooks in Middlesex county are well adapted to trout growing, and local lovers of the rod and reel say that if the State would do what should be done toward restocking and protecting these streams against unreasonable fishing, they might be restored to something of their original prestige.

Congressman John Sinipkins, whose death on Tuesday came like a shock to his many friends, was a great lover of the rod and reel. He had fished most of the trout streams of the Cape, and was well known as the companion of the late Gov. Russel, Bayard Thayer and John Thayer on their many fishing trips to Birch Lodge, head of Richardson Lake, Me., and the celebrated B. Pond, a few miles from the same lake. Every season, when the pressure of political and professional duties has permitted, he has made his loved pilgrimage to that Mecca of the rod and reel, where fly-fishing begins early. This year his friends mention that he was already counting the days for the ice to depart, but death has all too early cut off another beloved follower of the gentle Izaak.

SPECIAL.

Sea Fishing Near New York.

ALTHOUGH a majority of the New York city angling readers of FOREST AND STREAM belong to the class which finds its sport in the mountain streams or lakes, miles from home, yet I doubt not that there are a goodly number among them belonging to the class of those who, through force of circumstances, cannot leave home and business for weeks, or even days, at a time, and who, if they desire to indulge in their favorite pastime, must perforce find the sport near home. To such a one this means that he must fish, if at all, in salt water. True, there are places quite near New York where a few fresh-water fish can be caught, but they are scarce, and the sport to be had at these places does not justify the necessary expenditures and time consumed in making such a trip.

For the benefit of the latter class of fishermen, I send you this note on the fishing as I have found it in the waters near New York, and hope that others will let us hear from them in regard to the fishing at other points in this vicinity.

Probably the most popular resort for the salt-water fishermen is the Fishing Banks, located off Long Branch, N. J., and in that vicinity. A number of large and commodious steamers leave New York daily for the banks; their schedules are given in the daily papers. These boats are fitted up especially to suit the convenience of fishermen, and carry on board bait, tackle, etc. The fares range from 65 cents to \$1. At this season only cod and ling are caught on the banks, but blackfish, fluke and sea bass are caught in season. The best sport is had in the summer, when the large sea bass are caught. These fish furnish more sport than most people imagine, and one can invariably get a good mess of them or of other fish when the conditions are right. Skimmers are used for bait, and a heavy sinker is necessary, because of the strong tide and rough water. On the Fishing Banks boats everything is done to make the fishermen comfortable, and often entire families make the excursion. Except for the fact that this trip affects persons who are inclined to biliousness, and thus involves seasickness, it would be a pleasant outing for anybody.

While the fishing steamers embody everything that is essential to a pleasant fishing trip, the best way to enjoy a day's fishing on the Banks, and avoid the crowds which patronize the steamers, is to go on one of the numerous fishing sloops that are to hire for this purpose. Canarsie and Sheepshead furnish most of these. They can comfortably accommodate a party of eight or ten, and can be hired for from \$8 to \$10 per day. The owners of these boats, who usually sail them, do all in their power to please their patrons, and furnish bait and tackle. They will start at any hour of the day, and fish as long as the party demands it. It is when the bluefish are biting that these owners reap their harvest. Their boats are out on every fair day, and rarely return without a good catch. The bluefish are caught by trolling with a squid, made of lead or wood, which is furnished with the boat. The captain lands most of the fish, as it requires considerable skill to land bluefish. The "bluefish swing" is not mastered by everybody. A day of blue-fishing aboard one of these boats is well worth the slight expense attached.

Among the best known of the Sheepshead Bay fishing sloops are the Sly Fox, Capt. W. J. Fox; Gertrude, Capt. W. J. Cowdrick; Pacific, Capt. Nat. Wilson; Jennie S., Capt. Isaac Corson; Daisy, Capt. J. Fowler; Annie C., Capt. John Greenwood; Cricket, Capt. J. Canute; Carrie, Capt. Isaac Miller; Nettie, Capt. Jerry Greenwood; Russell, Capt. Henry Canute; Nathalie, Capt. G. Ayen; Rhoda C., Capt. John Colwell.

Next to the Fishing Banks, Jamaica Bay probably furnishes sport for more fishermen than any other place in the neighborhood of New York. The fishing stations on the Rockaway trestle, Goose Creek, Broad Channel and Beach Channel, are the best points from which to reach the fishing grounds. These are on the line of the New York and Rockaway Beach R. R., which has its terminal at the Atlantic av. depot of the Long Island Railroad at Atlantic and Flatbush avs., Brooklyn, and at the Long Island Railroad depot in Long Island City. Sea bass, blackfish, fluke, flounders, porgies, weakfish and snappers are caught here. The fishing grounds are all within a few minutes' row of the boat houses. Row boats can be hired for 75 cents and \$1 per day. Sandworms and clams are principal baits. Night weakfishing is a popular sport here. Weakfish are numerous in the months of August and September. Shrimp and pearl squids are used for bait for catching weakfish.

Canarsie is another point from which the fishing grounds of Jamaica Bay can be reached. Trolley cars from the foot of Broadway, Brooklyn, and the Canarsie Railroad from East New York, furnish transportation to Canarsie. Crabs abound in the waters about Canarsie, and while crabbing can hardly be looked upon as sport, yet it might furnish a day's amusement when the fish are not biting. Moreover, the crab is a toothsome creature, and when full of meat makes a delicious morsel.

Sheepshead Bay, a small body of water separating Manhattan Beach from Brooklyn, and connected with Jamaica Bay by numerous small creeks, is the means of reaching a number of good fishing spots. Few fish are taken in the Bay proper, but some of the best fishing in the neighborhood of New York can be had within a short distance. In the spring the flounder fishing in the creeks and off Ritchie's Point is all that could be desired. Later in the season, when the fluke are biting, no better sport could be found than around the "Can" Buoy off Rockaway Point. Both still-fishing and trolling with "killies" for bait are effective. Porgies and blackfish are taken off Ritchie's Point. Clams are used for bait for porgies, while fiddler crabs make the best bait for blackfish. Weakfishing is uncertain, being good and poor in turns. In the latter part of September and early in October of last year the weakfishing in Rockaway Channel was very good. Night fishing is rarely attempted. Three of us tried it one night last year, when the fish were being caught daily in large numbers, and caught three colds and one dogfish. In the fall the snappers, or young bluefish, furnish plenty of sport. These are caught in the bay as well as in the creeks. Spearing, or white bait, as it is commonly called, is unquestionably the best bait for snapper fishing. I use a

light fly rod when fishing for snappers. They make a good fight on a light rod. Striped bass, blackfish and sea bass are caught at the "stone pile," off the Manhattan Hotel, reached after a hard pull from Sheepshead Bay around Point Breeze and along the outside of Manhattan Beach. In September and October of last year striped bass were caught in large numbers. Catches of from ten to twenty fish, averaging about 3 lbs. each, were not uncommon. Usually, however, the striped bass fishing is not so good. They are caught by trolling around the jetties off the Manhattan. A spoon and blood-worm are used for bait. The blackfish and sea bass are plentiful here, and are usually big fellows. Sheepshead Bay is reached by trolley from the Brooklyn Bridge and the ferries, and by railroad from the Atlantic Avenue Depot of the Long Island Railroad. Good fishing is to be had along the south shore of Staten Island, at the stations on the Perth Amboy division of the Staten Island Rapid Transit. Huguenot, Tottenville, Gifford's and Prince's Bay are the best known of these places. The weakfishing in Prince's Bay is exceptionally good in season. Catches of twenty-five to thirty-five fish to one man were frequent last year. Weakfish are frequently caught here by using a piece of salt pork and a small piece of red flannel for bait. Porgies, snappers and others of the smaller fish swarm in the waters of Staten Island. Fluke and porgies are taken from the pier at South Beach, and occasionally a few weakfish can be picked up.

BROOKLYN, N. Y.

G. F. DIEHL.

Winter Pastime.

It has been said—and who will gainsay he wisdom thereof?—that this is a world of compensations; that there is no great loss without some small gain; and that every thorn has a rose for a neighbor. This is but another way of saying that age is not without its pleasures, nor maturity of years without its advantages. Many of those now in mid-life and beyond find much enjoyment in retrospection and the many pleasant experiences and recollections of the past; in recalling the congenial spirits assembled for the May training, and the various contests of agility and strength in which they were participants or interested spectators—jumping, wrestling, putting the shot, pitching quoits, and the like. Again is recalled the wonderful muzzle-loading flintlock shotgun, and the story of its achievements rehearsed for the thousandth time without suffering any loss or diminution by age; of the wonderful destruction wrought to the vast flocks of wild pigeons; the renown won at the Thanksgiving turkey shoot; and the clean killing of gray squirrels from trees of fabulous height.

Nor were days beside the noisy brook or on ruffled lake unknown, for the dainty trout and mighty mascalonge not infrequently graced their larder and diversified the frugal meal.

It is true that modern appliances and modern methods have long since superseded the appliances and methods of more primitive times, and that many devotees of rod and gun now sit in judgment and condemnation of much that gave many now of mature years great amusement and lasting pleasure in their boyhood days.

But all the same many of those of older growth—men who are rapidly approaching the limit of life, or who have already passed beyond the Scriptural days of threescore and ten; men whose heads have whitened, but whose hearts are still young; men who yielded to the allurements and tasted the sweets of nature in their earlier years, and who cherish many, very many pleasant experiences with rod and gun as prized remembrances—may hope to be pardoned by the tolerant and thoughtful if they refuse to be governed in every detail by the modern interpretation of the canons of sportsmanship, and recur to some of the pastimes and pleasures of youth for a day, even though its hours be spent in the commonplace sport of fishing for pickerel through the ice when the laws of the land intervene to prohibit other sport.

I am frank to acknowledge that I have not outgrown my early love for a day out in midwinter on the ice, and this weakness I boldly avow even at the risk of having the right hand of fellowship of many withdrawn for indulging such unseemly, plebeian propensity.

We always divide the anticipated pleasures of the day into two parts, the fishing and fish and the accessories; we go whenever we plan to go; sometimes the weather clerk is for us and sometimes "agin us," but it is all the same to us—we go; sometimes the sign is right for us and sometimes it is right for the fish; sometimes we get the fishing, fish and accessories, and sometimes we have to charge up all the pleasures of the day to the accessories; the accessories never fail.

The weeks are not many since a quartet of congenial spirits spent a balmy winter's day upon a not distant pond upon the invitation of one of the party, a mutual friend, who with a few boon companions owns a private camp in a grove of pines upon an island near the center.

The camp is commodious, well lighted, and provided with a huge fireplace built of boulders laid in colored cement, tables, chairs, bric-a-brac, and all the little et cetera that sportsmen know so well how to provide, and which they appreciate so highly. Connected therewith is a kitchen, supplied with cooking range and all the utensils necessary for the practice of the culinary art.

Arriving at our destination after an exhilarating drive in the clear, bracing air of winter, a roaring fire is soon blazing upon the hearth, imparting grateful warmth and good cheer, and perfuming the air with the fragrant incense of burning pine, the volume of smoke gracefully curling upward and losing itself in the branches of the trees.

We were to be the guests of one of our number, who provided the commissariat and essayed to play the role of cook and host, and who exacted from his guests only pickerel enough for the fish course.

He was soon left alone, and if not in his glory, at least with unbounded enthusiasm and determination to do himself proud, the rest of the party betaking themselves to the work in hand upon the ice.

As the day waxed apace the temperature rose above the freezing point, making it a delightful day to be out, and the frequent click of the tilts told us that we had callers from the depths, and that success awaited our

efforts, and that to-day it would be an even race between the fish and the accessories.

A generous supply of the voracious black and gold reticulated *Esox* was dispatched to the camp, and while mirth, jest and success were mingled in due proportion, and served to run the hours swiftly away, yet the active outdoor exercise, joined to pleasurable anticipations and savory odors, developed keenest appetites and made us impatient for the coming of the noonday hour. This at length arrived, and the mellow notes of the horn sounded as sweetest music on the air and gave notice that cook and host was ready to give an account of his stewardship.

The several courses received ample consideration, and doubtless the pickerel in the pond kicked up high jingoes while we spent ample time in their discussion. At the close all stood up and joined in drinking a toast to the health, happiness and long life of Mr. Julius Kaufman, the best man in New York.

This was followed by English plum pudding with brandy sauce, the whole topped off with toasted crackers and cheese and *café noir*.

With the waning sun of the afternoon we returned to the pond and added a number of beautiful pickerel to our score, and rounded out a day of rare enjoyment and pleasure, even though we spent it along lines tabooed by modern sportsmen and condemned by the ultra canons of sportsmanship.

GEO. McALEER.

WORCESTER, MASS.

CHICAGO AND THE WEST.

About Tennessee Bass.

CHICAGO, Ill., March 26.—After I get rich, as I think I shall in a few months in the newspaper business, I am not going to do anything but accept invitations to go shooting and fishing. This time it is Dr. N. A. Neeley, of Cookeville, Tenn., who without knowing anything at all about my appetite, asks me to join him as his guest. He also wants to know a few things about how to catch bass, and I presume he will pardon me if I share his inquiries with the readers of the paper. He goes on to say:

"I am a constant reader of *FOREST AND STREAM*, and upon these grounds I desire to ask a favor. Some time during the next month or six weeks I expect to take a fortnight's fishing trip on the Cumberland River, and I wish to spring a surprise upon the black bass and pike of that stream. They live in the backwoods of Tennessee, and never heard of a fly, spoon or any other human invention; they are accustomed, too much so, to nature's remedies, worms and minnies.

"The fact is I am not much better informed in the fly line than the fish themselves, but with your assistance and that of some literature on the subject I hope to be able to introduce them to some of the mysteries of modern anglerism. Will you kindly advise me what flies and other artificial bait to use, the most suitable rod and reel and line; also the best hooks (with leaders) for bait-casting.

"I want a medium-priced rod and reel, of medium weight and strength, one which I can use in New Zealand waters, where trout grow to 20lbs. weight. Can you give me the name of a small treatise on first principles in fly and bait-casting?

"Could you not spare the time for a trip to the backwoods of Tennessee? I would have a horse and buggy meet you at the railroad, or if you preferred you could come via river steamer from Nashville to Granville, Tenn. I promise you a royal time if you are fond of fishing. Thanking you in advance,

"N. A. NEELEY, D.D.S."

Dr. Henshall wrote two books, "The Book of the Black Bass," and "More About the Black Bass," with very little more excuse than the above letter would give. And since the worthy Doctor had to try a second time in order to tell all he knew about bass fishing, I might have to add to my book if I wrote it now in *FOREST AND STREAM*. It is too big a subject. What Dr. Neeley wants is not so much a book—though he will find both the above directly in his line and just what he requires—but a companion, some one who understands both fly and bait-casting. This is something which cannot be told in brief.

What might be very well for one bass water might not do for another, and I do not know anything about the Tennessee river, though I have had friends tell me it is a fine stream for bass. First, as to the fly-rod. The best ones cost \$25 to \$30. If you get the best, 6oz. is heavy enough. If you pay as low as \$10 or \$15, get a rod of a couple of ounces more weight. The split-bamboos run highest in price, of course, and many prefer them to lance or bethabara, though of course splendid rods come in those woods too. In fly-fishing briefly crack your whip, and crack it as long behind you as you do in front. The art cannot be taught by mail very well, any more than French or painting.

As to the flies, I can not say surely, of course, what would be best. If I were going there in ignorance, I should take silver-doctor, Ferguson, Seth-Green and the fly known in this city as the Johnson-Fancy. I have found these good, also the jungle-cock and polka-dot. The Johnson-Fancy, above mentioned, is a weird-looking affair, but it seems to kill lots of bass.

For bait-casting, the rod costs less and the reel costs more. The rod for frog-casting has of late been put on the market quite too short, to my notion. I personally prefer a casting rod pretty close up to 8ft., with some spring to it. You can shoot a frog further with a 6½ft. rod, which is stiffer and more easily controlled, but with the longer rod you have a great deal better fun playing your fish, and for river fishing, especially with minnow bait, the more flexible rod gives better sport. The motion of bait-casting is like throwing a rotten apple off a stick—a long, sweeping switch of the rod. The reel is thumbed delicately all the time, and thumbed sharp as the bait lights. Fly-casting is easier to learn than bait-casting.

The hooks for bait-casting should not have leaders attached to them, but only snells, for you have to reel up the bait close to the end of the rod in casting. The line should be fine braided silk, such as may be seen advertised in the columns of *FOREST AND STREAM* in dif-

ferent places. The reel—well, it costs some money to get a watch, and it costs some money to get a good casting reel. If I had to choose between the two, I'd just look at the town clock when I wanted to see what time it was. The casting reel of the South—the Milam, Meek or Talbot makes—are the products of fine workmen, jewelers originally, and are hand-made, costing from \$20 to \$30. In appearance they differ from the Eastern model of casting reel, but each model has its admirers, and I cannot presume to advise which any one should purchase.

Facilis est descensus. Dr. Neeley will fall faint with horror at the thought of laying out \$100 or so to catch a 13-cent fish. I did. We all did. We went and saved money and got cheap outfits, and then we got into the stream and got tangled up with a 13-cent fish, and after that it was all a dream. We do not remember how it happened, but somehow we let the question of shoes take care of itself, and we now have \$100 outfits. It is just this way: If a man's family gets hungry, the associated charities or the neighbors will do something for them, most always; but there are no associated charities, and no neighbor, who will give a man or his family a \$100 bass outfit. The duty of a man is, therefore, very plain, and duty should come before the mere pleasure of feeding one's folks, no matter how much fun it may be to see them eat.

If Dr. Neeley will forgive these broken remarks, and will spend what he (now) thinks he ought to lay out for a bass outfit; if he will get hold of a few soft-shelled crawfish, and put a few horny-handed helgramites in his hat in case the bass don't want minnows or frogs to-day, I know he will have a lot of fun with the big bass of the Tennessee. When he begins, let him not

AN EAST COAST TARPON.

be above bait. The fly-rod will be more sport after a time. I wish I might be of more service in giving the information which is asked, but with the books above named and with the guidance of *FOREST AND STREAM*, I am sure of Dr. Neeley's success, and I hope he will report his luck.

Defense of the Carp.

Mr. Nat H. Cohen, the enterprising president of the Illinois State Fish Commission, has just issued a concise little pamphlet for general distribution which is entitled "Fish Propagation and Protection." In it Mr. Cohen shows the value of the fish product of the State, and explains among other things how and why it is that it costs less to raise fish than to raise animal food on the lands of the State. The fish is cold-blooded, and does not perspire so much as a land animal, and when it eats anything it does it for revenue, and does not go charging around and wasting its fiber by inutilitarian exercise, as does the beef creature or the pig. Fish, as food, is not so sustaining as beef, but the difference of the total net results, considering the expense of raising both, is in favor of the fish. Mr. Cohen has a word to say for the down-trodden carp, which he says is all right if you know how to cook him, and if you get a good one, out of cool water. I fear that not even Mr. Cohen's honeyed words will reconcile us all to the shag-barked monstrosity from Deutschland, but there is no doubt that this little pamphlet is timely and useful. The people of America need a bureau of promotion and publicity, sure enough, in matters concerning our fish commissions and game laws. It is a great thing, this work of the Illinois Commission. Few have ever brought to it more enthusiasm than the present president of the board.

E. HOUGH.

1206 BOYCE BUILDING, Chicago, Ill.

Camp of Two Cranks.

Editor *Forest and Stream*:

I'll be beholden to ye if you will make a couple of corrections in "Camp of Two Cranks," in issue of March 19, page 223. In twenty-fifth line from top of first column read: "I waked up" for "waded up;" and in seventh line below read: "I had hooked on" for "I had poked on." And in "Camp of the Lone Kingfisher," issue Jan. 15, page 49, first column, cross out line 61 from top and prefix line 63 with "It would be a wonderful stream that would hold out" under a drain like that, etc.

KINGFISHER.

California Drought and Trout Streams.

AUBURN, Cal., March 28.—The present season in this State promises to be a disastrous one to all our interests from lack of rain. The trout must undoubtedly suffer unless we have abundant late rains, as all the smaller streams will dry up entirely. This happens to us occasionally, and it takes several years to restock the waters thus rendered barren.

AREFAR,

A Night Fight with a Tarpon.

ONE of the most hotly contested and thoroughly satisfactory fights between a man armed with a light rod and reel, and a tarpon in the fullest possession of his powers, that has ever come to my knowledge occurred in Biscayne waters last week. The date was March 23; the man was Mr. Fred H. Benton, of New Haven, Conn.; and the tarpon, who was 6ft. 8in. long, 3ft. 2in. around the body, and weighed 155lbs., was a resident of Caesar's Creek, a deep, narrow channel lying between Mangrove Island, beloved of all fishermen who know it, and forming the southern entrance to Biscayne Bay. A Vom Hofe rod and reel, 600ft. of No. 18 line, and a Van Vleck hook, formed important accessories to the struggle. A yacht, the *Susie B.*, of the Biscayne Bay Yacht Club; her dinghy, with Mr. Lewis Benton, her owner, to row it, and formally introduce his brother to the tarpon family, completed the tout ensemble. On returning from a cruise among the Florida keys the *Susie B.* came to anchor on Wednesday evening in Caesar's Creek, and the two brothers went out to fish while supper was preparing. Darkness was settling over the scene, and they were about to return to the yacht without having caught a thing, when Mr. Fred Benton, who had never before experienced a tarpon, suddenly became very much aware that a member of that family was in possession of his hook.

Right here it should be explained that although tarpon have swarmed in Caesar's Creek all winter, they had positively refused to take bait up to this time. Moreover, the present fish seems only to have made a playful snap

at Mr. Benton's lure, in passing; for the hook barely caught in his lower lip, where it may still be seen in the mounted specimen. Thus in the prolonged struggle that followed the strain of pulling it did not come on his inwards, as is the case when the bait is gorged, but on the powerful lower jaw, where it was hardly felt. This fact makes the fight in question particularly interesting.

As he felt the hook the great fish gave three tremendous leaps high in air, shaking his head savagely, and then started out to sea towing the dinghy behind him as though it were a toy boat. After awhile he changed his tactics and began a series of short rushes and counter rushes, leapings, rapid circlings of the boat, and darting to and fro directly beneath it. This was kept up for an hour, during which time the night became intensely dark, and a furious squall of wind and rain swept across the black waters.

At the end of that first hour the tarpon, still as vigorous as ever, decided to travel, and started up the coast. Up the whole length of Elliot's Key and past Sand's Key, a distance of more than six miles, he ran, making a break to fling himself high out of the water every few minutes as he went. Each time he did this the patient angler, standing in his boat, reeled in a few yards of line, only to lose all that he had thus gained a moment later when the great fish again started. Off the Ragged Rocks the tarpon again stood out to sea, crossing the broad Hawk Channel directly in the yellow gleam of Fowry Rock Light, and finally, beyond the outer reef, he was brought to gaff at 11:30 o'clock, or five and a half hours from the beginning of the fight.

As the monster lay alongside the little dinghy, barely discernible through the darkness of a second squall, which was at that moment howling down the reef, he appeared completely exhausted. The moment he felt the gaff, however, he showed a mighty reserve of strength, lashing the water into foam with tremendous struggles, thrashing the boat with his powerful tail until it seemed as though the sides would surely be crushed in, and taxing the utmost efforts of two strong men to finally drag him from his native element.

By this time both men were pretty well used up, their boat was half filled with water, the tarpon itself was no light load, and they were so many miles from their yacht that it was 3:30 o'clock the following morning before they regained her.

It is perhaps superfluous to remark that they were glad supper was ready; and a useless expenditure of ink to add that Mr. Fred Benton seems inclined to be proud of the tarpon he caught in the night. O. K. CHOBEE.

COCOANUT GROVE, Fla.

FOR SALE.—Hunting and fishing preserve in Adirondacks. 12,000 acres forest land; several fine lakes, 15 miles trout streams. Deer in plenty. 14 miles from railroad. A. A. Leonard, Knickerbocker Athletic Club, New York.—Adv.

The *FOREST AND STREAM* is put to press each week on Tuesday. Correspondence intended for publication should reach us at the latest by Monday, and as much earlier as practicable.

The Black Bass of Lake George.

Editor Forest and Stream:

In your issue of March 19, referring to inquiries by the State Legislature at Albany regarding the spawning habits of black bass in Lake George, where Hallock's Sportsman's Gazetteer, published in 1876, was quoted as authority, Mr. A. N. Cheney, who signs himself State Fishculturst (and therefore speaking *ex cathedra*, as one who ought to know, and not as the scribe), says:

"Mr. Hallock knew nothing about the fish in Lake George from personal knowledge, and when his book was printed little was known about black bass by any one."

Now, good sir, not being given to polemics, I will beg your kind permission simply to quote a passage in rebuttal from my "Fishing Tourist," published by Harper Bros. in 1873, several years earlier, which specifically says:

"Halcyon days have I passed at Lake George. What tongue has ever failed to sing the praises of its azure mountains and crystal depths? What artist has not transferred to canvas bits of its enchanting scenery?—the islets which gem the Narrows, the lovely seclusion of the Hague, or the sharply cut outlines of Elephant Mountain? Has he not even essayed to paint the hallowed stillness of Sabbath Day Point? Is not their name legion, and are not their cozy, vine-draped summer homes scattered along its romantic shores? Do they not nestle in its glens and shady nooks? * * * Many are the pounds of fish I have taken from Lake George; many the lakes I have raised with my trolling spoon from the buoys where old Moses (Harris) chummed his fish. Around the 300 islands of the Narrows and the peninsula of Tongue Mountain I have trolled for bass with rich success, and taken them time and again with my rod and an ibis fly from the rocks at the north end of Fourteen-Mile Island. And nearly all the trout streams in the neighborhood have paid shining tribute to my creel. Many a happy hour have I whiled away upon the lawn at Bolton, now studying delectable anatomy and physiology while the unconscious subjects played croquet, and anon reading my favorite book, or watching the little steamer that plied to and fro. In the quiet of its rural seclusion I envy not the artificial attractions of the grand hotel (Fort William Henry) at Baldwin, with its hops, its billiards, its brass band, its bar, its fast horses, its entremets, its flare and its flummery. I enjoy only things natural, and it is not without reluctance that I turn my back upon them when the hour for adieu comes; and all the eloquence of the "Colonel's" historical apostrophes to Ticonderoga and the American flag, with a sight of the bleached old ruins themselves, will not utterly banish my feelings of regret."

The Colonel was a character who always accompanied the stage loads of tourists which did the route between Fort Edwards and Ticonderoga, and expatiated upon the heroism of that fight, in which the redoubtable Ethan Allen was conspicuous. Old stagers will remember the Colonel. I don't think he was a sure-enough Colonel, as the Southern folks say, but he could talk war and patriotism all the same. My great-grandfather and a son who was born in 1766 were in that scrimmage and captured a Queen Anne musket from a Hessian, which is now in Goshen, Mass., where he lies buried, having died in 1815.

Now I am not in these days making history for myself, though I am jealous of historical truth. I am verging on old age, and such laurels as I have worn are sere and dry. Mr. Cheney may help himself from my pile if he thinks they are any worth, but he must concede to my score all points which I have earned. Indeed there was a time, during his adolescence, when he would cheerfully admit that I was born first, and had traveled some. But I have never cared to exploit my achievements, as younger men do to-day, though it might be pardonable to do so, because journeys occupied weeks in my best days which now take but hours; and an author had to be able to spare a good deal of money and much leisure time to be able to write such a book as the "Fishing Tourist" from his personal observation.

But twenty years before this I had visited Rev. John Todd at White Lake, in Sullivan county, in company with Joel T. Headly, and seen the notable Audubon and the Hermit of Long Lake in his cabin under the bluff when the Sabattis family were his only neighbors. Oh, yes! I know something of Lake George and its black bass from personal visits; and I thank my stars that my memory remains unimpaired, though my tongue may fail to speak of reminiscences and incidents of travel which may seem to me hardly worth mentioning in these days when the whole world is afield and moving.

CHARLES HALLOCK.

A Troutling Experience.

GRAND VIEW, Tenn., March 22.—*Editor Forest and Stream:* It is not all of fishing to fish, is a trite saying among fishermen, and it is not more trite than true, as I have often demonstrated that fact in my early fishing days.

I remember one day's fishing away back in my teens, and remember it because the circumstances attending it were unusual. We lived near the banks of a large trout brook, or creek rather, where were trout in abundance, which we caught with hook and line, mostly in the months of May, June and July. I always used lines that were made of hair pulled from three- or four-year-old colts' tails, and such lines were used in preference to any others that I ever found.

In those days fly-fishing was scarcely known in that sparsely settled country. The fishing day above mentioned occurred about the last of September or perhaps a few days later. The summer had been one of drought, and the stream had nearly run dry in some places; but there were occasional spring holes, or pools fed by springs, where the trout had gathered in countless numbers, and were considered proof against the most tempting baits of the fishermen. I had finished up trout fishing for the season as usual in July, and for three or four weeks past I had well nigh been laid up with a cut foot, and was yet stumping around on crutches, but I was getting uneasy, and wanted to get into the woods;

wanted to go down the creek. So I told my younger brother, a boy ten or eleven years old, to cut some white grubs out of an old decayed stump, and we started for the nearest pool down the creek, something over a mile distant, he carrying my fish pole and bait, while I followed after on crutches. We reached the spring about 10 A. M. The pool was a sort of set back from the creek, about 40yds. by 10 in diameter, and from 3 to 5 ft. deep, of clear, cold, spring water, and the clean gravelly bottom seemed to be literally covered with trout. The bank was shaded by some large elm and butternut trees, and a convenient log lay on the bank, which I appropriated at once. I wanted to take a dozen or so with hook and line, but remembering past experience I didn't feel over confident of success, nor even of getting a bite. But I had most of the day before me, and nothing else to do but to sit on that log and tamper with that finny multitude, and for two long hours I fished that spring hole from top to bottom, and from end to end, and nary a bite. I cast over on the opposite side, cast above and below, and they seemed totally indifferent to all my efforts, and I began to feel indifferent also; so I dropped the fish pole and lay down on the grassy bank, while the boy amused himself by throwing pebble stones into the pool. As I remember it, we had sat there on the grass a half hour or more, and were getting about ready to leave, I picked up my pole and carelessly made a cast over into the pool, when my bait was snapped up in a moment, and I pulled out a fair-sized trout. I made another cast, with the same result. I don't remember just how long I fished after they began to bite (probably an hour). I only know that I pulled them out as fast as they took the bait, and that they took the bait as fast as I could pull them out. The white grub has a tough skin, and I would often take a half dozen or more fish without rebaiting the hook. Well, I stopped fishing because I had got enough, and a little later on realized that I had more than enough. The trout sized up from ½ to ¾ lbs.; there were no fingerlings among them, and I think there were no minnows or chubs in the spring hole. Doubtless the larger trout had eaten up the small fry.

The fish were gathered up and strung on two strips of moosewood bark, and when the two ends of each string were tied together they made as fine strings of fish as I had seldom seen.

The boy hung one string over his back, which was all that he could carry, and the other string—well—should there be any one of the craft who believes that to fish is all there is of fishing, let him tie a 20lb. string of fish over his shoulder and travel home (a mile and a quarter) on crutches.

As to the cooking of brook trout, I suppose the most approved method is frying in butter or lard, or perhaps an occasional broil. It certainly is the quickest and most convenient way of cooking them, and especially so when in camp. Now without wishing to detract a whit from the prescribed rules of preparing this toothsome fish for the table, I would suggest an occasional change by a slight difference in the manner of cooking. The process is plain and simple, and is about as follows: First, take a square cut of thick salt pork, skin off the rind and cut the pork into thin slices. Then with a knife split the larger trout by cutting inside along the backbone, so they will lie flat. Then take the old-time bake kettle (which possibly may be laid aside as a relic of the past age) and cover the bottom with some of those slices of pork, which is to be covered with a layer of trout, then some more thin slices of pork; and with alternate layers fill the kettle if you have fish enough; but the top layer should be covered with slices of the pork. Then pour in a half pint of water or more, put on the lid and bake two or three hours in a hot oven; raise the lid and pour on a pint of melted butter and let it bake a half hour more with a slight decrease in heat; and when the whole mixture is brought to the table you have a dish that beats sardines or dry codfish clear out of sight.

The bake kettle can be used with success in the fireplace or in camp or in any place where live coals can be used in plenty.

ANTLER.

The Pleasures and Advantages of Fishing.

NEW HAVEN.—*Editor Forest and Stream:* Inclosed is an extract from "Days of Fly-Fishing," published in 1828 by Sir Humphry Davy. Upon reading it, it seemed to me to be in line with those admirable quotations from the "Compleat Angler" which you occasionally publish at the head of your editorial columns. If you can find space for this gem of description and for reflection in your paper the object of sending it will be accomplished, namely, to strengthen further that old truism, "It is not all of fishing to fish."

A. B. H.

THE search after food is an instinct belonging to our nature; and from the savage in his rudest and most primitive state, who destroys a piece of game or a fish with a club or a spear, to man in his most cultivated state of society, who employs artifice, machinery, and the resources of various other animals to secure his object, the origin of the pleasure is similar, and its object the same; but that kind of it requiring most art may be said to characterize man in his highest or intellectual state; and the fisher for salmon or trout with the fly employs not only machinery to assist his physical powers, but applies sagacity to conquer difficulties; and the pleasure derived from ingenious resources and devices, as well as from active pursuit, belongs to this amusement. Then as to its philosophical tendency, it is a pursuit of moral discipline, requiring patience, forbearance, and command of temper. As connected with natural science, it may be vaunted as demanding a knowledge of the habits of a considerable tribe of created beings—fishes, and the animals that they prey upon—and an acquaintance with the signs and tokens of the weather and its changes, the nature of waters and of the atmosphere. As to its poetical relations, it carries us into the most wild and beautiful scenery of nature, among mountain lakes and the clear and lovely streams that gush from the higher ranges of hills, or that make their way through the cavities of calcareous strata. How delightful in the early spring, after the dull and tedious time of winter, when the frosts disappear and the sunshine warms the earth and the waters, to wander forth by some clear stream, to see the leaf bursting from the purple bud, to scent the odors of the bank perfumed by the violet, and enameled as it were with the primrose and the daisy; and on the surface of the waters to view

the gaudy flies sparkling like animated gems in the sunbeams, while the bright and beautiful trout is watching them from below; to hear the twittering of the water birds, who, alarmed at your approach, rapidly hide themselves beneath the flowers and leaves of the waterlily; and as the season advances to find all these objects changed for others of the same kind, but better and brighter, till the swallow and the trout contend as it were for the gaudy fly, and till in pursuing your amusement in the calm and balmy evening, you are serenaded by the songs of the cheerful thrush and melodious nightingale, performing the offices of paternal love in thickets ornamented with the rose and woodbine.

SIR HUMPHRY DAVY (1778-1829).

The Bangor Salmon Pool.

BOSTON, April 4.—A special dispatch to the daily papers says that the salmon season at the celebrated Bangor, Me., pool opened April 1. Two fish were taken with the fly that day. One, taken by George Willey, of Veazie, weighed 18lbs.; another, by W. W. Fogg, of Bangor, weighed 9lbs. Both fish were sold at \$1.25 a pound. In 1897 the first fish was taken on April 3. Two or three Boston salmon fishermen will start for the Bangor pool early this week if the weather is favorable. Mr. H. S. Jones, who will be among the number, says that it is of but little use to fish there unless the weather is bright and fairly warm; the salmon will not come to the hook in water too dark. The pool is likely to be covered with boats, rigs of every sort, and tackle widely varied from a pole and a cod line to an outfit costing \$100. An early departure of the ice from Sebago Lake in Maine, is now looked for. A letter from a well-known guide to a sportsman here on Saturday says that the warm weather in March has melted the big body of snow that was on the ice, and that it has been honeycombed thereby, and is likely to go out any day when the wind is right. A big cleft has already appeared about midway on one of the shores, and running out as far as the eye can reach. Boston landlocked salmon fishermen are ready. Some of them expect to be off by Wednesday or Thursday of this week. Mr. R. P. Woodman, who has fished that lake every year for a number of years, expects to hook a big salmon by Thursday or Friday. One or two sportsmen are already on the ground, and will begin fishing as soon as the ice is out of the mouths of the inlets. The Boston Sebago Club, owning handsome camps on the shores of that lake, will be there in a body by the 19th, which is a legal holiday in Massachusetts, thus giving the busy dry goods men of that club an additional day that they can be away from business.

The little moose, Tom, that did so much to make the late Sportsmen's Show famous, is still "in transit" to Portland, Me. He has stopped off at Boston, and is being well fed and watered. Just how long this feeding and watering will be continued is not at all certain. The big black bear has gone to Norembege Park, at Newton; also a pair of elk, a couple of deer, the badger, and one or two of the prairie dogs.

SPECIAL.

A Fishing Privilege Opportunity.

HOSTEL OF THE GOOD SHEPHERD, SCRANTON, Pa., March 22.—*Editor Forest and Stream:* The Order of the Good Shepherd is an organization of men in the Protestant Episcopal Church who give their entire life in caring for the poor, sick and needy, who also have a small convalescent home for convalescent men and boys discharged from hospitals, and who have no homes to go to until fully recovered and able to go back to work. It has become essential to the success of our work that a place out in the country must be secured in order to do larger and more efficient work. A beautiful farm containing 400 acres of land has been offered to us at the low sum of \$3,000. The place consists of 408 acres of land, and has a large stream about a mile long, with three trout ponds well stocked; one large dam covers about sixty acres. The farm is about three miles from the railroad depot, on the main line of the D., L. and W. R. R., four hours' ride from New York city, 2,500ft. above the sea, in a situation free from malaria and mosquitoes. My propositions are these: Could some of your readers subscribe the \$3,000 toward the purchasing price of the property, on the condition that the stream and the ponds would be sacredly guarded and preserved for the subscribers of the fund as long as they would live? There is a large house on the place, containing thirteen rooms, with steam heat in each room, and entertainment could always be provided by the Brothers for those who should come to fish on the place. Also fathers and mothers could send their boys for an outing and feel perfectly safe that they would be under proper moral and religious influence in the midst of the most beautiful and inspiring scenery in eastern Pennsylvania.

The Order of the Good Shepherd is duly incorporated under the laws of the State to hold real estate for the purpose set forth in its articles of incorporation. I ask your kindly co-operation in our work for suffering humanity, and if your readers can do anything in regard to my proposition I shall feel ever grateful to you.

BROTHER FRANCIS.

Fishing at the Boston Show.

THE man who played fish for Dr. Bishop to reel in from the lake in the Boston Exposition was the well-known swimmer, Peter McNally.

Another angling feature not already noted in FOREST AND STREAM was the taking of a 2lb. trout from the trout pool by Mr. H. W. Martin, with one of his automatic reels, and using ordinary sewing thread for a line.

Early Spring in the Adirondacks.

SARANAC INN, N. Y., March 30.—For the first time within the memory of the oldest Adirondacker the ice has gone out of the lakes and ponds of this region in the month of March. Navigation is now open on the upper Saranac, one of the last lakes to open. Last year the ice broke up April 27. Until this year the earliest date on which the ice was known to go out of the lakes was April 15.—*Evening Post.*

Greenwood Lake.

NEW YORK, March 24.—*Editor Forest and Stream:* There have been put into Greenwood Lake during 1896-97 the following: 1,450 adult pike-perch and 2,000,000 fry; 28 white bass; 800 adult large-mouth black bass, 800 yearlings and 5,000 fry; 160 pickerel and 100 channel catfish.

The results obtained from planting pike-perch (wall-eyed pike) have been very satisfactory indeed. Schools of these fish 6 and 8 in. in length were frequently seen in the fall of 1897, and it is believed that they will form an important addition to the supply of food and game fish in the lake. Even better results may be expected from the planting of adult pike-perch, which have been so liberally supplied by the New Jersey Commission.

In their annual bill now before the Assembly at Trenton the New Jersey Commissioners recommend that the closed season for taking bass be extended until June 15. This law now being in effect in New York, it is important that the same legislation should be enacted in New Jersey, and it is hoped that club members will exercise any influence they may have with members of the Legislature at Trenton to secure the passage of the bill. The reasons are plain: Small-mouthed black bass cannot be propagated artificially. They are not off the spawning beds at Greenwood Lake by May 30, and consequently the taking of these fish before they are through spawning means a reduction of the supply of bass, which it will be impossible to replace. The best authorities on the question of propagating black bass are unanimous in their opinion that in waters where they have a sufficient food supply, as they have in Greenwood Lake, they cannot be fished out with a hook and line, if they are properly protected in spawning, and on the contrary they continue to multiply. As soon as the New Jersey Legislature has considered this question a meeting of the club will be called to secure the appointment of a warden in New York State to co-operate with the New Jersey officials in requiring an observance of the law in both States.

GREENWOOD LAKE FISH AND GAME PROTECTIVE CLUB,
L. F. La Roche, Treas.

Legislative Fooling.

SENATOR COGGESHALL introduced into the New York Legislature last week, and it was read twice and referred to the Committee on Naval Affairs, a bill to add to the fish law a new-section as follows: "Sec. 1099. No Spanish mackerel ever having inhabited any waters under the jurisdiction of the Spanish Government shall be permitted or allowed to enter the waters over which the State of New York has jurisdiction. Any Spanish mackerel entering or attempting to enter the aforesaid waters of the State of New York shall be deemed guilty of a misdemeanor, and shall be subject to prompt denotation at the expense of the Spanish Government. Sec. 2. This act shall take effect immediately."

The Kennel.

Treatment of the Horse.

MANY of us have much to say in your journal about dogs and other animals, but the horse has not seemed to claim much attention. I am not a turfman, and so do not speak in the interest of the horse racing fraternity. I am writing in the interest of the horse. The turfman is generally careful about the condition of his racer and needs no advice as regards his treatment and keeping. But others, as farmers, trucksters, draymen and such, are often found to exhibit a carelessness resolvable into most despicable cruelty. If such persons had any self-respect and did but know how contemptible they are in the eyes of the community in which they live, they would be no longer contented with half-starved horses that can hardly drag their own bony frames without having to haul heavy wagons and a well-fed driver sitting as complacent and unconcerned as one on a bed of roses. Shame! Noble, faithful beast—how many there are who can render an account only with grief whom you have served with sweat and blood and hunger! Shall I give them advice? Aye, indeed, if it be not useless.

First feed the horse well. If you are not disposed to do this, then just do penance yourself. Fast and fast and fast until you get a firm settled notion of how it feels to toil day by day on a morsel of food. Never over-tax him in work or in driving for pleasure. Never smite him when he stumbles—a man makes a fool of himself every time he does so. Some men, especially old men and country people, have a habit of constantly yanking or jerking the reins to make the horse walk faster, or as if they were afraid he was going to stop walking. Touch your horse slightly with the whip rather than do this. Imagine yourself with a bit in your mouth being constantly jerked; wouldn't you feel wonderfully relieved in having your tormenter let up on his senseless practice?

If I had my way the check-rein would be thrown "to the dogs." I have seen the horse—high-checked for some time—left standing that would turn his head upon his side and hold it there to rest the tired, aching muscles of his noble neck—suffering by the foolish pride of man!

Of balking, and I am done. Remember, a horse doesn't balk because he is vicious. The animal is to be pitied rather than blamed; and whatever must be done to induce him to move should not be done in anger. He is bound by some mysterious spell, against which his will power has no force, not at least until his mind is diverted from the cause that compels him to remain motionless. I said mysterious spell. This is to say, we do not know why he will not move. We can only conjecture. It may be that the impression has possessed him that the load is greater than he is able to move, which might be, as some suppose, the result of previous overloading or stalling, which he has not forgotten. But the case or reason seems to be different when the horse in traveling comes to a standstill or backs. To account for it I know not how; but I never will attribute it to perverse obstinacy.

I once owned a small Indian pony that would travel until he was almost too weary to ascend a hill, yet he never refused to keep steadily on his journey. But when taken out of the stable to be hitched to the wagon he would keep looking around as if something was wrong, especially if several persons stood by. When bidden to move he would back up. And when at length I succeeded in starting him he would make a plunge as if he had by a mighty effort of the will dispelled a horrible incubus that had held him, as man is bound by nightmare.

N. D. ELTING.

Yachting.

THE design which we publish this week may without much stretch of the imagination be called a "knockabout," in spite of her bowsprit, and in reality is more deserving of the name than most of the boats added to the class last year. Like the first of the Eastern knockabouts, the design is intended to combine cruising qualities and speed in approximately equal proportions. The knockabout type promises to make quite a strong and popular class about New York and the Sound this season, and to give some good racing; though the absence of any distinction between the original knockabout and its fin de siècle brother, the "raceabout," gives every advantage to the latter. The present design, if built to, is reasonably certain to make a thoroughly good boat for general work, however successful or the reverse in racing; and for the former purpose alone she will be worth all she costs, the construction being durable and substantial.

The design is capable of adaptation into an excellent 25-footer, this latter size giving full headroom and a very snug cabin, with room for one hand forward. We shall publish in the following issues the full specifications, offsets, sail plan and details of construction, and at the same time we will gladly give any further information concerning the design.

WITHIN the past week the steam yachts *Sovereign* and *Josephine* have been purchased by the Government, and taken to the Brooklyn navy yard for conversion to war purposes. Mr. M. D. C. Borden, owner of *Sovereign*, was unwilling to sell her, as she is a new vessel and admirably suited to his requirements; the price asked, in the neighborhood of \$400,000, was considered too high in the first negotiations, but the sale was finally made, presumably somewhere near this figure. *Josephine* sold for less than \$200,000.

Sovereign will be given a partial steel belt of $\frac{7}{8}$ in. plate, similar to *Mayflower*. It is reported that the Government has also purchased *Alcedo II.*, now at her builder's yard, for rebuilding. Dr. W. Seward Webb, owner of the steam yacht *Elfrida*, a craft costing over \$200,000, has offered her free to the Government. Mr. Howard Gould's offer of *Niagara II.* is also free; he proposes to turn the vessel over to the Government at any time, for use indefinitely, on the sole condition that she be returned to him in good condition when there is no further need for her.

A HANDSOME steam yacht was launched on April 2 at the Erie Basin Dry Docks, J. N. Robins & Co., for E. W. Bliss, of New York. She was designed by H. J. Gielow, and is 179ft. over all, 142ft. 4in. l.w.l., 20ft. beam, 6ft. 3in. draft, with triple compound engines, 14, 21, 24, 24 by 18, and two Roberts boilers. The work of construction has gone on quite rapidly, and the yacht will soon be completed.

Spray.

21ft. Fast Cruiser.

THE design here illustrated was made for Mr. J. W. Keogh, of Chicago, by W. P. Stephens, and the yacht is now partly completed at the yard of Rice Bros., East Boothbay, Me. She is not built to a racing class, but is intended for general sailing and cruising work of the knockabout sort on Lake Michigan.

She is named from a cruising canoe designed and built for Mr. Keogh by Mr. Stephens in 1881, and used for many cruises on Lake Michigan, Lake Erie and the Mississippi between that date and 1893, when she was destroyed by fire.

The design is practically a reduction, with some small changes, of that submitted by Mr. Stephens to the American Y. C. in its recent competition for a proposed 25ft. one-design class. The original requirements of this class, as stated by its promoters in the request for designs, called for a yacht of the general knockabout type, either keel or centerboard, of 25ft. l.w.l., and with a minimum of 6ft. clear headroom in the cabin, with about 800sq.ft. of sail in mainsail and jib, a short bowsprit being allowed. As to speed, the yachts were intended for racing only within the class, and while a lively and quick working boat was required, even in the light weather of the Sound, especial emphasis was given to the points of full standing room, good cabin accommodations, and ability to carry a full cruising outfit. As a matter of fact, after its first inception the movement took a different course, and in its final consideration of the seven designs submitted the committee made its selection solely on the basis of probable speed.

Owing to the shoal water on the anchorage grounds off Milton Point and in other of the North Shore harbors where the boats would lie, the committee from the first favored the deep centerboard type; but as the question of keel or board was left open to the designers Mr. Stephens elected to work on the former type. The design submitted was a study of the fast cruiser type on a l.w.l. of 25ft., speed and general accommodation being placed as nearly as possible on an equal basis by the designer. As a starting point in this work a very careful study was made of many known yachts of from 21 to 27ft. l.w.l., including all types from the racing fin-keels *El Chico* and *Wenonah* to the old Itchen boats such as the wide cutter *Daisy*, imported to this country in 1884, of excessive dimensions and displacement. The

dimensions, displacement, sail area and other elements of some twenty yachts, including *El Chico*, *Daisy*, the Stearns' *Seawanhaka* design and *Verona*, both enlarged, the old cutter *Yolande*, Mr. Hyslop's old *Petrel*, a reduction of the Burgess *Pappoose*, and other different craft, were tabulated in convenient form for comparison, and the midship sections of some of the best representatives of each type were plotted over each other to the same scale. These examples, in some cases reduced or enlarged to the standard length of 25ft., showed a range in displacement of from two tons to nearly nine, in area of midship section from 5sq.ft. to over 22; in beam, excluding the very wide centerboard type, from 6ft. 6in. to over 9; in draft from 4ft. 10in. to nearly 7ft., and in sail area (two lower sails) from 600 to 900sq.ft.

After a very careful consideration of these data the following elements were selected as the basis of the design: L.w.l., 25ft.; beam, extreme, 8ft. 10in.; at l.w.l., 8ft. 2in.; draft, 5ft. 6in.; depth from floor to top of plank-sheer, 4ft. 5in.; area of midship section, 17.50sq.ft.; displacement, 6.60 long tons, (sail area, 800 to 850sq.ft. The figure for the midship section was selected as the least which would give reasonable internal room with a moderate freeboard and low house, and similarly the displacement was cut to the minimum consistent with some length of floor forward and aft. The figure for the draft, 5ft. 6in., was selected as the lowest admissible for fair performance in a keel boat; to be increased if allowed to 5ft. 9in. or even 6ft.

In accordance with these figures the accompanying midship section was drawn to give a good form with the best possible average of essential internal dimensions, headroom of 6ft. not merely at one point, but over a good length of floor; "footroom" a floor of 2ft. width by as long as possible, and yet permitting a good transom locker; full headroom over locker to sit erect under

SECTION OF PROPOSED 25-FOOTER.

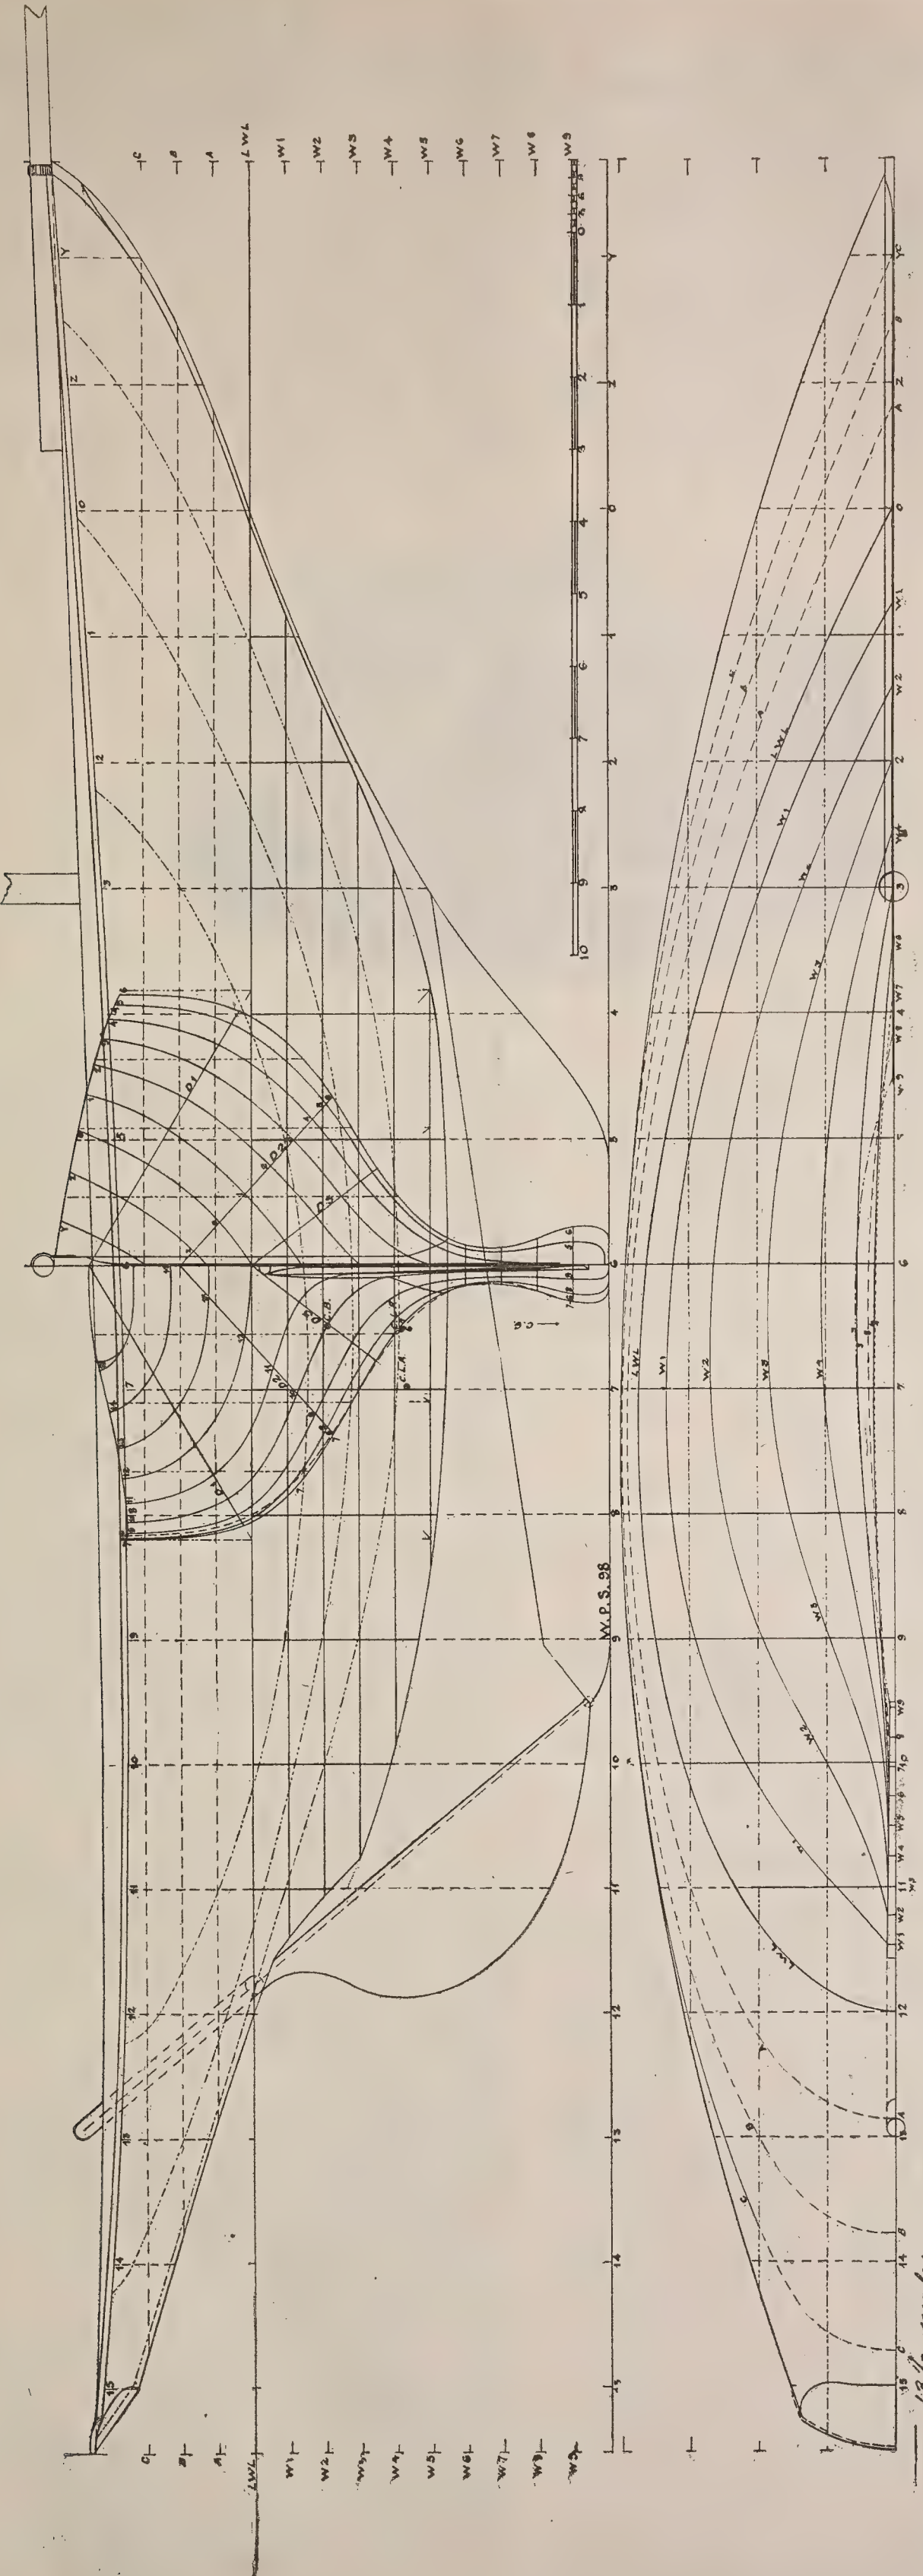

deck; a low house, but 12in. at side, and with little crown to roof, wide enough for two persons to stand and pass easily, and yet giving a good side deck, 2ft. 8in.; and as much freeboard, 25in. at lowest point of plank-sheer, as could be carried into the ends without too much top weight and a clumsy appearance. The design finally showed a floor 2ft. wide for a length of 9ft., with full 6ft. headroom under beams for a length of 8ft.; a cockpit 7ft. long and 3ft. 6in. wide, with seats on deck inside a coaming 8ft. 7in. long and 5ft. 6in. wide; and a low house 10ft. long, its highest point being but 3ft. 11in. above the l.w.l. With a fairly full l.w.l., and the full round diagonals made possible through modern long ends, the design promised a very great improvement in speed over all the older boats, and at the same time an amount of internal room quite equal to that of even the cruisers. One point to which much attention was given from the first was the preservation of a relatively large boat in the water compared to the boat in the air, both in top-sides and house, with a view to preserving a thoroughly shipshape and yachty appearance and the avoidance of high weights and unnecessary windage.

In reducing this design from 25ft. to 21ft. l.w.l., some changes were made in deference to the wishes of Mr. Keogh, and the conditions also became slightly different, as it was no longer possible to obtain 6ft. headroom, and the proposed uses of the owner made cabin space of less importance as compared with speed. The draft was increased to 5ft., equivalent to 6ft. in the 25-footers, and the sections were cut away below the floor, the keel being bulbed still more. The dimensions of the 21ft. design are:

Length, over all	32ft.
Length, L.W.L.	21ft.
Overhang, bow	4ft. 10in.
Overhang, stern	6ft. 2in.
Beam, extreme	7ft. 8in.
Beam, L.W.L.	7ft. 2in.
Draft	5ft.
Freeboard, least	1ft. 9in.
Sheer, bow	1ft.
Sheer, stern	5in.
Displacement, salt water	4.00 long tons.
Displacement, per inch immersion	576lbs.
Displacement, coefficient	0.53
Iron keel, calculated weight	1.73 long tons.

Midship section, area	12.60sq.ft.
Midship section, coefficient	0.35
L.W.L. plane, area	107.75sq.ft.
L.W.L. plane, coefficient	0.71
Lower plane, hull, area	67.72sq.ft.
Lateral plane, rudder, area	8.05sq.ft.
Lateral plane, total	75.77sq.ft.
Lateral plane, coefficient	0.72

Station O to center of L.W.L.	10.50ft.
Station O to midship section	11.60ft.
to coefficient	0.55

SPRAY. 21FT. L.W.L., DESIGNED FOR J. W. KEOGH, ESQ., BY W. P. STEPHENS, 1888.

Station O to C. B.	11.37ft.
to coefficient	0.54
Station O to C. L. R., with rudder	12.18ft.
Station O to C. L. R., without rudder ..	11.41ft.
to coefficient	0.58
to coefficient	0.54
Station O to C. E.	11.00ft.
C. B. below L.W.L.	1.125ft.
C. E. above C. L. R. of hull	17.50ft.
Mainsail, area	465sq.ft.
Jib, area	140sq.ft.
Total area	605sq.ft.
Sail area, square root	24.60ft.
Racing measurement	22.80ft.

Mast, from Station O	5ft.	3in.
Mast, heel to truck	32ft.	6in.
Mast, deck to hounds	28ft.	
Mast, diameter in partners	5in.	
Bowsprit, Station O to cranse iron	8ft.	
Bowsprit, heel to cranse iron	6ft.	8in.
Bowsprit, gammon iron to cranse iron ..	3ft.	2in.
Bowsprit, diameter at gammon iron	3½in.	
Boom, length from after side of mast ...	25ft.	
Boom, diameter in slings	4in.	
Gaff, length	15ft.	
Gaff, diameter	3in.	
Mainsail, hoist	19ft.	
Mainsail, leach	35ft.	7in.
Mainsail, tack to peak	33ft.	
Mainsail, clew to throat	30ft.	6in.
Jib, luff	26ft.	
Jib, leach	22ft.	3in.
Jib, foot	12ft.	6in.

In the calculation of displacement, etc., as above, the rudder was included as part of the hull, being continuous with it. The dimensions of the sail plan assume that the sails are fully stretched to the limit of the spars, the allowance for stretch being left to the sail maker.

With a final adjustment of L.W.L. and sail area to the even figure of 22ft. R. M., the design complies in all respects with the limitations of the 22ft. class on Lake Ontario, and with the rules of the Y. R. U. of the Great Lakes. The coefficient of midship section, 35 per cent., is up to the limit of the larger classes. The original dimensions, of 25ft. l.w.l., etc., would make an excellent 27-footer, complying with all the limitations of the Lake rules as to measurement, coefficient, draft, etc. The details of construction, offsets, scantling, etc., will follow next week.

Measurement Rules.

NEW YORK, March 22.—*Editor Forest and Stream:* Let us consider the measurement rule proposed by J. E. in FOREST AND STREAM of March 19:

$$L_r = \frac{Sg.}{Kg.} \times L \times 8 \text{ (or } 10) \sqrt{M.}$$

Sg. (see Fig. 1 and Fig. 2). The girth is measured around the perimeter from rail to keel, following the skin. Kg. (see Fig. 3). The measurement is made in this case along the straight line.

L.—The L.W.L. length.

M.—The righting moment. Measured at 7½ degrees for large yachts and 15 degrees for small yachts.

First: Consider the factor $\frac{Sg.}{Kg.}$. This factor evidently can never be less than unity, since Kg. is the shortest line that can be drawn between the rail and keel (see Fig. 3). No matter whether the designer uses

the full section, Fig. 1, or the extreme fin section of Fig. 2, the effect on the factor is precisely the same, and naturally then the designer would use the fin section, since that has much less displacement and much less wetted surface, the effect being to secure the boat of very small capacity. He might use a section similar to that shown in Fig. 3, the effect of which would be to produce an extremely bad type.

Second: L. is measured on an even keel, therefore the designer would use that form which would give a

considerable increase of L., with increased heel and a decrease of actual beam. This also would tend to the using of the fin-keel section.

*Third: The righting moment is used.

(a) Considered alone, righting moment or ability to carry sail has always been considered a desirable quality in a yacht, and it is only undesirable when obtained by use of excessive draft combined with small displacement. Any rule, then, which taxes righting moment, leaving sail unrestricted, is vicious in the extreme, since it would encourage the building of yachts with small righting moments and large rigs.

(b) The requirement of the small righting moment for the small angle of heel given can easily be met and evaded, either by the use of the semi-circle section of fin-keel for large yachts or by the use of such a section as is shown on Fig. 4, in which by an adjustment of the weight of the topsides and hull to the weight of the keel the righting moment for either 7½ degrees or 15 degrees can be made 0, while at 45 degrees it will be sufficiently great to permit a fair amount of sail to be carried. Using such a section as is shown in Fig. 4, the girth factor would be small, the length would be

"The Canarsie side-wheeler steamed past."

extremely short, the lineal rating very small, and the resulting yacht reasonably fast and very bad.

(c) Taking a fin-keel of circular cross section, the ratio of righting moments for various degrees of heel, disregarding the effect of the spars, is as follows: 7½ degrees, 1; 15 degrees, 2; 22½ degrees, 3; 30 degrees, 3.8; 37½ degrees, 4.7; 45 degrees, 5.5.

For an angle of heel of 7½ degrees, figuring in the weight of the spars, the righting moment would be decreased to about one-half. The designer therefore would naturally design a large yacht to use a high angle of heel. I may be wrong, but it seems to me that it would be difficult to suggest a more thoroughly bad rule than this one.

GEO. HILL.

Memories of Boating Days.

(Continued from page 271.)

We had just finished giving her a finishing coat of black outside. Her interior was all newly decorated, all bright wood, such as rails, doors, skylight, etc., freshly varnished, and we went home leaving her wide open that the paint inside would dry better. That night the blizzard began. After it was over we dug her out, and of course had all our work to do over again.

In spite of this setback she was launched on April 1, and we set sail for our summer quarters at Sheepshead Bay. When in the Upper Bay it came on to snow, and the weather looked so bad that we ran into Tompkinsville, S. I. One of the crew was acquainted with the firm of Schmidt & Pannick, boat builders at this place, and we were entertained for a couple of hours viewing their models and pictures of sailing craft.

At 5 o'clock P. M., the storm showing no symptoms of letting up, we double-reefed and ran across to Gowanus Canal and tied up at Downing & Lawrence's wharf near the dry docks. The following week we took her around with a fine northwest wind, and only two hours were occupied in making the run.

The cruising fever got hold of us again this summer, and for a wonder we agreed as to where we should go, the result being that we spent a delightful week on the waters of Great South Bay, an account of which was published in this paper in 1889. Another short cruise over along the Jersey shore followed the next month, the recollections of which are so pleasant to myself that I cannot refrain from giving a brief description of the trip.

A stiff sou'wester was throwing the surf up on the beach opposite Sheepshead Bay when we arrived one morning where our yacht lay tugging at her moorings, as though trying to pull a stone weighing over 100lbs. out of the mud, where it lay sunk to the depth of several feet.

There were four of us, all thoroughly prepared for a week of knocking about. Two were what may be called passengers or invited guests—Mr. R., representative of the British Isles; and Dr. C., of Brooklyn, in search of health. Then there was my big brother, who commands the ship, and lastly myself, on whom the responsibility of crew and steward were showered on this occasion.

Our skiff or tender, as we generally speak of this useful appendage to a yacht, was lying alongside the float, and into it we threw our baggage and then stepped in ourselves. We shoved off to where Monaitpee was tossing her head up and dancing around, as though anxious to be let loose.

If our boat had been a deep draft, well-ballasted keel, instead of a lightly trimmed centerboarder, we would have braved the tempest outside, and got to Keyport that day; but not being such we simply tied in two reefs and scudded down to Richard's Point, a place effectually

sheltered from the waves, but not from the wind. Here we intended to have a try at the blackfish and small sea bass. We had not been anchored five minutes when we were dragging the mud hook and going on to the bank. Up went the mainsail, and heeling over with lee deck all under she ran up the wind faster than we could get the rods on deck. When quite near the windward bank we let go and settled back until about twelve fathoms of cable had run out, then she held on. Here we lay all afternoon, but instead of letting up, the gale increased, and even in our sheltered harbor the water was a mass of lather and flying spray. We caught a good mess of fish, among which were some kingfish, which weighed about a pound each, and made a good fry for supper.

The sun was settling down amid a mass of crimson and breezy looking clouds when the captain, getting out into the cockpit, shouted defiantly: "This boat's going through to Rockaway to-night or bust."

Well now that suits us. Rockaway it is. The crew bounced out on deck and began preparations for getting under way. Shortening up on the anchor rode, we ran up the reefed mainsail, then tripping the "killick" up went

the corner of jib. Obedient to headsail she filled away and headed out Dead Horse Channel with the wind almost abeam. Looking down from our elevated position on the windward rail we could plainly see the centerboard cutting and slashing through the green water, while her red bottom shone like gold under the last rays of old Sol.

Rounding the stake at the end of the channel we squared away for our destination. Running directly before the wind the jib was useless, so we stowed it. "Why this is not so bad!" Mr. R. shouted. "Now if it wasn't so blooming dark—whew!" His words were cut short by a shower of water which just then came flying over all hands. The skipper perceiving the sandbar opposite Barren Island close under the lee bow had suddenly hauled on the wind to clear the outer edge of it, which was distinguishable by the whiteness of the water, where the waves were tumbling in confusion about it. Coming broadside on to the sea a wave slapped up against the side and dropped itself upon our British passenger. "If it wasn't so dark," repeated the doctor, and I from my position forward perceived by the light of the cabin lamp which shone out through the partly open scuttle near where he was sitting that a fiendish smile distorted his otherwise placid features.

With the going down of the sun the gale had lessened somewhat, but when darkness set in it began again with renewed force. I looked over the bow; her horn was pitching into the black billows as though in defiance, and would scatter them from her path, while under the stem the water bubbled and surged up, sometimes coming over the rail on deck 2in. deep. I was hanging on to the windward shroud, which was as taut as a bow string, and vainly endeavoring to pierce the gloom ahead, where some faint glimmering lights were discernible, when a shout from my brother startled me.

"Let go the peak, quick!"

I had the slack of the halyard in one of my hands, and just as a gust of wind struck us like a battering ram I gave a yank at the rope, which was always belayed with a hitch that could be let go by a jerk at the loose end. Down it came, letting the bagging leech trail in the brine, and she made a lunge forward as though to take a header. Indeed she did, being extremely thin and sharp bowed she is always wet forward, and this time the water came over the deck in a solid sheet, a large quantity of which flowed into the forward cabin port-hole, which we had neglected to fasten down.

With the dropping of the peak and the heeling of the yacht the main boom was now trailing in the waves to leeward, and the captain not liking this sung out to run up the gaff again. Up it went, and away she flew with the canvas stretched and bellied around the rigging until it seemed as though the wire backstay would come through the cloth. The squall had only eased up a little when we saw the lights and heard the throbbing of a steamer coming down directly in our wake at the same moment the sharp blasts of her whistle came to our ears.

"She's going to leeward of us, steer to port!"

"All right; port it is." Down went the stick, and we shot across toward the north side of the channel, while the Canarsie side-wheeler steamed past, looking like a fiery palace.

In our endeavor to get out of the way of the steamer we ran too far onto the shoal which extends along the north side of the channel, and Monaitpee began to drag an enormous wave up behind and seemed about to stand still and let it come tumbling on deck. Jamming the tiller to port she soon fell away, and at a great risk of jibing got back into deep water. We were now directly back of the big Rockaway hotel, and in a very few minutes reached the pier where we were to land. We saw some people on board the steamboat which was

lying at the wharf gaze at us in astonishment as we suddenly loomed up out of the darkness, and shot around the pier head, letting the mainsail come down on the run as we rounded up into the shelter of the structure. Putting out a bow and stern anchor we secured the boat, so that it would be impossible for her to pound against the piles; then getting into the tender we pulled ashore to a landing place, where we made fast the skiff and proceeded to see the sights.

The place was in full blast, and the sounds of music and song came from all quarters. We spent the evening seeing the different variety of exhibitions. At about 11 o'clock we went on board and stowed in for the night.

A delightful breeze is blowing from the westward when we crawl on deck about 6 o'clock next morning. The sky is clear and there is every prospect of a fine day, and we hasten to take advantage of it by getting under way. With the intention of having a try at the weakfish near the Hospital Islands off Staten Island, we had brought along some bait for that purpose, which we began to fear would be spoiled before we could use it. After beating down to Rockaway Inlet the wind began to subside, and we set the clubtopsail. Standing along shore inside Dry Bar we went about in front of the Oriental Hotel, Manhattan Beach, and reached well out toward the Roamer Shoals on the next tack. From here we fetched Coney Island or Norton's Point. Making a short hitch across the channel we laid our course up along the west bank toward Fort Tompkins.

We had been an unreasonable long time in getting over here, and it was while we were rolling and pitching about at the mercy of the sort of tide-rip that makes across the East Bank Shoals that we endeavored to eat our noonday meal.

The wind had almost entirely died out, and the tide being on the ebb we instead of making any headway were being set back stern first, and rolling unmercifully in the sloppy waves. Every now and then her bow would drop down with a thud, and a wave which was always ready would roll over the stern on deck and run along each side of the cabin and pour over the counter into the sea again.

As I was saying it was here we undertook to eat, seeing we could do nothing else. The doctor got into the cabin to carve a piece of roast mutton, but shortly after entering came on deck while a ghastly pallor o'erspread his face. We smiled as he began "chumming" for bluefish, and the captain suggested throwing out a squid. Mr. R. somehow disliked to make an attempt where the doctor had failed, so I dropped down through the scuttle and performed the operation. The doctor lost the number of his mess that day, and could eat nothing until late in the afternoon.

During the meal the breeze set in again quite fresh, and after getting across near the bell buoy, a little below Swinburn Island, we made short work of the intervening distance between us and Fort Tompkins. There were quite a number of boats fishing around the locality, and dropping the anchor we prepared to join them in their piscatorial endeavors. But, alas! our bait, the poor shrimps, in spite of the care we had taken to keep them alive, had given up the ghost, and all that remained was a mass of colorless looking things that would scarcely hold together to be put upon a hook, even though they had been of any account. We had some clams aboard, and we got some drop lines out for bottom fish, but only succeeded in capturing a skate and one or two dogfish.

About 2 o'clock we started across the Bay for Keyport with topsail breeze, although quite squally. The wind came from the westward, and hauling down sheets we stood toward the Jersey shore on the starboard tack. It was in the neighborhood of 5 o'clock when, having ran well in between Point Comfort and Conoskonk Point, we went about, having made about twelve miles on one reach. Standing up along shore in company with a large fleet of oyster and clam boats, we rounded Conoskonk Point, and keeping the steamboat channel ran in and came to anchor at Keyport. During the evening we visited the town, where the doctor, after finding a telegraph office, proceeded to inform his newly acquired better half that he had escaped the perils of the deep and arrived safely in port.

In the morning we had occasion to make several trips ashore in the small boat, and upon returning to the place where we had landed, without exception every time we found that some natives had calmly launched our tender and were using it either to go on board some craft or to raise an anchor and tow a boat into the beach, being no way particular about how much mud they distributed over the thwarts during the operation. Mr. R. and I had taken the tin coffee-pot and gone ashore for some beer. Upon returning we found as usual our boat had disappeared. Looking about we perceived a red-headed youth rowing out toward a catboat anchored about rooyds. from shore.

"Where are you going with that boat?" I yelled, thinking that it was about time to make some objection to this kind of business.

"I'll be back right away," said he, proceeding to raise the anchor that held the catboat. Having succeeded, he threw it on the seat in the stern, mud and all, and taking the oars pulled into the beach. Landing, he stepped out, leaving the oars in the rowlocks, and began looking after his own boat.

"Did you ever see such blawsted impudence?" cried Mr. R., wrathfully, and he began to berate the boy at a great rate, getting extremely red in the face with indignation. But the red-haired youth seemed unconscious of his wrath, not deigning to look up from his occupation, and perceiving that he was wasting his breath to no purpose we got into our skiff and pulled out to the yacht and proceeded to drown our anger with the contents of the coffee-pot.

Just as we were about to start out a boy came alongside sculling a large ship's boat, almost as large as Monatipee. He was about twelve years old, and was standing on one of the seats in order to work the boat with a 12ft. oar. We were laughing at the endeavors of the boy to propel the enormous craft, when he hailed us, asking for the doctor. That gentleman answering, a telegram was handed him by the messenger. Tearing open the envelope, he cast his eyes over the sheet, and a happy smile illuminated his features.

"Hurrah, boys! she says I can stop for the whole week," and he began dancing around the cockpit, for-

getting that the boy was waiting alongside for further orders until reminded by the captain.

"No answer, boy," said he. "Oh, here—that's for yourself," handing him a coin.

The Fin-Keel and Scow Types.

CHICAGO, March 28.—*Editor Forest and Stream:* In your issue of March 26 Mr. George Hill presents two designs, one of a full-bodied fin and the other of a shoal-bodied boat which he dubs a "freak." The comparison shows clearly the advantage which the latter would have over the rational boat when measured by the sail area and length rule. Reference is made to the sail area and girth rule given in my communication in your issue of Feb. 12, and Mr. Hill implies that under this rule also the "freak" would have the advantage if made without a fin. In order to throw light on the matter I have calculated the ratings of his two designs, using 5,000 as a divisor:

$$\text{Rating} = \frac{\text{Sail area} \times \text{girth}}{5,000}$$

$$\text{Rating of full-bodied fin} = \frac{480 \times 19.33}{5,000} = 185.$$

$$\text{Rating of Freak} = \frac{840 \times 22.72}{5,000} = 3.32.$$

The girth is the tape line measurement from waterline to waterline plus the greatest breadth. The "freak" is measured without the fin. The rating of "freak" is over double that of the "full-bodied fin," or reduced to linear rating the "freak" would measure 25 per cent. longer than the other.

In view of these figures Mr. Hill's comment is inexplicable.

JAMES N. WARRINGTON.

Knockabouts on Long Island Sound.

THE Indian Harbor Y. C., in its efforts to encourage the knock-about fleet on the Sound has sent out the following letter to members:

Members intending to purchase or build boats for the coming season are particularly requested to look into the merits of the 21ft. restricted knockabout class, which is being promoted by this club, and if possible to acquire boats coming within its limitations. These boats can be acquired at a moderate cost, and they can be maintained with but little expense. Some orders have already been placed, and in the belief that this should make a most interesting and desirable class, both for racing and cruising purposes, the regatta committee desires to secure the hearty co-operation of the members in making these boats a special feature in the club's events during the coming season. A number of boats which come within the limitations of this class can now be purchased, and any members who desire to build for the class can have their boats delivered within six to eight weeks of the time of placing the order. The rules covering this class have already been distributed among the members.

The work of altering and enlarging the club house, whereby dining and grill rooms are to be added and additional kitchen and storage accommodation secured, is progressing rapidly, and will be completed before May 1. While the house will be open to members shortly after that date, the formal opening of the club will not take place until about the end of May, regular notice of which will be sent to the members in due time.

The Regatta Committee announces the following events for the season: Monday, May 30 (Decoration Day), special race; Tuesday, June 28, circuit race; Saturday, July 30, annual regatta; Saturday, Sept. 3, fall race.

A. C. A. Membership.

APPLICATIONS for membership may be made to the purser of the division in which the applicant resides on blanks furnished by purser, the applicant becoming a member provided no objection be made within fourteen days after his name has been officially published in the FOREST AND STREAM.

Eastern Division.

Robert J. Bowie, 204 High street, Lawrence, Mass.
Frank M. Seamans, 43 South street, Boston, Mass.
James S. Thorndike, 147 Main street, Brockton, Mass.

Trap-Shooting.

Fixtures.

April 7-8.—Platte City, Mo.—Annual spring tournament of the Platte City Gun Club. S. Redman, Sec'y.

April 8.—Bridgeport, Conn.—Target tournament of the Bridgeport Gun Club. J. G. Kingsbury, Sec'y.

April 13-15.—Atchison, Kans.—Manufacturers' fourth annual amateur tournament; \$500 cash added; \$50 high average. Jack Parker, Manager; Lou Erhardt, Sec'y.

April 13-15.—Macon, Ga.—Tournament of the Interstate Association, under the auspices of the Macon Gun Club. F. C. Etheridge, Sec'y.

April 14-15.—Newburgh, N. Y.—Special shoot, Hudson River Trap-Shooters' League, on grounds of Glenwood Gun Club. J. B. Rogers, Manager.

April 15.—Worcester, Mass.—Tournament of Massachusetts State Shooting Association, under the auspices of the Worcester Sportsmen's Club. A. W. Walls, Sec'y.

April 18-20.—St. Louis, Mo.—Tournament for amateurs only at the Du Pont shooting Park, under the management of J. A. Corry.

April 19.—Brockton, Mass.—All-day shoot for merchandise prizes, first of weekly series. B. Leroy Woodard, Manager.

April 19-21.—Lincoln, Neb.—First annual amateur tournament of the Lincoln Gun Club. Each day \$50 added to the purses. Geo. L. Carter, Sec'y.

April 27-28.—Peru, Ind.—Second annual amateur tournament. Jack Parker, Manager. Address all communications to J. L. Head, Peru, Ind.

May 4-5.—Brunswick, Ga.—Tournament of the Interstate Association, under the auspices of the Atlantic Gun Club. J. H. Polhill, Sec'y.

May 4-6.—Newburgh, N. Y.—Trophy shoot, Hudson River Trap-Shooters' League, on grounds of Newburgh Gun and Rifle Club. J. B. Rogers, Manager.

May 10-11.—St. Cloud, Minn.—St. Cloud Gun Club's amateur tournament. E. S. Hill, Sec'y.

May 10-13.—Des Moines, Ia.—Charley Budd's shoot. First three days, targets; \$350 added. Fourth day, live birds; 25 birds, \$25, handicap, \$50 added.

May 16-21.—Kansas City, Mo.—Annual tournament Missouri State Fish and Game Protective Association. G. M. Walden, Pres., Kansas City.

May 17-20.—Newark, N. J.—Tournament of the New Jersey State Sportsmen's Association, on the grounds of the East Side Gun Club. T. H. Keller, Sec'y.

May 18-19.—Crawfordsville, Ind.—Tournament of the Crawfordsville Gun Club. C. E. Lacy, Sec'y.

May 18-20.—Waterloo, Ia.—Annual tournament of the Waterloo Gun Club.

May 24-27.—Omaha, Neb.—Twenty-second annual tournament of the Nebraska State Sportsmen's Association. F. S. Parmelee, Sec'y.

May 25-26.—Wilmington, N. C.—Tournament of the Interstate Association, under the auspices of the Eastern Dog and Game Protective Association. H. McL. Green, Pres.

May 30.—Canajoharie, N. Y.—Decoration Day shoot of the Canajoharie Gun Club. Targets. Charles Weeks, Sec'y.

June 1-2.—Peekskill, N. Y.—Trophy shoot, Hudson River Trap-Shooters' League, on the grounds of Peekskill Gun Club. J. B. Rogers, Manager.

June 2-3.—Alton, Ill.—Second annual bluerock tournament of Piasa Gun Club. F. C. Riehl, Sec'y.

June 7-8.—Ottawa, Kans.—Annual tournament of the Kansas State Sportsmen's Association. W. L. Beardsley, Sec'y-Treas.

June 7-8.—Indianapolis, Ind.—Annual tournament of the Indiana Trap-Shooters' League, of Indiana, on the grounds of the Limited Gun Club.

June 8-9.—Findlay, O.—Annual tournament of the Magautrap Gun Club. O. B. Marvin, Sec'y.

June 8-10.—Parkersburg, W. Va.—Second annual tournament of the West Virginia State Sportsmen's Association. Address all communications to Ed O. Bower, Sec'y, Sistersville, W. Va.

June 14-15.—Stillwater, Minn.—Tournament of the Stillwater Gun Club.

June 15-16.—Portsmouth, Va.—Tournament of the Interstate Association, under the auspices of the Portsmouth Gun Club. W. N. White, Sec'y.

June 15-17.—Cleveland, O.—Fifth annual tournament of the Cleveland Target Co. Bluerocks thrown free of charge. Professionals and manufacturers' agents barred from programme events.

June 20-24.—Rochester, N. Y.—Annual tournament of the New York State Association, under the auspices of the Rochester Rod and Gun Club. Live birds and targets.

June 21-23.—Sioux City, Ia.—Fourth annual amateur tournament of the Soo Gun Club. Three sets of traps. W. F. Duncan, Treas.

June 23.—Minneapolis, Minn.—Tournament of the Minneapolis Gun Club. G. J. McGraw, Sec'y.

June 27-July 3.—Milwaukee, Wis.—Tournament of Milwaukee Gun Club, carnival week. Live birds and targets. \$1,000 added money.

July 1.—Sherbrooke, Canada.—Grand annual tournament. Targets. Regular sweeps, variety and merchandise. C. H. Foss, Sec'y.

July 6-7.—Meadville, Pa.—Tournament of the Interstate Association, under the auspices of the Meadville Gun Club. Chas. Stein, Sec'y.

July 14-15.—Poughkeepsie, N. Y.—Trophy shoot, Hudson River Trap-Shooters' League, on the grounds of the Poughkeepsie Gun Club. J. B. Rogers, Manager.

July 19-21.—Palmyra, Mo.—Eight annual tournament of the Missouri Amateur Shooting Association, under the management of the Palmyra Gun Club. Targets and live birds. Added money announced later. W. N. Bates, Sec'y.

July 27-28.—Meriden, Conn.—Tournament of the Interstate Association, under the auspices of the Parker Gun Club. C. S. Howard, Sec'y.

Aug. 10-11.—Marlborough, N. Y.—Trophy shoot, Hudson River Trap-Shooters' League, on grounds of Marlborough Gun Club. J. B. Rogers, Manager.

Aug. 17-18.—Waterville, Me.—Tournament of the Interstate Association, under the auspices of the Waterville Gun Club. E. T. Wyman, Sec'y.

Sept. 7-8.—Haverhill, Mass.—Tournament of the Interstate Association, under the auspices of the Haverhill Gun Club. Geo. F. Stevens, Sec'y.

DRIVERS AND TWISTERS.

Club secretaries are invited to send their scores for publication in these columns, also any news notes they may care to have printed. Ties in all events are considered as divided unless otherwise reported. Mail all such matter to Forest and Stream Publishing Company, 346 Broadway, New York.

In respect to the high scores made on the first day at Reading, one of the contestants informs us that the true explanation is that, first, the ground at the score was appreciably higher than the magautrap, so that the shooters had a good view of the target a moment after it left the trap. Second, the first day was rainy, so that the coloring and shading of the background was all that could be desired in the way of contrast with the targets, they being sharply distinct throughout their flight. With clearer weather came the changes of color which made the targets more or less indistinct against the background, and the targets also were thrown faster, which made a general falling off in the scores. The increased speed alone, however, would not have made so much difference.

Mr. David Brown, Newburgh, N. Y., writes us as follows: "On May 4 and 5 the Hudson River Trap-Shooters' League holds a target tournament on the grounds of the West Newburgh Gun and Rifle Club. On the 6th the West Newburgh Gun and Rifle Association continues the same tournament on its own account, with live birds only. The League management puts up \$50 for fourth and fifth. Open to all. For average money, six guns, \$13, \$11, \$8, \$7, \$6, \$5. All regular events to be shot through both days. Targets 2 cents. Manufacturers' agents and the like are barred from entering the sweep and from share of special prizes. Members of League only are eligible to compete for special prizes."

The Enterprise Gun Club, of McKeesport, Pa., will hold its second annual tournament on April 22 and 23, open to all. Shooting commences at 10 o'clock each day. Interstate Association rules, known traps and angles, 10-gauge guns barred. Targets, 2 cents. The handicap is as follows: All high guns will be required in each subsequent event to duplicate the score made in the preceding event, and upon failure to do so will not be considered winners in such event.

The terse letter of Mr. E. S. Rice, re the Grand American Handicap, disposes definitely of the false and unpleasant rumors concerning himself and others, to which he refers. Those rumors are largely newspaper gossip, if one may judge from the excerpts in "Western Traps," by Mr. Hough. While there is nothing authentic in such rumors, many people accept them as being authentic if they remain uncontradicted. Mr. Rice's letter effectually disposes of them, hence they have no further importance.

On Tuesday, the first day of the Reading tournament, one squad of five men made an extraordinary record in a 20-target event as follows: Banks 20, Glover 20, Brewer 20, Money 19, Fulford 19. Close up was another squad, namely, Elliott, Heikes, Trimble, Fanning and Young, with 97 out of 100. Elliott broke 99 out of 100, Banks and Gilbert 98 each, and Heikes 97; truly top-notch work.

Other shoots forthcoming next week and the week after are the special shoot of the Hudson River Trap-Shooters' League, Newburgh, N. Y., on April 14 and 15; the tournament of the Massachusetts State Sportsmen's Association, Worcester, Mass., April 16; tournament at Du Pont Shooting Park, St. Louis, April 18 to 20; and tournament of the Lincoln Gun Club, Lincoln, Neb., April 19 to 21.

Mr. L. Nesbitt, erstwhile champion of Pennsylvania, spent a large part of the winter in Mississippi, where he enjoyed the sunshine between rainy spells, and had good sport with the quail. After dallying with the tournament at Hot Springs he returned to Wilkes Barre, and took part in the live-bird events of the last day, killing 14 out of 15 in the great open event.

In a return match between E. Johnson, of Atlantic City, and J. Frank Kleinz, of Philadelphia, at 100 live birds, \$200 a side, 28yds., at Gloucester, N. J., on March 29, Johnson was victor by a score of 97 to 85. In their previous match Kleinz won by a score of 82 to 80. The third match is fixed for April 8, the fourth at Gloucester, N. J., April 19.

Mr. F. M. Faurote gave up his purpose to be present at the Baltimore tournament, business cares requiring his attention at his home in Dallas, Tex. He left Reading on the last day of the recent tournament held there. Mr. Faurote made a host of friends in the North, besides demonstrating that he is of the stuff which makes crackerjacks.

Mr. John Wright announces that the Brooklyn Gun Club will give an all-day shoot on April 29, at which prizes will be given well worthy of earnest competition. The shoot will be under Mr. Wright's management. The regular weekly club shoot, on Saturday of this week, also has prizes to those who can shoot well enough to be winners.

There will be a holiday shoot, April 19, on the grounds of the Brockton Gun Club, Brockton, Mass. It will be the first of a series for merchandise prizes given by Mr. B. Leroy Woodard, Campello, Mass. After April 19 there will be shoots for prizes on every Saturday, to which all are invited.

Mr. L. Harrison, of Minneapolis, who has been a welcome guest at the many shooting clubs around New York for several weeks past, returned to his home this week. He was one of the contestants in the Grand American Handicap, finishing with 23 out of 25. At targets also he is very skillful.

Out of several photographs which we have of the winners at the Reading tournament, only one, that of Col. A. G. Courtney, was sufficiently good for reproduction. The Colonel is in that defiant attitude which becomes a man who has come, who has saw, and who have conquered.

Owing to the severe illness of Mrs. Heikes, Mr. Rolla O. Heikes returned to his home at Dayton, O., before the Reading tournament was ended.

THURSDAY, THIRD DAY.

Of the seven State events of Thursday, Nos. 1, 2, 3 and 6 were at 15 targets, entrance \$1.50, \$5 added money. Nos. 5 and 7 were at 20 targets, \$2 entrance, \$10 added money. No. 4 was the Reading trophy, and the following conditions governed in the competition for it:

"For five-men team championship of Pennsylvania; prize silver trophy, valued at \$200, donated by the Reading Shooting Association. To be contested for annually under the following conditions: Teams shall consist of five men, bona fide members of any club or association in the State Association. An entrance fee of \$10 shall be charged each club, one-half of which shall be in payment of targets, the balance, 50 per cent. to the donors or the holders of the trophy, the balance, 30 and 20 per cent., to the next teams in order; 25 targets per man, 125 per team, magatrap, 10 and 12-gauge guns at 16yds. rise. A bond in the sum of \$200 shall be given by the winners to the club, under whose auspices this Association shoot is given for its return to the club under whose auspices the next Association shoot shall be given; provided, however, there be no Association shoot given it shall revert to the Reading Shooting Association, of Reading, Pa. No one man to shoot on more than one team."

There were eight open events, seven of which were at 20 targets, \$2.50 entrance, \$10 added money. The eighth was the Gold Dust Powder event, 25 targets, \$2.50 entrance, \$10 added, the money divided as in the other events, and the first ten high guns to receive 1lb. each of Gold Dust powder.

The weather on Thursday was raw, and though somewhat cloudy yet there was a good light. The wind blew moderately stiffly and steadily from the shooters toward the traps, though a little diagonally, about from the No. 1 score to the trap. The shooters were a little slow in joining in the shooting in the morning, and it was not until about noon that they were out in force.

Four extra State events were shot on this day.

Young	475	405	.852	Money	515	391	.759
Trimble	515	438	.850	Hallowell	475	390	.758
Fulford	515	437	.848				

FRIDAY, FOURTH DAY.

This day was set apart for live bird contests, and several shooters who had been shooting at live birds in private events apart from the tournament were present and joined in it.

The weather was of March, though the day was of April. A stiff raw wind blew steadily and quite stiffly, favoring the men who shot in the open events at the traps in an improvised ground in the open field, since it blew toward them from the traps, making thus many incomers. Still there was much annoyance from the residuum of burnt powder blowing back, and at times finding lodgment in the eyes of the shooters.

At the set of traps where the State events were contested the wind blew from the shooters to the traps, slightly from the left of the shooter, as he stood facing the traps, therefore there were many swift drivers.

The birds were a mixed lot, poor, good and with now and then a strong, swift one, which tested the skill of the shooter to the utmost.

There were two State events, the first being the Williamsport diamond badge event, with qualities and conditions as follows:

"For the individual championship of Pennsylvania at live birds. Prize, beautiful diamond badge, valued at \$250. Presented by the citizens of Williamsport. To be contested for annually under the following conditions: Each contestant shall be a bona fide mem-

COL. A. G. COURTNEY.
Winner of E. C. Cup, Reading Tournament.

ber of a club or association, members of the Pennsylvania State Sportsmen's Association, or an individual member of same. First prize the diamond badge to the person making the highest score, the next three highest scores to receive the 50, 30 and 20 per cent. respectively. The winner of the badge this year to receive 40 per cent. of the entrance money next year, the balance to be divided as above. Each contestant shall shoot at 15 live birds, under American Shooting Association rules, with the exception of 1/4oz. shot allowed 12-bore guns. A bond in the sum of \$250 shall be given by the winner of the trophy to the club under whose auspices the Association shoot is given for its return to the club under whose auspices the next Association shoot shall be given; provided, however, there be no Association shoot given, it shall revert to the Williamsport Rifle and Gun Club, of Williamsport, Pa."

The contestants stood at 28yds. This event was won by Cooper, after shooting off two ties with Jim Jones.

The second State event, a team contest, was the L. C. Smith trophy event, and the conditions appertaining to it were as follows:

OPEN EVENTS.

No. 1, 7 birds, \$5, 30yds.	
Gilbert	2222222-7
Grimm	1220222-6
Nesbit	2222212-6

Five-dollar miss-and-out:	
Capt Money	1120
Martin	0
Gilbert	222222-6
Budd	221220
Breslode	0
Fulford	22222-6
Grimm	22222-6
Anthony	111210

Open event No. 4 was declared off on account of darkness coming on, and the above miss-and-out substituted in its place.

DEAD OUT OF BOUNDS.

Mr. W. Fred Quimby, the traveling agent of the American E. C. and Schultze Powder Co., was present at Reading last week. The inimitable Fred seemed to think that winning a Grand Handicap is a small matter if one only starts in and concludes aright. Mr. J. A. H. Dressel, of the U. M. C. Co., was a visitor at Reading during a part of the tournament last week. Mr. T. H. Keller arrived in time to join in the pigeon contests of the last day, the Boston Exposition having delayed him, it having engaged his attention entirely during the last few weeks. He reports great success, and is enthusiastic over the performances of the Peters ammunition, which took first honors in the rifle competitions at the aforesaid Exposition. For gall which knew no attenuation, the skirmishers at the Reading tournament on the last day were unequalled. A couple stationed themselves about 20yds. to the right of the shooters at the score in the open events, and proceeded to load a couple of pieces of rickety ironware with muzzles toward the shooters, their deportment being of the calm but assured kind which comes only from enjoying what is their own entirely, or some one's else entirely. The firm tones of Mr. Shaner insistently repeating the order to move out was the only obstruction to their blithesome purpose. The fences were well guarded by skirmishers, who rarely let a pigeon pass their line. The death of the pigeon seemed to be their only care.

Trap Around Reading.

BIG TEAM LIVE-BIRD SHOOT.

READING, Pa., March 28.—A live-bird match of more than ordinary interest attracted a large number of local and out-of-town sportsmen, among them being a number who were here for the opening of the State tournament at the Spring Valley Shooting Grounds. The match was between Coldren and Harrison, two local wing shots, and Eckert and Welsh, of the Riverton Gun Club. Each man shot at 100 live birds. The match was for \$200 a side. Eckert, Coldren and Harrison stood at 28yds., while Welsh stood at the 30yds. line. The best run was made by Coldren, of 27 birds straight, while Welsh had a straight run of 24. The second barrel shooting of Harrison and Eckert was fine. Betting was very brisk at the beginning, but after the third 25 the Coldren-Harrison money could find no takers. Mr. Charles W. Bechtel officiated as referee and gave entire satisfaction. In the first fifty birds Eckert and Welsh led by 2 birds, but in the third quarter they seemed to weaken, and at the 75th bird their opponents led by 2 birds, and thus kept it until at the finish of the match. Coldren and Harrison finished 8 birds in the lead. The birds were a strong lot of flyers, and 16 dropped dead out of bounds. The dead birds were distributed among the hospitals of the city. The score in full follows:

Coldren, 28	10120022222222200222012222012222222220201211211
Harrison, 28	22222012111222022122222222221221222222202010120-87
Eckert, 28	2002020221022220102222222002202222221222222222

Fanning	17	14	17	18	19						

The Keystone Gun Club, of Lebanon, and the Shuler Shooting Association, of Pottstown, are unable to select a date and place for the third and final match of a series of intercity team matches at live birds, and it has been declared off. The Keystone Club won the series, being victorious in the two previous matches that had been shot.

ARTHUR A. FINK.

Glenwood Gun Club.

NEWBURGH, N. Y., March 31.—Inclosed find scores made on our grounds to-day, twelve members taking part and 145 bluebirds being thrown. Our magautrap worked finely. The special league tournament of the Hudson River Trap-Shooters' League will be held on our grounds April 14-15. The entrance is small, being \$1; targets extra. The boys can shoot extra events for anything they like:

Stanbrough	01011111110111-12
Mills	1111111101001-12
Dickson	11111111010101-12
Carr	10110111010101-11
Stewart	10110011110101-11
Hoppenstedt	01010011101011-10
Lewis	011110011010110-9
Bartlett	11001011010110-9
Henderson	01000111101011-9
Wood	010101110100101-8
Holmes	000110100101010-7
Goodrich	100001010010101-7
Wm. M. Stanbrough, Sec'y.	

Mr. C. C. Beveridge, of the Brooklyn Gun Club, was in attendance at the first practice shoot of the Centredale Gun Club on March 26, in his peregrinations in New England recently. A sharp east wind blowing at right angles across the traps knocked hiatuses into the scores. Mr. Beveridge's 21 out of 25 proved to be the high score of the meeting. It may be incidentally mentioned that he won first average a few days prior, at the Boston Gun Club's meeting, by scoring 88 per cent. of 195 shots. He returns to New York this week.

WESTERN TRAPS.

SMOKE OF THE HANDICAP.

CHICAGO, Ill., March 31.—The beautiful weather with which Chicago has been favored this week has caused a good many devotees of the trap to think about a day or two in the field after snipe, instead of the customary afternoon at traps. The wave of trap-shooting enthusiasm which reached its height at the Grand American Handicap last week has now settled back, and there is a season of reaction for the time, which will probably be felt until the arrangements for the season club contests have been completed. In Chicago shooting matters were hardly satisfactory during the past year, but in a city the size of this it is difficult to use any term which shall be universal in its application. Some clubs did a great deal of shooting, and some did very little. Some clubs enter upon this season strong and growing, while others are weak and lax in interest. The fate of the Cook County League will not be determined until next Saturday evening. I understand that not even yet are all the merchandise prizes in the weird classification system of that body awarded. Should the organization conclude to go on with its work it might be well to take the advice of many shooters, to simplify its classifications and cut free from the ancient plunder idea. There will be proposed next Saturday evening a different course for the Cook County League this season. An attempt will be made to substitute for the Chicago club contests a series of intercity shoots, embracing a half dozen or more good shooting towns adjacent to Chicago.

I have seen a number of shooters who have returned from the Grand American Handicap, and most of them are very philosophical over their failure to land the cup. I have heard personally no criticism upon the management of the Grand American Handicap, nor have I heard personally any complaint regarding the treatment of Western shooters at that event. It is not the custom of the thoroughbred Western man to complain after he has been fairly beaten in any contest. As for the talk of a lack of personal courtesy accorded Western shooters, such as came up last year, I trust we shall hear no more of it this season, for nothing could be conceived which would show a more execrable taste. It is true that the Grand American Handicap is an open event for all shooters, and open also to criticism; yet while it has been held in the East the Western men were in a sense guests of the East, and to complain of any personal reception under such circumstances is precisely the same thing as accepting an invitation to a man's table and openly complaining afterward of the quality of the food offered. I trust no Eastern man will consider any genuine Western man as guilty of any such breach of form. Such action does not represent the spirit of the West, nor of Chicago, nor of the men who represented the West and Chicago at this shoot.

I make the above remark somewhat in view of a discussion which has taken place to-day among many Chicago shooters in regard to statements published in the local columns of a Chicago daily, the Times-Herald. "Thing that is writ is writ, and forth it goeth, though him repent, and be he ne'er so loath." Such a statement might find its way into the hands of men who would not understand it so fully as do the Chicago people. I give the story in full as printed:

"Dissatisfaction with the handicapping, conditions and management of the recent Grand American Handicap in the East has caused a secession of Western trap-shooters. Plans are being formulated for the organization of the Western Trap-Shooters' League of America.

"The movement for a separate and distinct organization in the West has been fostered for several months. It broke into prominence at the Grand American Handicap held at Long Branch, N. J., last week. The Western shooters received poor treatment and charge that the allowances were unfair. It was managed by a clique of Eastern powder and gun companies. The programme was withheld until too late to object to the conditions of money division.

"The Western shooters assert they will never go East to compete again. One man said yesterday he would not go again if his entire expenses were guaranteed. The Westerners are busy planning the new league, and expect to form a permanent organization within a few weeks.

"Elliott S. Rice, one of the local enthusiasts and a foremost dissenter from Eastern methods, has offered a tract of 220 acres, just south of Blue Island, on the Rock Island Road, for the use of the new association. Part of it is now used for powder magazines and storage purposes. Several buildings suitable for gunrooms, a club house and other fixtures are at present unoccupied, and could be utilized by the shooters. The plant is equipped with electric light and steam plants. It is thought \$5,000 can put the grounds in excellent condition for the sport.

"It is the intention of the promoters to hold an annual handicap tournament, similar to the Grand American, except as to conditions, manner of handicapping and management. Instead of but two high gun moneys there will be four, 40, 30, 20 and 10 per cent. That will insure the twenty-fifth, twenty-fourth, twenty-third and twenty-second men a part of the money, whereas only the two higher marks broke in at Long Branch."

The organization of the Western Trap-Shooters' League is something not of itself to be condemned out of hand. If it were well handled, and if it met a popular demand in the West, it might grow into a strong and useful body. It has this to be said for it, that it is a long way from here to Elkwood, and that a great many shooters find it difficult to go for so long and expensive a trip. This is a big country, and in view of the great growth in trap-shooting matters it may be possible that two great handicap contests could be held each year. The history of all these things is practically the same, and it resembles the history of the Roman Empire in a great many ways—a gradual growth and extension, and then a final dropping off of the most distant members, one by one. The Grand American Handicap cannot go on year by year growing continuously. It may be that it reached its high-water mark this year. Even if it never were shot at all again, it has made history and it has served its purpose. This much may be said without any prophecy whatever of what may be done next year. A great deal of the talk about holding a handicap in Chicago has been a matter of local pride. We all like to talk about our towns, and we sometimes "let on" a little bit. The American spirit is very well understood in these matters, and it certainly need not be carried to the extent of creating any actual sectional feeling. Should the Grand American Handicap come to Chicago next year I doubt if it would be as successful as it was this year. We are not really prepared to handle the shoot here without undergoing great expense in the way of preparing proper grounds and houses. Most Chicago shooters are willing to consider the Grand American Handicap as a national event, and if it be national the question of locality should not be sectional. We would of course like to see the event come here, and Chicago has never seen anything yet so big that she could not handle it, but the question is whether it is worth Chicago's while. It is very doubtful whether the representation from the East would be relatively as strong as it has been from the West, since heretofore the Handicap has been held near to heavy shooting centers. It is easier to travel a hundred miles than a thousand to attend a shoot, no matter how big it is.

In all these matters, pro and con, there may be a reason for being for a Western league. That remains to be seen. Such a body, if broad and catholic, might be a good thing; or again it might prove to be only one more of the numerous and complex "leagues" which are not leagues at all, but really "splits." I think this covers the question very nicely. If it is organized as a split it could not succeed. If organized as a league and for natural purposes, it should succeed. This is a big country, but it is all one country. We used to hear of the North and the South, but we do not now. Let us not try to hear of the East and the West in any way except in the way of union.

As to the comment in the above newspaper clipping, it is printed only for what it is worth, and its absurdity is obvious. It represents in no way whatever the sentiment of the Chicago shooters or of Western shooters. There will be a few kickers at every shoot, and I presume there were some at this shoot; but kickers in the above form do not represent the gentlemen of this city or this part of the country. The shooter who cannot take a licking had better not go out to shoot. The little girl who wants to take her doll and go home because she doesn't get all the jam is usually not severely missed, and her jam is eaten by some one else very cheerfully. The above representations do not deserve any apology, but to cut it short, I should like to say for the benefit of those readers of FOREST AND STREAM who live in the East that there has been no such broad expression of "dissatisfaction with handicapping, conditions and management of Grand American Handicap." There has been no charge by Chicago shooters to the effect that it "was managed by a clique of Eastern powder and gun companies." We in Chicago as a body do not believe that any favoritism was intended or was possible. The admirable report of FOREST AND STREAM alone would show it for what it was, a great affair, admirably handled, and with men of the highest executive ability in every responsible position. This is what we want the gentlemen of the East to believe is the sentiment of the gentlemen of the West. The question of an organization of a separate trap-shooting body is a separate and distinct affair. If it succeeds it will be because it has been

managed in an honorable and manly way. I do not think it will ever be begun for any petty or ignoble reasons, and if so its success would be a qualified one, commensurate only with the homely adage that "you can fool some of the people all the time, and all of the people some of the time, but you can't fool all the people all the time." The Western shooter knows what he wants. I do not need to protest or apologize for him. He is a pretty fair-minded and hard-shooting citizen, as I am sure the Eastern men will freely admit. Statements like those of the Chicago daily misrepresent the West, and they misrepresent Chicago. They should be signed only by the few individuals who would care to make them.

I have spoken with numbers of the Chicago boys this week, and it is the exception to find one who does not voluntarily find words of praise and congratulations for the winner, Life Fulford, of Utica. Come out and see us, Life. I don't know, but maybe you could break into our safe now, and if you can we will not kick.

THE TROPHIES.

Of all the different championship talks that have been made, I presume we shall eventually see Elliott and Parmelee come to Chicago and try to take away from Fred Gilbert respectively the Kansas City Star cup and the Du Pont trophy. Jimmie is plenty patient, and he may catch up to Fred some day. Parmelee is looked on with a great deal of favor here just now. It is generally understood here that the talk about Brewer's shooting Gilbert fell through at the close of Brewer's defeat by Parmelee, when Brewer's Philadelphia backers declined to go on further at present. So long as Jack Brewer talks about shooting for thousands of dollars on the side, the folks out here will be principally amused. Still, fortune has a specially well oiled wheel for trap-shooters, and Jack may again come out on top and in a position to talk business and to shoot a race good enough for the youngsters who are coming up.

Speaking of youngsters and possibilities, there seems to be no especial reason for overlooking Mr. Loomis, of Omaha, who, as the winner of the Grand American Handicap very probably remembers, was one of those who also ran, and ran hard and close up.

CHICAGO LIVE-BIRD CHALLENGE TROPHY.

On next Wednesday we will endeavor to shake things up a little in this village with the inaugural shoot for the Chicago live-bird handicap trophy. The following entries have already been received for this event, and several more are expected to qualify: J. H. Amberg, M. Goldsmith, O. von Lengerke, Silas Palmer, W. T. Johnson, J. S. Wilcox, L. C. Willard, G. A. Airey, W. L. Shepard, Henry Levi, C. Antoine, J. B. Barto, W. H. Palmer, H. B. Foss, Ed C. Rice, W. H. Buker, T. P. Hicks, W. P. Mussey.

TEXAS CHAMPIONESS.

Texas has a lady champion in Miss Wana Lotta Flatau, of Dallas, who at the tournament of the North Texas Gun Club, March 25, defeated Mrs. John Tiller in the contest for the ladies' State championship previously held by Miss Flatau. This tournament of the North Texas Gun Club was the eighth annual, and was well attended, the entry running to 56 on the second day.

IN OKLAHOMA.

The Gun Club of El Reno, O. T., is getting ready for a good tournament April 12-13. This ought to be a warm event, for shooters down in that country have a nerve which a cyclone here or there does not jar.

CENTRAL OF DULUTH.

Mr. E. C. Maxfield, secretary of the Central Gun Club, of Duluth, Minn., sends me the following announcement under date of March 27:

"At the annual meeting of the Central Gun Club, of this city, Mr. J. W. Nelson was elected President; A. B. Thomas, Vice-President; Warren Mendenhall, Field Captain; A. W. Loud, Lieutenant; E. C. Maxfield, Secretary and Treasurer.

"The regular annual tournament of the club will be held during July or August.

"The prospect for a successful shooting season at the head of the Lakes is very bright, the Superior and Duluth clubs having arranged for a series of interurban team shoots for a medal which will be put up by the clubs."

THIS SOUNDS BETTER.

CHICAGO, Ill., April 2.—Earlier in the week I had occasion to comment upon the statements made in the Times-Herald, of this city, in regard to an alleged disaffection of the Western shooters. To-day I should like to offer something from the columns of another Chicago daily, the Chronicle, which sounds better. It is not quite so obviously inspired, but is quite obviously more representative of the feelings of the Chicago shooters. I am not responsible for all the inferences and deductions made by the Chronicle, but I am free to admit and to reassert that this talk about dissatisfaction of Western men with the treatment they received at the Grand American Handicap is in no way truly representative of the feeling of the sportsmen of the West, nor of the sportsmen of Chicago. There is a very grave mistake out, and it is only fair to voice the wish of the majority that this mistake and that these misrepresentations should be checked at once, in order that the Western men may be placed in proper light in the eyes of their Eastern brethren, who entertained them so royally. I have heard more expressions of regret and chagrin over this than over anything which has come up for a long time.

As to the organization of a Western league, there is no reason to change the belief earlier expressed. If rightly planned and rightly conducted, the league should be a good thing. It is largely a matter of cash. If sufficient money be put into the tournament of such a league it will be a success, and the Western shooters will cheerfully come to it and shoot for the money offered. A good many of them will also go to the Grand American Handicap, wherever it is held, and will also cheerfully shoot for the money offered there. The men of the West were out of leading strings long ago, and they are apt to make up their minds about these matters and to go where they please, and where they think it will pay them to go.

As to the trade interests involved, that is a question pertinent only to the firms interested and to the managers of the Interstate Association. No word has been received here, so far as known, putting the heads of any powder company, any gun firm, or any sporting goods house on record against the methods of the Interstate Association. Trade interests have nothing to do with the abstract principles of sportsmanship, the greatest of which is to be fair. It is not fair to charge the Western sportsmen with this discourtesy of complaint against their Eastern brothers, which complaint they have not made and do not intend to make. I append the clipping from the Chronicle to which reference has been made:

"Such men as C. B. Dicks, Ed Bingham, John Glover, L. H. Goodrich, T. P. Hicks, Silas Palmer, Tom Marshall, and a dozen others prominent among gun club men, say that no better treatment could have been given than that of the Eastern sportsmen to their Western visitors. But one complaint was made about the handicaps—Dr. Shaw thought his too strong, whereupon the Easterners graciously reduced it from 29 to 28yds. But three men were on the 25yd. line out of the 207 entries, and two of these were from the West. The third man was W. S. Cannon, Newark, N. J., a one-armed marksman, who pulled the trigger of his gun with his left finger, the gun against his left shoulder.

"The contestants were the cracks of the country. Nine men tied with straight scores. Of the nine but one man, and he a Westerner, shot the grade of powder that the Chicago owner of the projected trap-shooting grounds is interested in. Recent trap-shooting publications are filled with black-line heads telling of the kind of cartridges and powder that were prominent in the Great American Handicap, and to the feeling these have engendered is attributed the report of ill-treatment, dissatisfaction with the handicaps and secession. The great bulk of the Western men are not only satisfied with their treatment at Long Branch, but they are pleased at the conditions that obtained, and are ready to go in force when the big event is again contested."

ON THE COAST.

Word comes this week from Harvey McMurchy, who is at present doing missionary work on his annual trip to the Pacific coast, and who shot with the Lincoln Gun Club, Frisco, at Alameda Point, at their opening shoot. Mr. McMurchy has often been reported as interested in the possibilities of the Golden State in the fruit-growing line, but it is to be hoped that he is not yet ready to buy a ranch and quit the gun business, no matter how attractive may seem the succulent prune or the soulful claret tree.

COOK COUNTY LEAGUE DISBANDS.

A special meeting of the Cook County League was held to-night at the Sherman House, this taking the place of the passed meeting of that body which should have been held last December, and being supplementary to the directors' meeting held earlier in the week and elsewhere reported. The recommendation of the directors that the League be disbanded was adopted, and by a formal vote the resolution of dissolution was carried. Thus

Fifty consecutive shots in 25 minutes by E. E. Partridge in the military revolver championship match at the N. E. S. A. tournament, with a Colts army revolver and .38cal. U. M. C. full-charge cartridges.

Six shots in one minute, by E. E. Partridge, in the military revolver re-entry match at the N. E. S. A. tournament, with a Colts .38cal. army revolver and U. M. C. full-charge cartridges. Distance 20yds.

Fifty consecutive shots in 50 minutes by C. S. Axtell in the pistol championship match at the N. E. S. A. tournament, with a Smith & Wesson pistol and .22cal. cartridges.

Six shots in one minute at 20yds., by F. B. Crowninshield, in the military revolver match, at the N. E. S. A. tournament, with a .38cal. Colts army revolver and Peters full-charge cartridges.

Rockies, with twenty-three mountains in vicinity higher than Mt. Washington, N. H. In scenery it is the Switzerland, and in climate the Italy of America. Location is suitable for temporary residence in summer or winter, or for permanent residence during the entire year, and is one of the most healthful on the American Continent, nervous diseases, dyspepsia, throat and lung troubles being greatly relieved, if not entirely cured, by stay in the climate. Schools, stores, and exceptional religious privileges are already being provided. Among the 200 lot holders and members of the Association are ministers, returned missionaries, physicians, business men, and school teachers.

Location is only twenty-two hours from New York, via Southern Railway, without change of cars. Full details and explanation of this unique plan of colonization, and for obtaining health and rest in congenial surroundings, may be obtained by addressing A. S. Thweatt, Eastern Passenger Agent Southern Railway, 271 Broadway, New York, N. Y.—*Adv.*

Decoration Day Tour to Gettysburg, Luray and Washington.

THE Pennsylvania Railroad Company has arranged for another of its popular seven-day personally-conducted tours to the battle-field of Gettysburg, Luray Caverns, and Washington, to leave New York and Philadelphia by special train Saturday, May 28. Rate, \$27 from New York; \$24 from Philadelphia, covers all necessary expenses. Proportionate rates from other points. For itineraries and full information apply to ticket agents; Tourist Agent, 1196 Broadway, New York; 789 Broad street, Newark, N. J.; or Geo. W. Boyd, Assistant General Passenger Agent, Philadelphia.—*Adv.*

SINCE the last war John Finzer & Bros., of Louisville, Ky., have been manufacturing chewing tobacco, and the result of their years of experience and knowledge is shown by the fact that their brand of chewing tobacco "Boot Jack" is celebrated from one end of the country to the other as the leading brand, and is recognized by experts as the best chewing tobacco that can possibly be produced at any price. Ask your tobacconist for a sample and you will always chew it.—*Adv.*

Outfitters for the Field

FIND the Game Laws in Brief a highly valuable advertising medium for reaching practical sportsmen. Most purchasers of the Brief are men who are going shooting or fishing. The Forest and Stream Publishing Co. will supply to advertisers information about the new Brief issue soon to go to press. Write to us.

In Southern Mountains.

CHRISTIAN COMMUNITY IN THE APPALACHIAN MOUNTAINS, NEAR ASHEVILLE, N. C.

On the line of the Southern Railway, in the heart of the Appalachian Mountains, twelve miles east of Asheville, N. C., and the 100,000 acre estate and \$3,000,000 palace of George Vanderbilt, a number of prominent ministers of various denominations and Christian business men are establishing a mountain health resort and Christian community. Among the incorporators and managers are: Rev. Floyd W. Tompkins, Jr., Rector of Grace Episcopal Church, Providence, R. I.; William H. Wanamaker, of Wanamaker & Brown, Philadelphia, and brother of ex-Postmaster-General John Wanamaker; Rev. David Allen Reed, President of the School for Christian Workers, Springfield, Mass.; Rev. David Gregg, D.D., Pastor Lafayette Avenue Presbyterian Church, Brooklyn; Rev. H. H. Kelsey, Pastor Fourth Congregational Church, Hartford, Conn.; Rev. A. C. Dixon, of Hanson Place Baptist Church, Brooklyn; and Rev. John C. Collins, Secretary of the International Christian Workers' Association, New Haven, Conn. These and others have obtained a charter from the North Carolina Legislature, with special privileges, and are establishing a community, general plan of which is similar to that of Ocean Grove, N. J., but under the direction of ministers and Christian people of several denominations. Sale of liquor is forever prohibited by legislative enactment. There is no personal gain to incorporators. All profits from sale of land and other sources belong to the entire community, and are used for schools, streets, and ordinary expenses of colony. The grounds of the Association contain over 4,300 acres (about seven square miles), with altitude of settlement 2,700ft. above sea level. Highest land this side of the

Fifty consecutive shots in 25 minutes at 20yds. by Dr. R. H. Sayre in the any revolver championship match at the N. E. S. A. tournament, with a Smith & Wesson .44cal. Russian model revolver.

FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

TERMS, \$4 A YEAR. 10 CTS. A COPY. }
SIX MONTHS, \$2. }

NEW YORK, SATURDAY, APRIL 16, 1898.

VOL. L.—No. 16.
No. 346 BROADWAY, NEW YORK.

The FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. The editors invite communications on the subjects to which its pages are devoted. Anonymous communications will not be regarded. While it is intended to give wide latitude in discussion of current topics, the editors are not responsible for the views of correspondents.

Subscriptions may begin at any time. Terms: For single copies, \$4 per year, \$2 for six months. For club rates and full particulars respecting subscriptions, see prospectus on page iv.

Migratory birds in spring should be protected in every State, no matter where they are flying to, for they are the children of our common country, and are gladdening every part of it in their migrations. No rule is so good as the rule that no gun is to be fired at birds or animals in spring or summer. Every reason of health to the eater, of abundance of supply of the article eaten, of justice to the animal when breeding or preparing to breed, plead for the fullest and most comprehensive and uniform laws in these matters.

Charles Hallock, 1874.

PRACTICAL ANGLING PAPERS.

THE series of chapters on fishing by Fred Mather are designed for the practical instruction of beginners. Their scope will include trout and bass, perch and pickerel and other fishes in the angler's list.

We have in hand for publication, to begin next week, a series of papers on Dry Fly-Fishing, by Mr. Geo. A. D. Dewar, author of the "Book of the Dry Fly." This is the acme of the art of fly-fishing, as practiced in Great Britain and beginning to attract attention in this country. We anticipate for dry fly-fishing a vogue in certain parts of America with followers not less devoted and enthusiastic than those of the English stream where the art had its rise.

MAINE GUIDE INTERESTS.

IN another column is printed a communication from Commissioner L. T. Carleton, of Maine, commenting upon the suggestions contained in our remarks of last week respecting the guide law and guide interests.

Mr. Carleton appears to have read into what was written a spirit which no unprejudiced construction could fairly find there of opposition to the guide law. We had not the remotest purpose of seeking to bring the statute system into disrepute, nor need it be said that we were not writing in defense or encouragement of lawless guides or lawless sportsmen. The purport of the article briefly summed up was this: That among the guides licensed by the Commissioners last year were numerous incompetents; that the possession of the official certificate or badge was therefore no evidence of the possession of proper equipment for the occupation of guiding; that by thus artificially putting incapable guides on a level before the world with those who were skilled an injustice was done to the experts of the craft; that as the operation of the law had failed to correct such an abuse, the guides themselves by voluntary association and discrimination could separate the real woodsmen from the pretenders, and protect their own interests. The plan proposed was in fact wholly in line with the guides law system, and supplementary of it, to accomplish one of the ostensible purposes which the law itself may have contemplated, but certainly has not secured.

Commissioner Carleton appears fully to recognize the existence of such conditions as we named, and he acknowledges them in his letter when he explains in mitigation of them that the territory was large, the Commissioners were unacquainted with many of the applicants for licenses, and that in many instances the Commission was imposed upon and granted licenses to those who should not have had them. He expresses a conviction that the system provided by the law contains within itself a practicable means of more stringently discriminating between fit and unfit applicants for license; and that by a more rigid examination the licenses may be confined to those whose skill and acquirements merit them. This is, in short, to say that the Commission are in the future to do precisely what we said should

be done. If the ends can be accomplished by the operation of the law the voluntary associations would not be needed; but it is probable that the work, if undertaken by voluntary associations, would be accomplished much more speedily and thoroughly than could be hoped for under the guide license law alone.

The strongest criticism on the guide system, based upon this lack of discrimination of merit in granting applications for licenses, is found among those guides who are most zealous for game protection. In contending for a higher standard of merit among the licensed guides of Maine we were speaking for the class of Maine guides who represent not only the highest skill in woodcraft, but the most advanced game protective sentiment of the State. The guides as a class are progressive in their appreciation of the merits of strict compliance with the game laws. They respect the statutes themselves, and they are learning to compel a corresponding respect for the law on the part of the sportsmen they take into the woods. The average intelligent guide understands on which side his bread is buttered, to use the homely phrase; and he is a game law observer out of principle. Great as are his opportunities individually, they would be larger and more generous were the guides of the several sections united in voluntary associations, the purpose of which should be co-operation for the enforcement of the law and for elevating and maintaining "the recognized standard of character and ability which should belong to a Maine guide." The Game and Fish Commissioners would advance the game and fish interests if they would promote and encourage just such voluntary guide associations as we suggested last week.

READY, AIM, FIRE.

THE vast difference between firearm conditions in the 60s and to-day is hinted in the loading commands then and now. This was the order in war times: "Handle cartridge, tear cartridge, charge cartridge, draw rammer, ram cartridge, return rammer, prime, ready, aim, fire." To-day the command is: "Load, ready, aim, fire." It is just the difference between the perfected cartridge as in use now and the primitive paper cartridge, to "tear" which meant to bite off the end of it. We live in an age of such improvements and perfections of all the appliances of industry, social life and sports, and are so given to accepting improvements and simplifications as matters of course, that we hardly realize what an admirable triumph of art the modern rifle or the shotgun is. In lightness and strength, simplicity and ease of manipulation, safety and effectiveness, it is a mechanical produce worthy of the age which has simplified the locomotive and the sewing machine. Mr. Fred Mather's advice, that the angler should equip himself with a good rod, in which he may have lasting satisfaction and pride, applies with equal force to the choice of a gun. A handsome, symmetrical, high-grade shotgun is an object which grows in the appreciation of its possessor as the years pass and the successive seasons invest it with associations of days in the field.

BRUTE AND HUMAN.

A WELL-KNOWN New York woman was recently injured in a hunting excursion in the vicinity of Aiken, S. C. As related in the newspapers, the accident occurred in this wise: The huntswoman was on this occasion riding a horse which was considerably taller than the one to which she had been accustomed in previous hunts; the chase led across a covered bridge, through which on the smaller horse she had ridden without bending her head; and now, forgetting that she was on the larger horse, she rode erect, struck the bridge and fractured her skull. At this writing the result is still in doubt. The chase, it is related, was in pursuit of a tame deer which had been let out, like the carted stags used for the Queen's Buckhounds, to be followed by horse and hound.

Commenting upon the accident and the circumstances attending it, the Boston humane journal, "Our Dumb Animals," gives it as its deliberate opinion that the unfortunate woman "got no more than she deserved" for having participated in such a pursuit. This is interesting as an expression of that witch-burning ferocity which never hesitates to fit the punishment to its own measure of the enormity of the crime. It is another example of the smug complacency which contemplates with satisfac-

tion the direst human calamities as special providences upon the unrighteous. Opinions may differ as to the merits of chasing a freed tame deer; but in its darkest aspects the action cannot be painted so black as is the brutal utterance in a public print, that a woman lying at death's door "got no more than she deserved." That is fanaticism hardly to be looked for in America to-day, and in Boston at that. Its most charitable excuse may be found, perhaps, in the fact that people who are constantly brooding over the inhumanity of mankind to the lower animals come in time to a cranky condition of mind which is equivalent to mental irresponsibility. Unmitigated by such an explanation, this comment by President Angell, of the Humane Society, takes rank with the most bigoted and brutal treatment of woman to be found in the history of American journalism.

SNAP SHOTS.

THE Weekes bill to repeal Section 249 of the New York game law was signed by Governor Black on April 6. This makes good the legislative triumph of those who have been contending for game interests. Under the new order we may confidently look for more efficient product worthy of the age which has simplified a game protector; there is no other point on the continent so important as this vast market center; and it should be amply and adequately policed. We have frequently pointed out that the system of game traffic permitted by the law which has just been repealed involved injustice and wrong to many other States. It is no less true that in enforcing the law under the new conditions New York will insure not only its own benefit, but that of all other States concerned. The good effects of this year's work at Albany will be felt throughout the West. In the operation of the market laws regulating game we have an illustration of the interdependence of the States. If you strike one you strike all; all for one, and one for all. Of the many forces which were working for the repeal of Section 249, that of the New York League should not be overlooked. President Gavitt and his associates on the Law Committee were untiring in their efforts, and to them is due credit for influencing many members of the Legislature.

To slur and ridicule the possessor of information and ability as being "scientific" is the common recourse of ignorance and fraud. The newly installed Superintendent of the New York Aquarium, appointed to his place by a transparent and dishonest trick, gave his own measure in a talk to the reporters the other day in which he derided his predecessor as having been unduly "scientific." The fact is that an aspirant for the place now held by Col. Jones was formerly subject to a civil service examination, by which he must demonstrate his equipment of practical information about aquarium management fitting him to manage the institution. Dr. Bean was possessed of such qualifications. Under the new law no such test of fitness is required; and we have the spectacle of an important public possession, which requires for its successful administration peculiar qualifications, turned over to a spoils appointee who declares that the former superintendent was "too darned scientific," and sounds the depths of vulgarity in his characterization of certain of the Aquarium employees. The situation is not calculated to inspire civic pride in the breasts of the people of Greater New York.

The Massachusetts law of 1897 against wearing bird feathers as articles of dress was pronounced inoperative because held to apply only to birds killed in the Commonwealth. A new measure has been prepared this year which is so broad in application as to cover all bird feathers, whatever the source of supply. This, if it shall become a law, will give the feather dealers an opportunity to test their contention that the statute would be thrown out by the courts as sumptuary and unconstitutional. The New York bill for a similar purpose did not become a law.

Writing of a Connecticut country doctor, a correspondent relates that it was his custom to take his fishing rod with him, or in the autumn dog and gun, on the way to make professional calls; and many a patient was made happy by the gift of grouse or trout. A little thing, but in it is the key to a life.

The Sportsman Tourist.

Fruits of Uncle Gid's Christmas Tree.

"You want tu quit a-watchin' for 'em, if you want tu hev 'em come," said Uncle Gid Corbin, as for the twentieth time that Christmas morning Aunt Milly went to the window, wiped the steam from a pane with her apron, carefully adjusted her spectacles, and searched the two blue lines which marked the freshly beaten road to where they blended in one, on the crest of the furthest ridge.

"Wal, I do know but what you're right, father. The' hain't nothin' in sight as fur's I can see. There, positively, I will not look ag'in." She fortified herself with a final searching glance, and turning her back resolutely upon the shining outer world, waddled briskly across the kitchen, whose furniture celebrated every step of her progress with lively acclaim.

"Land sakes!" she sighed, as much with the effort of squatting before the oven door of the stove as from the suggested possibility. "What if they shouldn't come arter all."

With corrugated brow and set lips she made feints at the hot latch with her bare hand, then sheathing it in the corner of the ever useful apron she flung the door open, letting out a steaming fragrance of baked meat that Uncle Gid craned his neck to get a fuller sniff at, and such a crackling of seething fat that Gabriel, the hound, scrambled out backward from his warm berth in considerable alarm.

"They've got tu come," said Uncle Gid, leaning further forward and sidewise to catch a glimpse of the source of the savory odor. "You 'n' I can't eat all you've fixed up in a fortnit. By hokey! if they git a smell o' that coon a-roastin' they'll haf tu! I'm good min' tu op'n the aoutside door an' let some on't drift tow-wards 'em."

"Wal, it doos mos' seem 's 'ough the' wouldn't ha' been so much come so providential all for nothin'," said Aunt Milly, as she drew the dripping pan so far out to baste its contents that nearly the whole length of the raccoon, sweating fat at every pore and beginning to blush with a delicate bloom of brown, was displayed to her husband's admiring eyes. He heaved a sigh of satisfaction and began filling his pipe, feeling as great a desire to smoke as if he had partaken of a feast.

"What you goin' tu call it?" she asked, as she shoved back the pan and closed the door. "They might spleen ag'in coon."

"They can't a-lookin' at it an' a-smellin' on't, an' folks 'at spleens ag'in good game don't deserve no victuals," said he, adding, after some reflection, "but we might call it turkey."

"Good land! a four-legged turkey! Hain't you ridiculous, wi' your four-laigged faowls an' your four-year-old child'en a-nussin," Aunt Milly chuckled.

"Wal, you needn't laugh, mother, for I seen a tew-headed chicken onct, an' I d' know why a turkey couldn't jest as well hev' a extry pair o' laigs. But we can call it a pig if you'd any druther."

"Only it hain't got no skin on," she objected.

"Tain't nob'dy's bus'ness if we skin aour pig," he asserted; "I'd livser 'n tu singe 'em, as I seen Pete Frenchman his'n. Yes, sir, laid his coshaw, as he called, ontu a scaffil, an' lit some straw 'n under it, an' jest scorched the brussels off on't. You never see sech a lookin' thing—blackier 'n Tony's face. I sh'd think 'twas coshaw!"

"What's that, anyway?" Aunt Milly asked.

"Oh, I s'pose that is French for pig," Uncle Gid answered, and then to the hound, who came and nuzzled his hand for a caress: "Why, sartin, ol' dawg, the' wouldn't ha' been no coons nor no honey if it hedn't 'a' been for him. Course his Uncle Gid knows that, an' so doos his Aunt Milly," and Gabriel acknowledged the recognition of his service with rapid beats of his tail that swept the sand into little windrows on the clean scoured floor.

Aunt Milly's face lighted up suddenly with a happy thought that flashed upon her. "Le's we call the coon a coshaw!"

"By hokey, we will!" Uncle Gid declared, enthusiastically; "if they can't stomek it by that name, the' 's three pa'tridges for 'em, one apiece, if that boy raly has took tu solid victuals, an' you an' me 'll go it on coshaw. What is that 'ere noise?" he demanded, with a quick change of tone, as the mellow jangling of Boston bells became audible above the monotony of his voice, the shrill song of the kettle and the muffled sputtering of the raccoon in its hot prison.

"Jung-jang, jung-jang," sang the sixteen big and little hollow, bronze globes, each wide mouth smiling blandly as it rolled back and forth, as a sweet morsel, the iron pellet which was its tongue.

"Le' me look, mother; if you look it won't be them!" cried Uncle Gid, forestalling his wife's advance toward the window with such celerity that Gabriel became excited; for he seldom saw his master move so quickly, unless to take the rifle from its hooks. But now, to the hound's disappointment, he stooped to the window and carefully regarded the approaching brown horse, the bread-tray shaped sleigh, and its occupants, and then as they recognized him through the misty panes, and smiled and nodded greeting, proclaimed joyfully:

"Wal, by hokey! it is them—Nancy an' Nathan an' that 'ere baby. I say for 't he is a lunker er less they've got him turribly bundled up."

He donned his cap, and as he hurried to the door, put on his coat with the collar turned in, which Aunt Milly plucked at unsuccessfully while she bustled behind him in a fidget of nervous excitement, and Gabriel pressed so closely in the rear as to threaten the downfall of both in his struggle to be foremost. Then, just as the door opened, the jung-jang of the bells became slower, then broke in scattered drops of musical sound, then ceased before it, and there arose a less musical, but as joyous, and louder, clamor of two feminine voices

both asking questions at once, and never answering one, for that must come later; and there was also the clear, shrill treble of the child's voice beginning the relation of his wonderful journey, and asking unanswerable questions; and Gabriel welcomed the guests with sonorous trumpet blasts; while the two men, being unable to exchange an intelligible word, grinned dumbly at each other in amused helplessness. Then the boy was unloaded into the embraces of his grandmother, and Nathan, tall, strong and good-natured, diffusing a wholesome odor of the chips and shavings made in his craft of carpenter and joiner, lumbered out of the huge bread-tray and pulled Nancy out of the entanglement of the buffalo skins, and got her on her feet—a comely, buxom young matron, having something of her father's height, something of her mother's breadth, and a wisely, motherly face, aglow with health.

So at last Uncle Gid and his son-in-law were given an opportunity to shake hands with each other, after which they drove to the stable with their feet hanging outside the sleigh, and made the horse as comfortable as possible, in the company of the cow and the small flock of poultry to whose use the equine abode had long been devoted.

When they entered the house the uninterrupted flow of the women's conversation had subsided into two nearly distinct currents, and was almost intelligible to their husbands; yet as its subjects were mainly marriages, births and deaths, it did not interest the men so much that they did not find more entertainment in their own chat in the corner behind the stove. Nathan was not a hunter, but he listened attentively to Uncle Gid's stories of the chase, and said "gosh" with discriminating emphasis at the proper points. He sometimes went fishing, and now related experiences, in which Uncle Gid expressed no unbelief; also both smoked, so there were various bonds of sympathy between them.

The little boy, with a slice of bread and honey, sat on the floor in a state of bedaubed contentment, which the hound, lying far under the stove, did not fully share in, being made to impersonate the horse in a rehearsal of the late memorable sleighride, his tail serving as reins.

An eavesdropper might have gathered from the medley of voices, accompanied by the continuous shrill tenor of the tea kettle and the bass of the stove draught, something like this of the double dialogue:

Aunt Milly: "An' don't you believe, Nancy Sherman, it wa'n't scarcely six months arter Miss Hale was laid in her grave, not more 'n seven anyway, 'fore the Squire up an' married Susan Taylor."

Nancy: "You don't say!"

Aunt Sally: "Yes, sir. Some thought it was kinder craoudin' the mourners; but I s'pose he felt for the want of a companion."

Nancy: "Wal, wal! I see 't the Hale place was fixed up dreadful scrumptious as we come by, but I hedn't no idee!"

Aunt Milly: "Yes, indeed; an' they went over the lake tu her folks on their weddin' taower."

Nancy: "I want to know!"

Aunt Milly: "An' naouw, if they ain't got a baby."

Nancy: "Mother Corbin, for all this livin' world!"

The Boy: "Doe long, bonny; doe long, me tell you! Bell say d' long, d' long, too."

Uncle Gid: "See that young un! Wal, as I was a-tellin', I was stan'in' a listenin' tu the dawg tunin' of her up, away west on me, an' me a-lookin' that way wi' all my eyes, an' gun a-ready, when all tu onct I hear a bush crack right behin' me, an' I turned my head s-l-o-w, an' by hokey! if there wasn't that tarnal fox, not ten rod off."

Nathan: "Gosh!"

Uncle Gid: "A list'nin' tu Gab'el."

Nathan: "Gosh!"

Uncle Gid: "An' I swung the ol' churn ontu him, s-l-o-w, an' got a bead 'twixt his eyes, an' onhitched an' plummed him right through."

Nathan: "Gosh!!!"

Uncle Gid: "Come tu, I'd forgot my knife, an' hed tu lug him clean hum tu skin him."

Nathan: "Gosh!"

Uncle Gid: "Jest for the notion I weighed him, an' he weighed just twelve pounds and a half."

Nathan: "Gosh! ezactly what a pickerel weighed 'at I ketched on a tilt-up last week."

Uncle Gid: "I hain't no sorter doubt on't. Jes' look a' that young un, will ye? An' I didn't know 't he was—mother, you tell 'em what I said 'baout feedin' Bub, yest'day."

And then, after a prelude of chuckles more visible than audible, except in the sympathetic creaking of her chair, Aunt Milly told how absurdly Uncle Gid had underrated the limits of their grandson's gastronomic range. Besides amusing her audience, he story served to remind her of the raccoon in the oven, and opening the door she released a cloud of savory odor.

"My land!" Nancy cried as she inhaled it. "Whatever you're a-cookin', it smells dreadful good. What is't, mother?" she asked, curiously observing it during the process of basting. "Tain't turkey—it don't look like a pig; what is't?"

"Wal," Aunt Milly answered, prodding the thicker parts with a fork, "it is a—it is a—land sakes! what is the name on't, father?"

Uncle Gid looked intently into the bowl of his pipe as he answered, laconically: "Coshaw."

"Good land; yes, it's coshaw. Why can't I never think on't!" said Aunt Milly.

"Coshaw! coshaw!" her daughter repeated. "Wal, I never heard o' them afore. Jest yu look at it, Nathan."

While Nathan examined it Uncle Gid became more absorbed in the contemplation of his pipe, and so continued till Nathan declared:

"Wal, it beats me, if it hain't a lamb, or a pig, or suthin. What sort of a critter is't? It 'pears tu be a quaderyped."

"No, 't wa'n't the name 't was, gi'n tu us." Aunt Milly shook her head in slow negation. "It's a coshaw, an' it come tu us for Chris'mas, an' that's all we can tell ye about it now. If you don't like it there's pa'tridges—father ketched three yest'day. D'ye druther hev' 'em br'iled er roasted?"

"It don't make no diff'rence tu me," said Nathan. "Accordin' tu the looks and smell on't I do' want nothin'

better 'n that 'ere—what d'ye call it?" And his wife quite agreed with him.

Nevertheless Aunt Milly broiled the partridges, and added a finer fragrance to the appetizing odor that pervaded the kitchen. But these were as nothing to their substantial resources—the roasted raccoon, the broiled partridges, the baked potatoes, the hot johnny-cake and biscuits, the cider apple sauce, the honey, and the pumpkin pies. Of all the dishes that furnished forth the crowded board the prime favorite was the mysterious roast, though none suffered neglect.

Discoursing while they feasted, Uncle Gid told of hunting the partridges, and just missed disclosing the finding of the coons; and when Aunt Milly explained how they came by honey she nearly let the cat out of the bag, or rather the coon out of the tree that yielded the honey; yet the uninitiated were still none the wiser.

As has been at least once reported of a social gathering, it may truly be said of this, that "all did ample justice to the bountiful repast"—even little Gideon, elevated on the family Bible to a working height, plied knife and fork so manfully that his grandfather's heart was filled with pride, while his female progenitors foretold such woeful retribution as ever is prophesied to overtake greedy little boys; but as usually happens in such cases, the prediction was not fulfilled.

"Du let the boy eat; it'll du him good," said his reckless father.

"If you hain't jest like a man!" Aunt Milly said, regretfully.

"If I hain't, I don't scarcely s'pose your darter 'd married me," Nathan retorted, and went into the woodshed in search of a stick suitable for the manufacture of a toothpick.

As with a professional eye he scanned the interior architecture he discovered a fresh raccoon skin nailed upon the boards in an obscure corner.

When he re-entered the kitchen he remarked casually: "I found aout one thing 'baout that 'ere coshaw. It hed rings raound its tail, ju' like the critters 'at I've hearn folks call coons."

There was a period of silence, and no one acknowledged feeling the worse for the discovery.

ROWLAND E. ROBINSON.

Some Yukon Notes.—III.

(Continued from page 263.)

WHILE game is scarce along the upper Yukon, fur, as far as our observations went, is plentiful. Coming up the river on the ice we saw the tracks of thousands of foxes, and scores of lynxes, wolverines and martens. Otters and beavers are said to be abundant in some localities, but we saw none, though the Indians frequently offered us beaver skins for sale or barter. Wolves are more common in the neighborhood of Dawson than on the upper river. It seemed not improbable that the vast number of dead horses along the Skagway trail would attract wolves to that neighborhood this winter, but I was only able to learn of two being killed—one trapped and one shot near Lake Bennett.

Coming up the river we did not see half a dozen wolf tracks in 400 miles. The wolves follow the caribou closely, and are not common at any distance from the large herds. Between the Pelly and Dawson, however, their tracks were frequent on the ice, and a man in charge of the beef raft frozen in in this stretch of river is said to have been considerably alarmed by their boldness.

At the time we recovered our lost boats we determined to build a cabin as a cache for our supplies. While looking for a suitable location for this off the direct line of travel up the river I found a sheep camp on a peninsula between a slough and one of the lesser channels of the Yukon. This camp was the point at which a band of sheep, driven overland, had been slaughtered and shipped on rafts to Dawson. Several horses had either died or been killed at this place, and their carcasses and the offal from the sheep had in time past attracted the various carnivorous animals of the neighborhood to the spot.

From present indications I could see that a wolf or two, as well as several lynxes, wolverines and foxes, were still in the habit of paying occasional visits to the spot, to recall no doubt over dry bones and unnutritious hair the memory of past banquets.

Somewhere in my outfit was a half ounce of strychnine, purchased in Juneau, and I determined to try its effect on this select gathering. Accordingly on my return to camp I hunted up the poison, melted some lard in an old plate and mixed the strychnine with it, and finally after the stuff had cooled cut it up into caramels, in square by ½ in. thick.

Just before dark Mac and I walked down to the sheep camp, but for some unimportant reason we decided not to put out the poison that night. Instead we left the plate and its contents out in the middle of the slue buried under 5 or 6 in. of snow.

That night there was a light fall of snow—half an inch or so—just enough to decisively eliminate old footmarks from any problem of tracking next day after attending to small matters about camp I thought I would go down to the sheep camp and perhaps put out some of the bait. When I reached the spot where the poison was I found that some time in the night previous to the snow flurry a wolf following up our trail had come across it and investigated. If he had eaten any of the poisoned bait he left no token to indicate the fact. The plate seemed to contain as many pieces as before, and as I had not taken the precaution to count them I could not be sure that any had been taken. However, the wolf had dug down through half a foot of snow, and I reasoned that his curiosity would hardly be satisfied by sight and smell alone. I followed up the partly obliterated tracks he had made on leaving, and saw that after the first few rods he had broken into a gallop. The tracks were two and two in groups, something more than 4 ft. apart. I saw that the wolf was making toward an open channel between two islands; and the fact that he was on the jump and after water convinced me that he had taken poison. A little distance further on I saw where he had back-tracked on his water trail, and then where he had gone a second and third time over the same course. When I had traversed a few hundred yards of the slue my attention was attracted by the coarse, raucous note

of a raven, and looking across to the opposite shore I saw several birds take wing. Something told me that the wolf lay there, but despite my conviction I could not rid myself of an unpleasant feeling that I had poisoned somebody's dog as I approached, and saw a great white animal stretched full length on a patch of bloody, trampled snow. But it was a wolf sure enough. Old Lobo, king of the Corrupaw, reincarnated and fallen again a victim to man's treachery. There lay the hoary monarch, a monster of his kind. Our sled measured 7ft. in length, and when frozen stiff this wolf was almost as long from nose to extended hindfeet. His robe was white as the arctic snow on head and neck, and only on his back was there a suggestion of gray. One glazed blind eye and two yellow tusks growing outside his mouth on the same side gave a sardonic expression to the profile that happened to be uppermost. A great gash in his side, torn by the ravens, mixing red with the white of his coat and the white of the snow added to the suggestiveness of the picture—a picture which told with a few direct strokes of a life of rapine and blood ended in blood and rapine.

I doubt if the wolf was dead when the ravens first attacked him. He had fallen down half a dozen times before reaching the last spot, and at several of these places were bloody splashes on the snow. There were also hieroglyphic marks made by the ravens' wings in taking flight that strongly suggested the Egyptian symbol of eternity on the front of the old Tombs Prison in New York.

I shouldered the wolf, which I should say weighed 125lbs., and carried him back to camp. Then I set to work sledding supplies from the wrecked boats to the site of our cache. I had taken the poison from the spot where it was left the night before, but on finding the dead wolf I concealed it in a crevice under the river bank, as I could not well carry it to camp along with the wolf. I thought I would return that evening and put some out. Events which took place a little later, however, caused me to give up this plan.

Some time during the afternoon I noticed a fresh wolf track beside my sled trail that if it had been there before had certainly not attracted my attention. I wondered if the old wolf had come so far in the hours preceding his death. I drew my load up the river bank and back a couple of hundred yards through a thick growth of small spruces to the spot selected for the cache. It was but a moment's work to unfasten the tie rope and throw off my load, yet before I reached the river again I found a fresh wolf track crossing my recent sled trail, and consequently made still more recently.

This was interesting. A wolf was unquestionably following me, possibly attracted by the scent of the other wolf on my clothing, influenced by what motive it was hard to imagine. My partner had gone to Selkirk and would not be back till after dark, but this caused me no uneasiness on his account or my own, for I did not for a moment believe that the wolf would dare attack a man.

Its boldness in following so close on my trail in broad daylight, however, suggested the possibility of securing a shot, so the next trip and thereafter I carried a rifle on the sled.

Just about the time when it should have been sunset—we never saw any sun at that place, owing to the mountains which walled in the river—in rounding the point of an island I noticed where the wolf had come along the trail in my direction, and suddenly sprang off and galloped away down the narrow channel separating the island from the mainland.

The natural inference was that he had been surprised by my unexpected return, and was still in the immediate neighborhood. Acting on this theory, I seized my rifle and ran down the river to a place where I could get an unobstructed view of the ice from shore to shore. I expected to see that wolf, and yet when he appeared, looming up very dark against the snow of the river bank, I could hardly believe my eyes. I only saw him a moment before he disappeared in the timber on the mainland, too far off for a shot. My impression was that this wolf was very dark, and in no wise resembled the old white one we had killed.

Anxious to see if the wolf would again show himself, I remained perfectly motionless in the same spot for several minutes. A red squirrel chattered, and some ravens flew up half way between me and the spot where the wolf had disappeared. Then I heard a twig snap on the river bank directly opposite. It was too cold to stand waiting longer, for my feet were fast becoming numb, but before I went back to the sled I ran across to the mainland, and satisfied myself from the wolf's track that he had run up just inside the edge of the timber, coming as close as he could without exposing himself.

This was my last trip to the cache that night. I did not go near the poison, for as the wolf was in the immediate neighborhood I concluded the chances for his taking it were better if things were left undisturbed. After breakfast the next morning Mac and I started down to investigate. Another light snow had fallen in the night. Showing up plainly in this scarcely 30ft. from our tent, we came upon fresh wolf tracks, made in the early morning hours. To surprise Mac on his return the night before I had cut a small tree and thrown the dead wolf across it directly in the trail, and to this place the other wolf had come. Plainly its boldness was due to its anxiety for its lost mate. Now that it knew conclusively the fate which had befallen him, we concluded this wolf would not delay on the order of its leaving the country. We had little faith in finding it dead, for we thought the death of the other wolf would put it on its guard against the poison. In this we were curiously mistaken, however, for at the sheep camp, a few hundred yards below the spot where the first wolf had died, we found the other wolf dead also, though still warm. It was a she wolf, younger, smaller and darker than the old dog wolf we had found the night before. The top of her back was almost black, and the skin was unusually handsome. From the tracks it was evident that she had taken the poison after she had visited the dead body of her mate. She had dug it out of the snow, upset the plate and eaten half the contents. The indications suggested suicide. The sagacity of the wolf tribe is well known, and this particular wolf had sufficient evidence to make her fully aware of the

cause of her mate's death. At various times on the previous day she had visited the spot from which I had carried him, and though I cannot be certain of the fact, I believe that she knew the whereabouts of the poison long before she touched it. If the taking of the poison were not the act of a grieved nature, why did she return to the spot where it was hidden after seeing the dead body of her mate? Lacking a fixed purpose, the instinct of self-preservation would, one might reasonably infer, have warned her to fly elsewhere. At any

MAC AND THE SECOND WOLF.

rate, I give the facts as they occurred. The incident seemed to me to have considerable interest, and for this reason I have given it in detail.

Several wolverines sampled our poison—or perhaps it was the same wolverine—on several occasions. At any rate we were unable to find that the poison had proved fatal. A red fox which took two or three baits in succession and died very close to the sheep camp was carried off by a lynx. At first I could not figure out what had become of the fox, for the lynx had not eaten him at the spot where he fell for the last time. Here the fox's track had ended, and the track of the lynx which had been following in the fox's trail was the only one in evidence. Had the lynx dragged off the dead fox, I should have understood at once; but the only thing left to show what had become of my

A YUKON MONSTER.

game was the not very noticeable impression left by the fox's brush in the snow at the side of the trail.

Quarter of a mile further on the lynx had gone into a dark nook under some fir trees, and had a lunch off Mr. Fox. I use the term "lunch" advisedly, for the formal meal was not partaken of till by a very devious course he had reached another piece of thick timber nearly a mile further on. Here the snow was strewn for a radius of 20ft. with tufts of hair and a very few fragments of crunched bone. Like the Timbuctoo cassowary who ate up the missionary, the lynx had made a clean job of it—"body, bones, and hymn book too."

I looked the ground over carefully, but could not find that he had carried off anything when he left, or cached any part of the fox under the snow or in neighboring trees. It was somewhat inexplicable that no sign of the skull or vertebrae could be found.

One of Gov. Walsh's Indian dog drivers by the name of Fiddler told me that he saw a lynx drag off a dead

wolverine on the river just below the Hootalingua. He said the lynx was backing and pulling the wolverine after him.

During our short sojourn in our cabin we caught two marten in a steel trap only a few feet away from the bed in which we slept. We had thrown the wolves' carcasses directly behind the cabin; and one night I became conscious of the fact that some animal was gnawing at them. From the noise I thought it was at least a lynx or wolverine. I knew just where I could put my hand on my rifle in the dark, and I got as far as the door of the cabin without making any noise. The door, however, was hung on wooden hinges, and squeaked badly, and as a quiet advance beyond this point was out of the question I pulled it open in a hurry and darted round to the back end of the cabin. Some very dark, small animal sprang into the nearest tree and commenced spitting at me like a cat. By the light of the moon I could make it out in silhouette, head down, slowly coming down the side of the tree. I fired at it three times at random, and without result. Then my partner came out. He had only heard the last shot, and wasn't sure but what that was only a tree snapping with the frost. Meanwhile the marten had gained the ground and disappeared.

Just as I was getting to sleep again I heard the marten come back. I lay there for some time trying to forget him, but I could not sleep for his gnawing. Finding my efforts in this direction were useless, I took the gun and walked leisurely to the back of the cabin. The marten had grown bolder, and this time refused to leave the carcass of the wolf. Instead he poked his head out of the hole made by his efforts, combined with those of the ravens, and snarled at me. His language said, as plain as words could express it, that I was persona non grata, and that he did not propose to relinquish his meal to any new-comer. I took a pot shot at him, distant about 4ft., and missed.

Before I could get to sleep he was back again. I had no trap in the cabin at the time, but it occurred to me that perhaps I might be able to poison the reckless little devil; so I got out of bed, and lighting a candle, mixed some strychnine and grease. The marten with very bad grace permitted me to deposit this in the cavity of the wolf, but by the time I had gotten to bed was back again. He stayed there till daylight, which fortunately was not long coming, and paid not the slightest attention to the poison.

That afternoon I got a fox trap and set it at the place the marten had climbed up on the wolf's body. About dark, as I was coming up the trail with a pail of chipped ice from the river, I saw the marten directly in the trail. He loped along like a rabbit, looking back at me meanwhile over his shoulder. Mac had been thawing the ice out of a tent that day to lighten it, and for this purpose he had built a large camp-fire about 6ft. from the corner of the cabin, where the wolves lay. The fire was still blazing fitfully, and I hardly thought we would hear anything from the marten that night. I was mistaken, however, for just as we sat down to supper we heard a succession of spittings, snarlings and scratchings that told us the trap had done its work. The little freebooter sprang the full length of the chain at me when I reached the corner of the cabin, club in hand, but his fiery spirit went out a moment after at the first rap of the club. Two or three nights after we heard another marten at the same spot. I got up from bed and set the trap with numbed fingers, for it was a 40-below night, and a few moments later we had this one also.

This marten did a very curious thing, for after being caught by the hind leg he crawled through the bowed jaws of the trap, thus twisting his leg almost into a knot. It was a female, fully a third smaller than the first, and so very dark as to be almost black. The warm brown that characterizes most marten was lacking. These Yukon marten have a white patch on their throats, in no way suggestive of the orange so often seen on Maine or Eastern specimens. A Hudson's Bay man tells me that the white is characteristic of the marten from the extreme north.

While coming up the river on the ice an ordinary chinchilla-colored woods mouse caused me more fright and mental suffering than any of the larger wild animals would be likely to occasion. This mouse crawled inside my blankets as I was lying out one cold night, just below Rink Rapids, and deliberately attempted to bite a chunk from off the end of my nose. Nature has endowed me with plenty of nose, and I could easily have spared the piece, but the mouse's method of taking it was very painful—the tooth marks are in evidence to this day—and I sprang half out of bed and made a frantic effort to escape from my small antagonist. When I was thoroughly awake I watched, and soon saw the mouse return to the attack. I secured a stick, and resting on one elbow, endeavored to rid myself of the troublesome thing; and I recalled certain occasions when I had ridiculed girls I knew for being afraid of mice. Finally I almost hit the mouse, and he gave up the foray for the time being, and a truce having been declared, the two armies rested on their arms.

Just at daybreak, however, that mouse got down into the blankets again and bit me on the hand. It was lighter now, and I could see better, and wasn't quite so sleepy; and this time my aim was truer. My partner when awakened in the night had thought I was delirious, and tried to soothe me; but when I showed him the dead mouse and my swollen nose he accepted me once more as a rational being. J. B. BURNHAM.

How does a Buddhist fisherman justify his trade? By arguing, says Mr. Young, that he does not kill his fish, but only draws it out of the water, whereafter the fish dies a quite natural death. We know a better story than that, of Mohammedan lascars on the Eastern steamship lines. No good Mohammedan eats pork. But your Moslem lascar has acquired a belief in the transubstantiating virtue of sea water. So he hooks his chunk of pork to a line, tosses it overboard, and after a reverent pause begins to haul in, hand over hand, to his nasal, slow chant, "Jao suar, idhar ao machee," which being interpreted means, "Away, pig; come along, fish." Experience has proved the practical efficacy of this rite.—*London Daily News.*

East African Mammals.

BY D. G. ELLIOT, F.R.S.E.

(Continued from page 264.)

THE ORYX (*Oryx beisa*, Rüpp). NATIVE NAME, *Beit*.

ORYX are not often seen in the country north of the Golis Range, but their numbers increase as the Haud is traversed, and on the south of Toyo, and in Ogaden they are plentiful. It is a stoutly built animal, about the size of a large donkey, and goes in herds, sometimes as many as fifty or more being seen together. Generally, however, a dozen individuals or less are met with. It is not unusual to find old bulls wandering about by themselves. At a distance it is impossible to distinguish the bulls from the cows, as both carry horns, those of the cows more slender and usually longer than the average of bulls' horns. But this difference in size is not perceptible unless one is very close to the animals. The horns are annulated for two-thirds their length, then become smooth, and end in a sharp point. The average length of bulls' horns is not much over 30 in., although occasionally specimens are obtained that are several inches longer, and the cows' horns sometimes reach a length of 37 or 38 in. They are very formidable weapons, and it is dangerous to approach a wounded oryx. In charging its enemy the oryx puts its head low down between its forelegs, with the horns pointed forward not much above the ground, and rushes at the object of its hate with much swiftness. These lance-like

gazella), from South Africa. This last, a very fine animal, is almost extinct, a remnant being protected on a few farms, but its days are numbered and it will soon disappear.

BIG KOODOO (*Strepsiceros kudu*, Gray). NATIVE NAME, *Golir*.

This is a mountain species, delighting in the lofty ranges amid steep declivities, ravines and broken ground, and occasionally going on to the plains; and when it does so it is probably merely to reach some other range of lofty hills. The big koodoo is a magnificent animal, one of the largest of known species of antelope, possessed of a powerful frame, beautiful coloring, and the male carries a magnificent pair of long, spiral horns. The female is hornless. It keeps near water, unlike in this respect so many African antelopes, and is very shy and retiring, remaining in the most inaccessible parts of the hills it can find, and starting off at the slightest sign of danger or sight of a suspicious object. The easy way in which a bull koodoo can travel over the rocky ground, scaling apparently inaccessible cliffs, and going at speed over the roughest places broken up into defiles and thickly strewn with boulders and broken stones, is wonderful to witness; but the animal goes clattering along, making a prodigious noise the while, with as much ease as a horse would travel on a good road. Koodoo are cunning, and their eyes, nose and ears serve them equally well, but the very style of ground they inhabit, and which serves as a refuge, is one of the means of their destruction, for it is easy to stalk them when the hunter has innumerable objects at hand by means of which he can veil his approach and gain a position near the unsuspecting quarry, from which a deadly shot can be taken. Koodoo go in small herds, usually consisting of an old bull and two or three cows,

eling from one portion of a range to another, and I have known them to leave the Golis entirely and go upon the Haud, as one time three individuals were met with by my party some ten or fifteen miles beyond the Haud's northern boundary, where there were no hills, merely a comparatively flat plain covered by low thorn trees and bushes. They seemed out of place in such a situation, and evidently felt that way themselves, for on being surprised started away in the direction of the distant mountains at the best pace of which they were capable. The color of old bulls is a beautiful blue gray, that of the females and young reddish brown, both sexes having the body decorated with eight or nine narrow white stripes.

[TO BE CONTINUED.]

The Extinction of the Passenger Pigeon.

BEING a bird lover and amateur ornithologist, I take an interest in anything I see written on bird life. In *FOREST AND STREAM* a few issues since the "Extinction of the Passenger Pigeon" was written on.

In many years I have gleaned all the information I could on this fine bird, which once swarmed in countless millions in the eastern part of this continent. What has become of him has never to me been satisfactorily explained.

That this species of the great pigeon family has become comparatively extinct is admitted by all who take an interest in such matters, and there is a reason for it, whether that reason is known to us or not. His being destroyed by storm or by the reckless slaughter of netters and shooters or any other reason I have ever heard I do not think correct. Once so numerous that they darkened the sun, it might be said of them: "As numerous as the sands of the seashore." No human slaughter could have annihilated them. True, the elements might have done so. If so, when and where was it done? It could not have happened on this continent without its being known. There can be no doubt that every animal which once existed on this planet and became extinct had a cause for its extinction; and I have for many years thought I knew the cause for the extinction of the passenger pigeon. I think he was literally starved to death.

The passenger pigeon was a bird indigenous to this country, where he had any quantity of natural food for sustenance. His home and course of travel were along its eastern part, which till the settlers cleared it up was covered with all kinds of deciduous trees—beech, oak, maple, basswood and many other kinds of trees that bore mast in abundance which this bird fed on; saying nothing of the endless kinds of shrubs which also catered for him. The bird did not become extinct suddenly. Where I live in the southern part of Ontario, a dense deciduous forest when I first knew it, he commenced decreasing in numbers about the year 1870, and it took nearly or quite ten years for their almost gradual extinction. Their extinction really was more of a spasmodic than gradual character, but during the years 1870 to 1880 they left that great hardwood forest, which once stretched, solid, from the Niagara River to the Detroit River, and "have never come back any more."

Up to perhaps 1865 to 1870 there was still sufficient bush to supply them food, but every year the axe was doing its sure and to this bird fatal work, till by and by enough natural food was not produced in the forest to maintain him, and in a few years he became extinct. The elements did not hurt him; neither the gun nor the net destroyed him. The settler's axe alone is responsible for his extinction.

L. H. SMITH.

STRATHROY, Ontario, Canada.

A Curious Fox Skin.

CLINTON, Conn., March 5.—*Editor Forest and Stream:* Joel H. Carter, a farmer residing here, shot a fox a few days since, the animal being so peculiarly marked as to excite comment from a large number of veteran fox hunters, by whom its skin has been viewed with interest. No one thus far has seen or heard of a like instance, which does not seem to indicate albinism, although unfortunately the eyes are not in evidence, the animal having been skinned and the carcass left in the woods. The fur is extraordinarily short at every point and inclined to curl. The sides of the animal are of a light bluish or smoky cast, while the entire under part of the body is pink, looking as though painted. The tail is unusually short and resembles somewhat that of a sheep, the hair being also short thereon. In color the tail is of a very light yellow or cream color. The head seems abnormally large. The inside of either ear is a bright bluish shade clear to the tip.

ALLEN W. JONES.

[The skin referred to above was sent on to us for examination, and is certainly an odd-looking specimen. It is woolly and short-coated over the whole body, having apparently lost all its long over-hair, only the short, close, woolly under-coat remaining. The tail appears extremely short, which is in part due to the loss of the long hairs at its tip. The specimen having been submitted to the eminent mammalogist, Dr. J. A. Allen, of the American Museum of Natural History, he has commented on its condition, and writes that he thinks "such a condition in the fox is very unusual, and that the specimen is decidedly abnormal."

We find no evidence of any skin disease which might account for the loss of the long hair, and the time of the year—late February—at which the animal was killed would seem to show that this shedding was not a seasonal change.]

The New Aquarium Superintendent gives his own Measure.

From the New York Sun of April 9.

COL. JAMES E. JONES, whom the Park Board appointed Superintendent of Small Parks in the Borough of Manhattan, began the duties of his office yesterday by taking charge of the Aquarium. Col. Jones was in rare good humor. He established quarters in Dr. Bean's old office on the second floor, and after arranging the furniture to suit his own ideas he sat down, and putting his feet on the desk, lit a long, fat cigar. Col. Jones is tall

THE ORYX.

From "Trail and Camp-fire." Photo by W. Lord Smith.

horns are quite capable of passing entirely through the body of an animal. Oryx seem to be quite independent of water, and are often seen many miles from any place where it could be procured. They frequent the waterless, treeless plains, such as Toyo, Silo, etc., in herds sometimes of large size, and subsist upon the harsh dry grass common to such localities. The skin of a bull is very thick on the neck and withers, in some cases as much as 3/4 in. thick. The natives select this part of the hide to make their shields, which are sufficiently tough to stop any spear or arrow. As the bulls are very pugnacious, no doubt their tough, thick hides are a great protection against the lance-like horns, and save them from being run through this vital portion of the body.

I have frequently seen bulls fighting and thrusting with their horns, ending in the weaker being chased for a long distance by the victor, amid a cloud of dust. Oryx are not especially wary, but their sight is very keen, and they depend more upon their eyes to detect danger than either upon nose or ears. It is not, however, a difficult matter to get within fair shooting distance of a herd, provided due caution is used and the ground is suitable for stalking. The natives frequently hunt this animal on their ponies, and endeavor to spear it, and every year a number of men and horses lose their lives, transfixed by the sharp horns of the angry game. Oryx run with considerable speed, and are able to keep it up for a long time, but the natives surround a herd and are therefore able to meet the animals, no matter which way they may run. Calves are curious-looking little creatures, something like those of the domestic cattle, having a hump upon the shoulders. They soon become quite tame, and one we had for a short time would readily suckle a goat, although the latter was not half its size. The horns at first are mere knobs with the points turned to one side, and these ends do not become straight until a length of several inches is attained. Calves utter a sound between a bleat and a bellow, and this expresses either fear or hunger. They run even more swiftly than the adult, and it is wonderful to see the little creatures keeping up with a herd in full flight, frequently taking the lead and keeping it. Oryx are often seen with hartebeest, aoul, etc., peacefully grazing on the plain together.

This species of oryx is the second largest of those known, being exceeded in size by the gemsbok (*Oryx*

with their calves, if there are any. Occasionally a young bull may be of the party, but if that is the case he is usually too young to excite any jealousy in the lord of the family. The cows are the most watchful, and are always on the lookout to perceive approaching danger, and the bull trusts almost entirely to them to give him timely warning. The note or call of the female when she is startled is a kind of bark, which, when heard, puts all the members of a herd on the qui vive. This and the succeeding species never associate together, for although the big koodoo may go down on the plains stretching away from the base of the mountains, his small relative never ascends to the heights on which he loves to dwell. They may "meet by chance," but I fancy the lesser koodoo would have no especial desire to prolong the acquaintance.

A bull koodoo will stand about thirteen hands high, and the horns measure sometimes as much as 60 in. along the curve. These, however, belong to South African individuals, which seem to have larger horns than their Somali brethren. Those of the latter country rarely exceed 50 in. on the curve and 3 ft. high, i. e., from base to tip. The largest we procured were 38 in. high, and 49 along the curve. In Somali-land this fine animal is becoming scarce, as many are killed every year, and it will not be long before this fine antelope will have disappeared from that portion of East Africa. In South Africa this species is still quite numerous in the mountains in the vicinity of Delagoa Bay, and as that is one of the worst fever districts perhaps to be met with on the continent, the koodoo may be found there after the race has disappeared from more healthy localities. A fine head of a big koodoo bull is a great trophy for a sportsman, and all desire to possess one, but it is a question whether even to obtain so coveted an object is worth while to endanger one's life, for the African fever is something that one can get on just as happily without, even if he never obtains any knowledge of it. In certain parts of South Africa, such as the country around the Zemberi River, the big koodoo does not confine itself to the hills, but is found in the thick bush along the banks of the streams, and in the thorn jungles where these are abundant, in this respect being very different in its habits as practiced in Somali-land, where, as I have said, it is almost entirely an inhabitant of the mountains and lofty hills. It seems to be a very restless animal, and wanders a great deal, trav-

and angular. He said he was fond of fishing. He looks like a man who would sit in a boat all day in the broiling sun, watching for a bite. When asked by a Sun reporter how he came to assume charge of the Aquarium, Col. Jones said:

"Well, you see, it's this way. I was appointed Superintendent of Small Parks and all the buildings therein. The Aquarium is in a small park; therefore I took charge. The management of this place is only an incident in the duties of my office."

"What is your opinion of Dr. Bean?" asked the reporter.

"Oh, he was all right in his way," replied Col. Jones, "but he was too darned scientific."

"Don't you believe he was a good man for the place?" queried the reporter.

"Oh! Lord, yes; he was a good man, but he wasn't practical," answered the new superintendent. "Everything with him was science. Now I am a practical man, but I believe in science too, because I am a graduate of a college myself; but there is such a thing as too much science. Do you know how they used to test water here to find out whether fishes could live in it or not?"

The reporter confessed his ignorance.

"Why, by scientific methods," replied the Colonel. "But I've got a way that beats that. The proper thing to do is to put a fish in the water. If it lives for twenty-four hours, why the water's all right. If the darn thing dies, why the water's all wrong."

"Do you intend to make any changes in the present force?"

"Well, not any to speak of. But I can't keep 'em all. Some of them are not fit to be chambermaids in livery stables. You can't expect me to keep them, can you?"

Wild Pigeons in Vermont.

MILTON, Vt., March 28.—*Editor Forest and Stream:* In your last issue I read several interesting letters regarding the wild pigeon from various sections of the country. We have a few pigeons left in Vermont, and I am certain that they nest here. During the last five years I have seen altogether probably fifty birds, sometimes small flocks of five or six, but generally single individuals, and I am positive that one pair at least raised a brood in this town last season. Old residents here say that in their boyhood pigeons were in such abundance that they were a constant source of menace to the grain fields, to such an extent that boys and men were hired by the farmers to watch the fields and frighten the flocks away. It is also said that enormous numbers were caught in nets and were shipped to the larger cities. This was about sixty years ago. KENEWAIL.

Pet Rabbit and Pet Dog.

Editor Forest and Stream:

The article on the rabbit in this week's issue calls to mind a family of rabbits under my observation. The father rabbit can do battle with the family pug dog. I have seen the rabbit turn on the dog after the dog had worried him and chased him over the yard, and have also seen him bite the dog in retaliation for his annoyance to him. It is quite amusing to see them chase each other around and quite as funny to hear the dog yelp when the rabbit nips him on the ear with his sharp teeth; and he knows his danger, for he keeps his distance when pursuing him; experience has taught him, through numerous bites, to keep "so near and yet so far" from those squirrel-like teeth or suffer for his temerity. Spring in Montana.

BOZEMAN, Mont., April 8.—Saw the first robin on March 29, and phoebe bird on April 1; the snow is nearly gone in the valley, but several feet deep in the mountains. H.

Game Bag and Gun.

After Shootin's Over.

NORVELL, Mich.—*Editor Forest and Stream:* I've just bin a-sizin' up my fall ketch o' fur, consistin' of three kid rats and a white stripe. Now if you ain't too unfavorable to the notion I'd like to swap 'em fur subscripshun to your paper. Folks say it ud be safer a-sendin' on 'em through the mails nor clear money. They say that postmasters an' such fellers wouldn't be no ways so likely to tamper with 'em. I thought I'd let the paper stop, seein' she'd run out, but when I come to think on't I can't seem to endure the notion when, now the shootin' season is over, with fur good, an' the two-bar'l scatter gun has bin cleaned up an' stood away ag'in the season o' '98, I've got to have sumthin to kind o' steady my equilibrium, so to speak.

O' course there's our last hunt to think about on the last day o' the season. We had a fine time. The fresh snow that fell the night afore got me right up early in the mornin'; chores all done up afore breakfast; an' after that I slipped on the huntin' togs an' sot out to meet my old friend F. H. at the app'inted place. When I got there the first thing he said: "Say, ain't this snow a corker? We'll make up to-day for what we didn't on some other days." An' we did too. When it come night we'd bagged 1 pa'tridge, 4 rabbits an' 18 quail, an' lots on 'em got away. Didn't do no big shootin', o' course, but then we got enough for anything but a game hog.

Waal, that time is past an' gone, an' as I said afore, the scatter gun an' game bag an' things has bin laid up, an' there ain't nothin' much for me and the old dog to do in the huntin' line now; an' some of the days seem kind o' long and lonesome like. I notice about every mornin' the dog comes round with an inquirin' look in his eye to see if I ain't goin' huntin', an' when I get ready to go out he'll begin jumpin' round an' round, tryin' to catch his tail, an' knockin' things over, so tickled to think we're goin' huntin'. When he sees it's nothin' but an old rat trap or a bit o' choppin' I'm goin'

to look after he gets disgusted like an' turns round an' goes back to the house an' begins barkin' like somebody's come, to make the wimin folks open the door sost he can slip in by the fire.

An' then ag'in some days he gits to feelin' so rampant that he'll go trailin' off after birds an' stuff by himself an' scarin' on 'em up, an' then I have a real spell with him, a-callin' him in an' tryin' to make him understand we're livin' under game law government now; that we've got to let the birds and things alone; that he mus'n't even snuff of their old tracks in the snow, 'cause it might lead to disturbin' on 'em out o' season, an' that's ag'in the law, besides bein' very undogly. An' then he'll come an' put his paws up on me an' I hav' to rub his nose an' fumble his ears for him an' tell him I know it's lots o' fun, but we've got to let 'em alone an' wait till the birds hav' come back an' builded there nests an' hatched out there young uns an' gone away ag'in, an' the old bullfrog down in the pond has got done singin' "Jerry Louks, Jerry Louks," an' the maple leaves hav' turned yellor, an' the mushrats hav' beginded buildin' there houses around, afore we can ever go huntin' ag'in.

But it's no use; don't do any good; he only holds his head kind o' sideways an' looks at me, an' then gits down an' walks off waggin' his tail, oneasy, f'gety like, snuffin' around at things. I dunno wot makes it, but seems so his longin's fur huntin' be all the time a-sproutin' up an' a-pesterin' on 'im, an' I'll be glad when shootin' times come ag'in, sost I can let him go an' foller the ways of his natur'.

An' yet, after all, when I come to think on it, I dunno as his longin's be so very much longer nor mine. Mebby they be, but I ain't sure on it. As I said afore, some of the days seems kind o' long an' lonesome, now shootin's over an' the gun an' things is put away. Course I'll hav' to take the gun out of its case occasion'ly an' look through the bores to see how she's keepin', an' then I wouldn't wonder a mite if I put 'er together an' took a squint or two along over the bar's jest to see how familiar like she comes up. No particular need o' doin' the latter, as I knows on, but then I notice the true sportsman seems to enjoy doin' such foolishness. Don't you know he does? Some way the holdin' an' heftin' of the old gun seems to kind o' remind him of about some o' the happiest times of his life. He gets to thinkin' about how he use' to git up early in the mornin' an' take down the old gun, put a few shells in his pocket, an' slip out o' the house an' off down to the lake or river an' wait for the mallards to come in; or mebby he'll think o' the day when he stood on the log an' shot at that woodcock an' the old gun kicked him off in the creek; or some o' the time shootin' quail or pa'tridge along in the fall, an' comin' back at night with his bag full o' game, a-whistlin' some old tune an' feelin' mighty good-natur'd to'rds everybody most.

But now I s'pose there's bin a day in the experience of every shootin' man when he's gone out a-huntin' (an' a fus-rate day for shootin' too), an' banged away all day an' never got nothin' septin a shitpoke or some such stuff, an' when come night kind o' dragged himself along back home, the wind a-moanin' across the muzzle of his gun bar'l, a-feelin' leg-achy, an' mad at the dog, an' mean 'nough to go off in the woods an' hide, hatin' like sixty to meet his folk. Ain't ye never noticed any such feelin's—leastwise when ye was a boy, a-livin' in the fear an' admonishun o' dad? But that's all forgotten the next time he goes a-huntin'. It's one o' them fine days 'long in the fall, after we've had a frost. The sky is clear an' bright, the grass an' leaves glisten in the mornin' sunshine, the air is still, the leaves come flutterin' down, an' you can hear the squirrels a-barkin' an' droppin' nuts out o' the trees way off in the woods, an' if you listen real sharp like's not you'll hear that old pa'tridge that's got away from ye so many times a-drummin' way over there in the brush lot, an' hear the hounds a-bayin' up in the hills miles away. Bimeby the old dog begins trailin' along through the grass up to'rds that old rail fence, an' then putty soon he gets to crouchin' an' creepin' along, careful like, till jes' afore he comes to that clump o' bushes on the furdur side o' fence, an' there he stops; he's got 'em. Now he don't put up the birds an' begin shootin' on 'em right off. No, oh, no; not if he's built right on the inside. He'll stop a bit an' take a look at the dog a-standin' there with his for'd foot lifted up, his nose an' tail in line an' his eyes a-glowin' like balls o' fire, silooted as he were ag'in the bresh. He wouldn't use any cuss words on him now; no, sir; best dog in the State now. But while he's standin' there admirin' that pictur', all to onct—whir-r-r! up goes a pa'tridge; whir-r-r! 'way goes another; an' quicker'n lightnin' he fetches the gun up an' lets go with the right bar'l an' then the left. After the smoke has riz up an' the sound of his gun comes rollin' back through the woods, two little clouds o' feathers that he sees driftin' away in the air marks the beginnin' o' them days that he'll love to yarn about with the boys round the stove in the store, after his shootin' seasons are closed on him never to open ag'in. H. R.

P. S.—Hope ye won't be unfavorable to the tradin', cause the white stripe is prime fur.

Belknap County League.

LACONIA, N. H., April 9.—*Editor Forest and Stream:* The first annual meeting of the Belknap County Fish and Game League was held in this city on the afternoon of the 5th inst. A good attendance was present, and matters of much importance to those interested in fish and game were discussed. The following were elected officers for the current year: J. E. Wilson, President; S. S. Jewett, Secretary; A. W. Dinsmore, Treasurer; all of Laconia.

In the evening the first annual banquet and social meeting was held at the Eagle Hotel in this city, which was a pronounced success in every way. Sixty-two gentlemen sat down at table. After the banquet short speeches were made by Messrs. Shurtleff and Wentworth, of the State Fish and Game Commission; also by Messrs. J. E. Wilson, J. T. Busiel, E. P. Jewell and S. S. Jewett, of Laconia; Thomas Cogswell, of Gilmanton; W. R. Clough, of Alton; and others.

The Belknap County Fish and Game League, while only a year old, has become a power in this section in all matters relating to legitimate sport and the prop-

agation and protection of fish and game. The League has 141 members, and includes in its membership many of the most prominent men in this section of the State. The coming year promises to be one of exceeding activity for the League, as it purposes to do everything possible to stimulate the interests of legitimate sport and the protection of fish and game.

Maine Hunting Tax.

AUGUSTA, Me., April 4.—*Editor Forest and Stream:* I send you article written by Col. Farrington. At his request I send it to you. I hope you will publish it, and make such editorial comments as you think appropriate. L. T. CARLETON.

Editor Forest and Stream:

Much of late is said and written regarding changes in our fish and game laws, for the purpose of making them more effective for the preservation of game.

The thought naturally is, when violations of the law are called to one's attention, that the remedy lies in enacting more stringent laws. It is my intention in this communication to call public attention to the condition of things regarding the violation of the game laws, the reason therefor, and suggest a possible remedy or what may lead up to a better condition of things.

In the first place I claim that the laws affecting our fish and game are better enforced than most other laws upon our statute books, and that public opinion is improving in sustaining an enforcement of law, and improving our fish and game preserves.

But I also admit that there is need of a better protection of our fish and game (game especially), and a better appreciation of its care. While public sentiment is improving, and the State at large appreciates more and more each year the great advantages derived from these resources, there will be for many years more or less violation of law, same as the lawless violate any and all law when it seems for their interest to do so.

How to meet the demands in the direction of best preserving our game resources is the one living question that calls for the best judgment of every person who would see the State receive the greatest benefit from them. What is best for the State at large, not what is best for this or that section or interest, should be the problem to be solved.

To that end let me make the following suggestions:

First, as I have said to many persons, the State receives its greatest benefits from its fish resources—very much greater than from its game—for from its fishing privileges come thousands of tourists who spend many months at our inland resorts, by lakes and ponds, annually leaving large sums of money.

This feature of the State's visiting business may be increased many fold by the increase of our best fish in waters now stocked, and by stocking many waters well adapted for their breeding. In this direction I would turn the attention of those desiring to make the most of these privileges for the State.

Let the fish and game business be separated. Let the appropriation for the preservation and culture of fish be at least \$25,000, which sum would show in ten years remarkable results in fishing resorts and a consequent increase in visiting tourists and their families. Its benefits would be felt in almost every hamlet in Maine in one way or another. The tax upon a valuation of \$2,000 for this amount would be about 20 cents, and I do not believe that the taxpayers of the State would raise the least objection to it.

It is the big game and its care which has led up to the most criticism, and which creates the most discontent. Do not understand that I would advise the abandonment of the care of our large game, or less attention to its protection and preservation. On the other hand, the method suggested of dealing with it would to my mind lead up to the best possible results.

I assume that our fishing interests are general. Also that our game interests are mainly sectional. In other words, the benefits coming from our fishing resources are general in their scope, and that the benefits coming from our large game accrue to certain localities and to certain individuals or corporations. To be more definite, those whose business it is to care for the sportsmen, hotels, guides, steamboats upon inland waters, and those carrying them by rail, or transporting their express, receive largely the benefits derived from our large game.

These interests are mostly in one part of the State, or rather a large part of the State only indirectly and remotely receives any profit from the preservation of large game. Therefore it is and must be sectional in its benefits. I do not wish to be understood as saying that it is not of sufficient moment and its benefits general enough to demand the care of the whole State, if that was the only and best way to preserve it. But I feel that there is a better way, fairer and more just.

Having appropriated \$25,000 for fish and fishculture, I would compel every non-resident person who desired to hunt moose, caribou or deer to pay annually \$5 for that privilege, and each resident of the State \$1 for the same right.

I have always opposed a license fee upon non-residents, and would now, if it did not apply in some measure to the resident. Laws to be accepted must be fair and just. To tax the non-resident alone is not a just or fair law to my mind. To tax the resident as much as the non-resident would not be fair or just because he is paying his proportion of the appropriation for the care of fish.

The non-resident, who would feel injured by being alone taxed, would see that there was in this no attempt to take unfair advantage of him; and the resident, it would seem, ought to be willing to pay something for the preservation of a kind of a game he desired to hunt.

It was stated in the report of the Fish and Game Commissioners that some 7,000 sportsmen from out of the State came here to hunt large game last year. Suppose 5,000 should come—and I see no reason to reduce the number—a tax of \$5 would give \$25,000; and if 5,000 in the State hunted large game we would have \$30,000 for the preservation and protection of large game.

These two amounts, for fish and game, would make Maine's fish and game interests grow marvelously.

I would then give additional privileges, the right to ship game lawfully taken to the homes of those desiring to do so, and any other reasonable privilege.

I would go further, and without hesitation separate the Commission by making one of them a game protector, and he should be intrusted with the care of game and the enforcement of the game laws. The other two to be intrusted with the care and culture of fish, and each advisory regarding both fish and game interests.

The reasons why this seems to me the best way to deal with our fish and game matters are to my mind many, but it would be too great a demand upon your paper to print them at this time.

The bare proposition for the consideration of those interested is submitted with a view of improving our laws, and of putting firmly upon reliable grounds our great interests in fish and game. E. C. FARRINGTON.

Maine Guides.

STATE OF MAINE, Office of Commissioners of Inland Fisheries and Game, Augusta, April 8.—*Editor Forest and Stream*: The attention of the Commissioners of Inland Fisheries and Game of this State has been called to your leading editorial in your issue of April 9, entitled "A Suggestion to Maine Guides."

With your permission, we wish to point out what we conceive to be some of the erroneous statements contained therein, and therefore wrong conclusions to which you seem to have arrived.

Permit us to say, however, in the beginning, that we welcome all discussion and fair criticism, to the end that errors may be discovered and corrected and the best attainable results secured; therefore, if your editorial is intended to point out wherein the guide law can be made better, improved by amendment, we are grateful for your suggestions; but if, as it seems from reading it, it is intended to bring the law into disrepute and create and foster antagonisms, turning over the whole question of game protection to the guides' associations alone, then we wish to take issue with you squarely and point out wherein you mistake many of the essential features of the law, and mislead your readers as to what it really is.

You say: "No examination is required to determine whether the applicant possesses any of the qualifications which might be deemed essential," etc. You have inadvertently fallen into error in this particular, and your broad statement is calculated (not designedly by you) to mislead. It is equally erroneous, whether applied to the law itself or to the course pursued by the Commissioners. The words "deemed suitable to act as a guide" in the paragraph quoted by you were intended by the Legislature to have, and must have, some significant meaning. This, at any rate, is the view we have taken of it, and have been governed in our official conduct accordingly.

Permit us to state the existing conditions at the time the law was proposed and enacted, and we want here to state broadly that we do not desire to enter upon any elaborate argument to defend this law, for it needs none; it is too deeply cherished by the average sense of our people to require it. One short year has demonstrated its vast importance to our fish and game interests, imperfect as it may be; but the idea contained in it is regarded by a great majority of our people as the key to the situation—as the rock upon which to build. One of the principal arguments made before the Legislature when the bill was under discussion was that "at certain seasons of the year there were not guides enough, and at such times many people got a chance to earn a few dollars who could not pass a successful examination and get a certificate, and therefore great injustice would be done." The Legislature was impressed with this argument, and the bill as originally drawn was therefore modified in this respect, to obviate this objection to some of the guides, and others—now these very ones turn around and condemn the law for omissions they asked for and got. Still there is in it sufficient to permit the Commissioners to refuse to register any one "deemed unsuitable." You are again in error when you assert: "The veriest greenhorn, if he send in his application, and the dollar with it, receives a license." You have been grossly misinformed in this respect. The fact is, the Commissioners have refused to issue certificates to sixty-three applicants who "sent their application and the dollar," and the dollar was refunded. We have been very liberal in granting certificates of registration. We intended to be; we preferred to err, if at all, in favor of the applicant at the start. The guides live in fourteen counties; many of these counties are no larger than some of the New England States, one great game county alone being nearly as large in area as the whole State of Massachusetts. They were strangers to us, and to each other, and it was a seven days' wonder when it was discovered that there were more than 1,300 of them, only five of whom but claimed they had been employed as guides for two years or more. We were compelled to rely upon human testimony in a majority of cases as to their "suitableness." We were imposed upon in many instances, and certificates issued that ought not to have been; but the registration is yearly, and this year we hope to make fewer mistakes and shut out more incompetents, for we are constantly getting better acquainted.

I trust that we have said enough to show that the granting a certificate of registration "means something more than the mere fact that he has paid a dollar for a badge," and herein you again greatly mislead.

No official badges are provided for in the law, and none have been issued. The fee paid for registration is not for a badge at all. We procured a few badges and let all the guides who wanted one have them at what they cost at the manufacturers.

We fully and heartily indorse what you say about guides forming associations. The chairman of the Commission, so far as we know, was the first man who publicly advocated this and urged guides to organize. We welcome guides' organizations, and always assist in every way in our power in securing them.

The great fact, Mr. Editor, must not be lost sight of that the fish and game in the State belong to the people of this State; this fact has been fully recognized and enunciated by the United States Supreme Court.

Our people have taxed themselves many hundreds of

thousands of dollars to propagate and protect it, and we do not enact laws for the guides alone, nor for non-residents alone, but seek to enact such wise laws as will best subserve the material and moral interests of our own citizens, ever keeping in mind the sublime fact that the citizens of all the States are citizens of our common country.

But speaking of the guide bill, Mr. Editor, we regard registered guides as being charged with certain responsibilities, and we have labored to impress this idea upon them. We find that many are disposed to accept this responsibility, and have honestly tried to assist us in many ways the past year, and are pleased to say that they have assisted very materially by their influence, and in many regions have doubtless saved the lives of much game. The old idea that they must close their eyes and ears to all that is going on around them is rapidly dying out, apparently, and considerably over half of them have corresponded with us the past winter, given us information by which we were able to successfully prosecute violators of the law, assisted wardens freely when in their vicinity, and in many cases have openly and in manly style informed the little world around them that future poaching must stop, and that they should inform the authorities of the facts, as far as able, if it did not stop.

The past winter being favorable for poaching, it would be strange if none was done; but as we can easily show you, the most of the crooked work has been done in regions where there were few or no guides.

The guide law is a jewel for us. It has helped very much undoubtedly. It will help us more as it is better understood, and the guides learn that something is expected of them, and that they have a duty to perform. They are expected to be honest, capable and truthful, sober and industrious when employed, willing to lend their influence to protect fish and game; in other words, we expect them to be loyal to the cause, and as fast as practicable shall try to weed out such as are not.

We are fully aware that there is a certain class of so-called sportsmen who like to come to Maine during the summer months, hire guides, go into the woods ostensibly on a fishing trip, with rifles, and kill deer. These men are unanimously opposed to the law requiring guides to be registered, and those guides who have been employed by this class, fearing they would lose their customers, are opposed to the law, and these two classes have made about all the noise we have heard against the law.

There are a few guides, and we are pleased to say that there are but few of this class, who on every occasion denounce the law and its authors in unmeasured terms, and they are prolific writers and talkers. A prominent member of a guides' association not long since took it upon himself to formally order a game warden not to report to us any violations of the law.

A few have refused to comply with the law requiring them to report to us the amount of game taken and days employed.

We regard the very mainspring of what opposition to the law there is, the fear that it will in some way interfere with fishing parties who wish to use Winchester rifles for fish poles.

There are hundreds registered as guides for inland fishing alone, and their certificates restrict them to a certain county, while others are registered for forest hunting alone, and are restricted to a given territory, while others known absolutely to be first-class guides are unrestricted. This is the system upon which the guides are being registered this year. It was not adopted last year except to a limited extent, because of the fact, as stated above, that we were strangers to a very great extent, and the time was too limited.

When the guides of Maine, to any great extent—should that time ever come—refuse to co-operate with the authorities for game protection, and visiting sportsmen egg them on and applaud and counsel such a course, that time will mark the hour when our Legislature will cease taxing the people for the protection of game, and the great herds of deer and moose that now roam over our almost limitless game preserves will disappear forever. Very respectfully, L. T. CARLETON, Chairman of Commissioners of Inland Fisheries and Game.

Mr. Wallihan was not Responsible.

Editor Forest and Stream:

In an editorial article entitled "Books on Big Game," published in "Trail and Camp-Fire," the third volume of the Boone and Crockett Club, occurs the following: "A new departure, that of photographing wild animals in their homes, was taken in Wallihan's 'Hoofs, Claws and Antlers,' although Mr. Wallihan greatly marred the book by combining with the genuine photographs of wild animals a number of 'fake' pictures of stuffed animals."

Mr. Wallihan has written to us complaining that injustice has been done him in this sentence. He states that he had nothing to do with the publishing of "Hoofs, Claws and Antlers" other than to furnish prints of a few of his game photographs and to write descriptions of them; that the matter of inserting the pictures of stuffed animals was mentioned to him by the publisher, Mr. Thayer, which proposition he protested against and opposed to the best of his ability, and that until he saw a completed copy of the book he did not know what was in it. He asks that the error be corrected, if there is any possible way in which it can be done.

It was inevitable that the responsibility for these fake pictures should rest on Mr. Wallihan until he had publicly repudiated them, as he has now done. We are glad that Mr. Wallihan makes a protest against the unauthorized use of his name by his publisher, and that we can inform the readers of "Trail and Camp-Fire" that Mr. Wallihan was as much annoyed at the fake pictures in the book as any one could have been. He thus authorizes us to make public the fact that these pictures were printed in the book without his knowledge and against his wishes.

Mr. Thayer's conduct in the matter speaks for itself, and requires no special comment, but it may be said that acts of this kind are precisely those which tend to bring discredit on persons interested in sportsmanship of whatever kind.

GEORGE BIRD GRINNELL,
THEODORE ROOSEVELT,
Editors of "Trail and Camp-Fire."

CHICAGO AND THE WEST.

Snipe are In.

CHICAGO, Ill., April 7.—The jacksnipe have arrived, and the end of the week will see many good bags made. The birds are reported from Shelby, Momence and Davis, all on the Kankakee marsh, but are still wild and erratic, not having yet quite settled down on their feed. The ground is rapidly improving in condition. The next two weeks will show good sport. I would again recommend Koutts, Shelby, Momence, Davis, Swift's Siding, as points which ought to be good now and better within ten days. Last Monday Billy Mussey killed 23 jacks along Mill Creek, on the Maksawba Club marsh. Mr. Mussey, Mr. Organ and others will go to that club at the end of this week and try again for the birds. So will John Watson. The latter has a deep and undying grudge against the jacksnipe, dating back to some ancient and unrecorded day. John Watson was refereeing a pigeon shoot yesterday, when he was told that his friend Mussey had killed 23 snipe, the first of the season, this week. After that Mr. Watson was so agitated that he could hardly see straight, and he privately informed me that he didn't think it was right for Billy Mussey to kill those snipe, because they belonged to him. When last seen John Watson was hurriedly calling for his rubber boots. A great many others are also calling for their boots, and within the next five days many a long bill will bite the mud of Indiana. It snowed a few lines here in Chicago one day this week, but the weather is warmer now, and the shooters may be sure of sport, if one can ever be sure of anything connected with the unprincipled jacksnipe.

Cleaning Up.

Warden Loveday is just cleaning up his season's grist of violations of the game laws, and has made several long jumps this week in reaching a few choice malefactors in widely separated portions of the State. There was a man out at Dixon, in Lee county—Mr. S. C. Argreaves, said to be a member of a local gun club and of the Illinois State Sportsmen's Association. Mr. Argreaves has plenty of money, and did not need to hunt for the market. He hunts in many parts of the land, and has a good time generally, according to the story; but he has not been too well-to-do to be above shipping game to market, though he is a good friend of the State's Attorney, and has stood well in his community. Well, Mr. Argreaves went on shipping game—rabbits, even rabbits—and quails, and that sort of thing, and at last Warden Loveday found too many quail mixed with the rabbits. He arrested Mr. Argreaves for selling Illinois quail, and the rich market hunter has contributed \$205.50 to the cause of protection. He has promised to reform. "Stop the sale of game."

Mr. Joe DeWolf, of Assumption, Ill., is a grocer and commission man, who ships, or did ship, his game to Chicago. Mr. DeWolf had a leaning toward rabbits, but he got confused one day, and allowed fifty-four illegal quail to fly into his rabbit box. These Warden Loveday found in due course at Chicago. Mr. DeWolf was very penitent, and could not see how those quail could have become tangled up with the rabbits. He talked so sweetly that he was let off with \$95.85.

Mr. William Kroesch, of Union Hill, on one of his busy days, got together a box containing twenty-two quail, three prairie chickens and two doves, and merrily sent them off to Chicago, where everything goes, or where everything used to go. Warden Loveday held conversation with Mr. Kroesch over this, and the latter showed fight. He always had sold game when he liked, he said, and he always would. He was treated to the solitary bird act, which usually brings the tough ones to time. He was fined for selling one bird, with costs also assessed against him, of course. Then he was arrested, taken to jail, brought out again, fined for another bird with costs, and sent back again. At about the third bird he threw up his hands, saying he did not want to be engaged in this sort of thing all winter. He was therefore allowed to compromise on \$130.

Warden Loveday has one case to try in La Salle county, where a man has been trapping prairie chickens in the spring and shipping them to Chicago markets. The name of this man he does not yet care to divulge. In this case the shipment was made "by number," the consignee not daring to sign his own name, which is known by its number on the books of the house to which he ships. This is one of the little dodges of the highly moral game trade on South Water street, of this city. In this case the dodge will not serve. A man who will trap prairie chickens in this State at any time, let alone in the spring, ought surely to get the limit.

I wonder if the general public would fall dead if it really knew the extent of the trade in game? Now Illinois is a very poor State for game these days, so poor that the dealers say frankly that they do not care what we do with the game of this State, just so no one interferes with the trade of other and better States. Yet Mr. Loveday tells me that one man, by name of King, at Carrier's Mills, in this State—a little place of no importance—admits that in one season alone he himself shipped to one firm in Chicago 1,750 dozen, or 21,000 birds in all, of quail alone, saying nothing of other game. Mr. Loveday saw the man's books and knows this to be true. This is what one man in one town did, and what one firm here received from one shipper of one sort of game, in a State which is not important to-day as a field for market hunting. Is it any wonder that our game is fading away? Is it any wonder that the main concern of sportsmen to-day is to take measures to stop such doings? If we could uncover the great warehouses of Chicago, how many thousand times 21,000 quail do you suppose would be displayed to the public, which is absolutely ignorant of the tremendous totals of this business? Add to this New York; add to this Boston. Is it not a wonder that the name of sport has not been wiped off our calendars? And if we could stop these markets, what would not be the revival of sport in this country!

In view of such figures, it is with especial comfort that one hears now and then of good, stiff blows landed on this foe. I have spent some time in recording the Kewanee fiasco in which an abortive attempt was made

to break up the stronghold of H. Clay Merritt, of Kewanee. The former warden quit this case, for some reason or another, and nothing decisive ever came of it. Merritt was fined in the upper court for the birds he actually sold and sent out during the close season, but the replevin suits by which he retained possession of 27,000 head of illegal game were never pushed, and he kept his game. The vital point of the affair, therefore, was never touched upon, which of course was the question whether a dealer could hold over game to the next season, and not forfeit title if his game was discovered. In brief, it was the question whether putting illegal property on ice makes it become legal. Merritt therefore went on with his trade in game very much as before, but relied on the New York market, not daring to trust his stuff in Chicago. He got picked up in spite of his care, and then he labeled his contraband stuff as "poultry," and tried again for the New York market, not daring to trust his stuff in Chicago. He got picked up in spite of his care, and then he labeled his contraband stuff as "poultry," and tried again for the New York market, not dreaming that he would be caught in transit. Yet that is just what happened, Warden Loveday falling upon a fine lot of it not long ago. He has brought suit against this old offender in the Circuit Court of his county, the amount being set at \$50,000 at the lowest. This time it is very likely that Mr. Merritt will not see the case dropped or compromised. This is what he can be fined for having turned loose out of his freezer. Not even yet will the State of Illinois, by its warden, tackle the graver question of what shall be done with the birds which are on ice and which ought to be confiscated just as much as those which he sends out from his freezer. The lawyers say that the confiscation of such game would be "unconstitutional." It seems to me I have heard that word before. It might be very well for us to have our Supreme Court declare it unconstitutional, and not leave it to the lawyers or to the dealers. When we can open the doors of the freezers at the end of the selling season we have won our fight all over the West and all over the United States. But even if we cannot, it is a comfort to think of Mr. Merritt's confiscated "poultry," which he was hopefully sending down to New York.

One more word, brethren, and I am done. Chicago is a big market for game, but it is not the only one. Out on the Pacific coast there is also a demand for game by men who can't shoot it. The Elsinore, Cal., Press has the following item about the business done by just two market hunters:

"George and H. Atkins, two young men who have been shooting wild ducks for market the past season on Lake Elsinore, kept an account of each day's results. From Oct. 17 to Feb. 28 they killed and shipped 5,223 ducks and 88 geese. Of these 2,811 were of the variety known as spoon bills, the balance of the 5,223 being distributed among the other varieties. There were several other market hunters shooting on the lake during the season, but we have no means of knowing the amount of game they secured, but it is safe to say that altogether they must have secured as much again as the Atkins brothers."

The Los Angeles Times, commenting on this item, says in sober good faith: "It is a wonder that more of the unemployed men do not go into the business of hunting for the market during the season. There is money to be made in this way."

Club Haps and Mishaps.

The Fox River Hunting and Fishing Club, of Oshkosh, Wis., has voted to put up a good club house on its grounds on the Butte des Morts marsh, above Oshkosh.

The club house of the East St. Louis Rod and Gun Club, situated on the famous Okaw River, in Illinois, about forty miles from East St. Louis, has been destroyed by the breaking of a levee, which caused the flooding of 10,000 acres of land and the destruction of much property. The members of this club lost between twenty and thirty boats, and the furniture in the house was ruined.

Game in Old Mexico.

Mr. Howard K. Frost writes from the City of Mexico about a little hunt in that country which some of his friends have just had. Among others I see the name of Mr. Daniel Raum, of Peoria, who is of the law committee of the Illinois State Sportsmen's Association. I could wish Mr. Frost had more details to offer us about the far-off southern country. He says:

"Although my muscollonge tale from northern Wisconsin was doubted, and I have never heard of any one who took time or trouble to consult E. A. Everett, of Hotel Everett, although I gave him as a reference, I still live to tell a tale of a United States shooting party in Mexico.

"A party, consisting of Col. Moore and son, from Kansas City, Mo.; Daniel F. Raum, of Peoria, Ill., and John W. Maxey, of Austin, Tex., under the guidance of E. J. Fletcher, spent last week hunting on a four-million acre hacienda about fifty miles from Tampico.

"Six deer, a quantity of turkeys, and many small pheasants, were secured. As to the quality of the game, consult Samuel E. Magill, our genial Consul at Tampico, who with us banqueted off a fine young buck.

"I stayed behind, not being particularly fond of jungle hunting, though the size of boa constrictors can be attested by Col. Moore and Dan Raum; the number of fleas and ticks is beyond human calculation. The tired and happy hunters say that is nothing compared to the excellence and quantity of the game. Nevertheless all agree that to bag game in Mexico the first shot must be instantly fatal. Like fish, 'heaps got away.'"

Alligator Hunting.

Dick Merrill, of Milwaukee, who spent part of the winter in Florida, tells me he had considerable sport in shooting alligators, of which he and a man who went along, an old gator hunter, killed 14 in all, one measuring 11 ft. in length. Dick brought up a lot of hides and several of the best heads, and will have a collection of valises and gun trunks manufactured from the hides, while the heads will be mounted with such mottoes as "Merry Christmas" and "God Bless our Home." He says it is not very hard to kill a gator, the best point to hit

them being in or near or behind the eye, or behind the forearm. He says that the activity of the alligator in the water was a surprising thing to him. He saw for the first time a new sport, that of calling alligators. The guide would do this by putting a stick below the surface of the water and giving a good imitation of the gator grunt. Soon a streak of bubbles would be seen coming toward the noise, and then they got ready with the rifles.

Legal.

Hunting rights on marshes are affected by the decision in Hall vs. Alford (Michigan), which denies the right of hunters to go in boats and hunt wildfowl on a marsh surrounding an island, in a river, without consent of the owner of the land, where the water is sometimes 10 or 12 in. deep, and at other times the ground is dry and covered with rushes.

A Setting Hen.

CHICAGO, Ill., March 11.—The other day, as I was passing along a street near my office, I saw a dense crowd of human beings, such as make up the average population of a city, all gathered about some object at which they were fighting and struggling to get a good look. The crowd was just in front of a basement grocery store, which was offering cut rates on hams, eggs, butter and other products not indigenous to Chicago. At an earlier time I had observed his joint attracting attention by means of certain living pictures, the same being barnyard fowls roosting on a pole. I more than half suspected some other such *argumentum ad hominem*, and so was not altogether surprised to observe, as I passed, that the center of attraction in this case was nothing more than a large, coarse, yellow hen, of obviously truculent disposition, which was apparently chained to business on a nest full of eggs arranged for her on top of a barrel at the edge of the sidewalk. In plain English, this was nothing but a settin' hen, yet it was something which many persons were apparently willing to hazard their necks to witness. I suppose a great many of these city folk never saw a settin' hen before. They may have dreamed, in a vague sort of a way, that eggs came in some wholesale fashion from the fireside of Mr. Armour, Mr. Swift and other packers who make us our genuine Jersey butter. Perhaps there may have been others in the crowd in whose minds the sight of this busy fowl brought up recollections of pleasant country scenes in earlier days. For my own part, it made me think of blue skies and wide fields, with the caw of crow and the jangle of jay over head, and near at hand the cackle of many fowls—the same of goodly yellow legs and suggestful, portly presence. I admit that I paused to gaze at this yellow hen, proving thus once more the shrewdness of the dealer who posted her there as a sign, knowing that she would be welcomed by humanity, either as a curiosity or as a friend.

There is something in this city scene which jars upon the sense of eternal fitness. All men who savvy hen know very well that the hen prefers to conduct these private domestic matters in a sanctuary of her own choosing. Unless heavily hobbled and side-lined, any hen of spirit which has the intention of increasing the feathered population of the world will forsake the most luxuriously upholstered nest possible to be constructed by the skill of man, and will hunt up some spot of fancied seclusion under a scraggly currant bush at the furthest end of the plaza, and there take her chances with rats, skunks and other elements, merely for the sake of a little privacy. I do not know what there is that passes through the mind of a settin' hen, my native delicacy having prevented me from inquiring too curiously into such matters, even when I was day herd on the hen ranch of my mother. I never have considered that it was for me to inquire why a hen, with the prospect of fourteen cheerful little chirping, soft-bodied, pretty chicklets, should erect the feathers of her head like quills upon the fretful pumpkin vine, or why she should gutturally complain to the circumambient air when approached but by the hand of kindness. This, as I have conceived it, was the business of the hen, and not for me to know. Therefore I must confess that, having these preconceived notions as to the constitutional rights of the hen in such matters, it irked me somewhat to see this hen compelled to carry on her incubation, against her will, in the garish air of the crowded city, pursued not merely by one bare-legged boy anxious to count her eggs and to see whether such eggs would all float or sink in a pan of warm water, but actually surrounded by an assemblage of grown men and adult women, many of whom appeared to possess some of the marks of intelligence and education. Thus, I said to myself, progresses the barbarity of that which we call modern civilization! Nothing is sacred. The reporter with his note book invades the privacy of our divorce arrangements. The grocer sets his hen upon our very streets, concealed by not even the mockery of a currant bush!

There is a moral in nearly everything you run across, if you look at it the right way, sighting along either before it or back of it. We read now of large bags of ducks being killed this spring by those strong-kneed souls who think spring shooting should be allowed, and by those other weak-kneed individuals who think it ought not to be allowed, but who do it nevertheless. Had I been in possession of a gun the other morning, I could very easily have shot this hen, although I presume her embonpoint was not such as it should have been at a later date. I restrained my ardor and did not shoot the hen. Nay, indeed, I recall that in earlier days we never shot the hens when they were ruffling up their feathers and strutting around, evidently with this business of incubation on their minds. We could easily have done so, but we didn't. We figured that each hen thus left to herself would soon produce ten fold for us of fowl which would be better to eat than herself. I am sure I could have killed every hen that my mother owned. I did not do so, and although this was a score of years ago, the last time I was out to the old place there were just as many hens, just as many chickens and just as many eggs as there were when I was a boy. Moreover, I find that the markets of this city have just as much poultry, just as many eggs now as they ever did. While perhaps I should not speak

positively in this matter, I am disposed to believe that this perpetuity of the hen is due to the fact that those controlling the fountains of the hen industry have never made it a practice to go gunning along the currant bushes in the spring in search of easy shooting on nesting birds.

I said there was a moral in almost anything, but a moral is such a bore. Let us not draw any moral. Let us get our guns and kill every breeding bird we can. But twenty years from now let us not wail because the nests along the currant bushes, and along the marshes, are no longer to be found, and because neither on the marshes nor in the markets are wildfowl as plentiful as they are even to-day. Perhaps my hen is still to be found at the old stand. The spring has come. I have not had my gun out for quite a while. Shall I not yield to temptation, and go around and take a pot shot at this fowl which has just come in on the flight, and which is seeking a place where it may privately endeavor to add a few more fowls to the glory of nature and the good of mankind?

Another Singing Mouse.

I have heard of yet another instance of this strange freak of nature. Mr. Stanley Waterloo, of Chicago, author of "The Story of Ab," and one of the best known newspaper men of Chicago, tells me that some years ago, when he had apartments near what is now the Victoria Hotel in this city, he had a singing mouse, which entertained himself and wife for some weeks. He first heard it in one of the closets, singing very shrilly, and explained to his wife what it was. After that they often listened to it for many moments at a time. This, I believe, is the sixth instance of a singing mouse of which I have known.

About Alaska.

Mr. W. A. Work is the last one to write me asking advice about an Alaskan trip. If Mr. Work goes direct to the coast from Texas, he will pass through some point—San Francisco, Tacoma or Seattle—where the outfitting for Alaska has been brought down to a science. Lists of provisions, articles of clothing, tools, supplies, etc., are issued by these firms, and they are fairly correct for the use of a man going to make a long trip in a hard country. He may feel safe in depending on these lists, but I would advise that he add one-third to the grub list, for a man in a cold country eats a powerful lot. It is better to have too much than too little to eat, and if you get tired and come out, you can sell all the grub you have left. As to boats, Mr. Burnham, of the FOREST AND STREAM, took in not one, but two canvas boats. I understand that they did very well. They must be big enough to carry a ton of stuff between the two. It is no pleasure trip that one tackles in the Yukon journey. After he is started he may build rafts or wooden boats, as he finds needful; knock-down or canvas boats are easier taken in now than they were last year, as facilities at the passes are better.

Alaska is a great big country, and some of it is very poor game country, while some is very good. The west coast, say in the Copper River region, seems to have produced the most of the big game we hear about. Suppose one killed any good heads over in the heart of the region along the Yukon? He could hardly get them out without paying far more than they were worth. If he hunted somewhere near the coast, he might save his trophies, even then at great cost and trouble. It is impossible to speak of Alaska as a game country. It is all sorts and any kind of a country, depending on where you go. Of course it is not yet shot out, as are the United States.

As to the gun, tastes differ, of course. The old standby, the .45-70 Government, is always good. The small-bore nitro rifles are fancied by very many. The cold weather will not "kill the powder." The ammunition for the small bores is much lighter, a great point in favor of the latter. The .30-30 and .30-40 have killed some of the large moose and big bears which have this season come down from the Cook's Inlet country of Alaska, so they may be said to have passed the stage of doubt. Many men will not shoot the old rifles at all any more, though the old rifles will kill meat in the proper hands. It is all a question of taste.

Got Him on the List.

CHICAGO, Ill., April 9.—I must add to my lists of persons high in position, but not too high to break the game laws, the name of Deputy Collector M. E. Burns, of Tower, Minn., who has for some time been figuring in a trunk mystery case. Mr. Burns got hold of partridges contrary to the law, locked them up in his little trunk, and then checked the latter as baggage when he went down to St. Paul. The St. Paul Dispatch tells the sequel of what happened to Burns:

Suspicion was directed to a storekeeper at that point and it was noticed that frequent trips were made by Collector Burns to the Twin Cities, accompanied by trunks unusually bulky for traffic in the woods. On his last trip down on March 30, a trunk which went up empty a short time before was brought by him on the stage to Tower, and the weight, and care with which the trunk was kept outside the hotel, probably for cold storage, attracted notice. The trunk was examined at its arrival at St. Paul, and was found to contain partridges. The game was seized and instructions were received by Deputy Game Warden Phillips to arrest Burns on his arrival in Tower from St. Paul. Burns was arrested immediately upon his arrival and bound over to the Grand Jury in the sum of \$1,000. Sufficient bond was furnished and Burns was released. There is widespread indignation here over the brazen attempts which have been made to evade the law, and guilty parties will meet with scant sympathy at the hands of the prosecuting authorities.

Tolleston Again.

There is a rumor out that a receiver has been appointed by the court to take charge of the property of the Tolleston Gun Club for the purpose of satisfying a judgment secured by Theodore Pratt, who was injured by one of the club wardens while trespassing on the club grounds a year ago. Mr. Daniels, President of Tolleston Club, says that he is not fretting any over this receiver, and that the club will not pay any attention to him, but will pursue the even tenor of its way and let the upper courts take their course.

Bags.

Members of the Carthage Lake Club, of Burlington, Ia., have been having fair shooting this spring. Last week

Frank Lundell and Gus Polson bagged 46 birds one day and 23 another. John A. Gregg killed 15 mallards one day. Messrs. Gould, Mohland and Walden have had fair sport during the past ten days.

At Hennepin Club Chan Powers and Dick Merrill were shooting for a couple of weeks last month, and they are reported to have killed large bags of mallards, though I do not have figures at hand.

Shooting in Nebraska, more especially along the Platte, has been good this spring, as earlier reported. Messrs. John M. Fairfield and F. Moore last week killed 225 ducks near Woodlake, Neb., of which 160 were redheads, 24 mallards and the rest mixed ducks. E. HOUGH.

1206 BOYCE BUILDING, Chicago.

Jackson's Hole and the Park.

JACKSON, Wyo., April 4.—*Editor Forest and Stream:* At a meeting held here the following resolutions were adopted unanimously:

Whereas, The Jackson's Hole country is the only territory south of and contiguous to the Yellowstone National Park which is susceptible of settlement and cultivation; and

Whereas, The constant agitation of the question of extending the limits of the National Park by annexing adjoining territory has a tendency to retard the normal development of our community,

Therefore, Be it resolved by the bona fide settlers of Jackson's Hole in mass meeting assembled:

First—As a satisfactory and permanent settlement of all plans for the future enlargement of the National Park by an addition of territory on the south, we do most earnestly recommend the immediate extension of Park control over the territory now embraced in the Teton Timber Reserve, believing that such addition to the National Park will amply suffice for the further and better protection of large game.

Second—While we favor the extension of the National Park to the south line of the Teton Timber Reserve, we are unalterably opposed to any other or further extension of the south boundary of the Park so as to encroach upon or curtail the present limits of the Jackson's Hole settlement. We do not believe that it would be either good policy or economy for the National Government to incur the enormous expense necessary to oust the bona fide settlers of a large and prosperous community, merely to extend the game area of the National Park; and further, we are firmly convinced that the addition of the Teton Timber Reserve will satisfy all reasonable demands for an extension of the National Park toward the south, and at the same time allay all apprehensions of actual and intending settlers in the Jackson's Hole country proper.

S. N. LEEK, Chairman.
FRANK L. PETERSON, Sec'y.

The Boston Sportsmen's Exhibition.

Boston, Mass., March 27.—*Editor Forest and Stream:* What has become of that "Plank?" Has its substance been destroyed? Dry rot has been the death of many would-be great reforms, and caused mainly by the plea that the time was not ready for their presentation, or for aggressive action. I hope the plank has not got "dozy," nor FOREST AND STREAM abandoned its position that no game shall be in possession in close season. When my last week's FOREST AND STREAM came to hand I looked over the views of the Boston Sportsmen's Exhibition with much satisfaction, and confidently expected to see a full-page cut of one particular exhibit of game made by a market man. When I passed by the exhibit in question, which I did several times, the thought would flash through my mind, "This is a sportsman's exhibition! Curious that such prominence should be given to the arch-enemy of the true sportsman." And when I looked at the broken-necked grouse and quail I could not help internally anathematizing a management that would allow such an exhibition to be made. Why didn't they have a corps of grouse snarers and quail netters devote some time to showing how the game is killed by poachers? Would it be out of taste, so long as it was shown how the poacher's middleman handled it?

Here it is nearly April, and yet quail and pinnated grouse are being marketed in quantities in Quincy market and Market street, while cold storage warehouses are filled with meat and birds to be brought out as "first of the season" next fall. No one who knows the method of securing this supply of game needs to glance at the daily press for intelligence of the weather conditions at the game grounds of the country. Deep snows are surely followed by a plethora of venison, grouse and quail in the markets, and their appearance on the street or in the market is an unfailing sign that a blizzard has struck the fields where trapping, snaring and crusting is a profession. If sportsmen are to hold annual exhibitions, let them at least be in a sportsman's line, rather than in the interest of poachers and market men, or anything tending toward it. ELTSAC.

Coursing Partridges.

UNLESS my memory greatly fails me, it was a friend of my youth, Xenophon by name, who in a thrilling narrative called "Anabasis" describes very graphically the way in which certain young bloods of his time were wont to amuse themselves by galloping across country in pursuit of bustards, which, he adds, resemble and fly like partridges. Whether "the pampered favorites of the young monarch" behaved in this erratic manner, "in the spring of the year, B. C.," or after they had retired into winter quarters, as they constantly appear to have been doing, I cannot quite remember; but in either case the sturdy young Greeks must have been uncommonly well mounted if the bustards which they chased so recklessly flew anything like the February partridges of 1898. Possibly, however, it was the baneful examples set by the blades of Xenophon's generation that lately led astray two young men in the Midlands. As they were jogging homeward after a poor day's sport a covey of partridges suddenly rose from a field beside the road and alighted in a meadow a few hundred yards away. Instantly the brilliant idea of chasing the birds across country a la

Xenophon entered their brain, and within a few moments they had flushed the covey again, and were in hot pursuit. The fences were stiff, but the going was fairly good, and for over two miles the erratic youths kept the covey in sight. Then a hidden wire brought the chase to an unpleasantly abrupt conclusion. The disciples of Xenophon are still in bed.—Sporting and Dramatic News.

Sea and River Fishing.

Fishing Up and Down the Potomac.

Harper's Ferry.

THE beautiful! Nature held here her carnival after that day when the mountains were built, and showered upon the spot with lavish hand her gems and robes of beauty. There is no grandeur here, save the mimic grandeur of the pageant, but like the masterpiece of some great scenic artist all beauties are suggested. No cloud-capped towers hem it in; no peaks of snow, no mountain giants, bald and bare, look down upon the twin streams that meet here, to go thereafter, hand in hand, laughing to the sea.

The wedge between the Shenandoah and the Potomac has riven the Blue Ridge to break a passage for the dancing waters, and Maryland Heights on one side and Loudoun on the other are but the ancient gateposts to this ruined stronghold, whose portcullis fell in that long ago—and left it since an unfortunate strategic point, whose possession is a fatality; easy to take and hard to hold.

It was a favorite spot with Thomas Jefferson, who said of it, "One of the most stupendous scenes in nature, and well worth a voyage across the Atlantic to witness."

This only measures the limits of his experience and the exuberance of his enthusiasm.

He had not seen the mile-high cliffs of the Yosemite or the Colorado Cañon. Even the gorgeous gorges of the near-by Great Smokies would have robbed these 1,500ft. hills of any title to "stupendous." A thousand places in Europe, from the fiords of Norway to the Bay of Naples, would as well repay an ocean voyage.

Yet it does not suffer by comparison with any spot on earth, save in the legendary lore which makes so rich every view abroad.

There, behind the coign of vantage of every rock, lurks the memory of some myth, and we are children still, and fairy stories are ever our delight. We laugh at home at the superstition of our neighbors—the easy credulity which swallows tales of Baldur or the Druids; the gods of ancient Rome, or the legends of the Rhine—and in our busy everyday life only hear them mentioned to wonder how one can find the leisure, or having found it so waste it as to pay any attention to this flotsam of history.

Dreams are there uttered as current coin of narrative, until one forgets to doubt, and all the groves are peopled with shades of endless procession—the ideal as substantial as the real, for both are but memories. Down every valley, up every hill, are hordes from the Northern bee hive swarming toward the sunny South, or stern-visaged crusaders like waves pouring to the East, or Moors coming from the south, or Romans conquering as they go to the Ultima Thule in the West. And in every age, on the outskirts of every passing throng, are the motley individuals whose brighter dress, or wit, or chance, has lent them some distinction, or attracted the local kodak fiend, who has preserved for us their "counterfeit in little," or the romancer of that day, or some subsequent, has given to the coinage of his diseased brain a "local habitation and a name," and to-day, as in the long ago, every tree has its Dryad, every stone its spirit. We are matter of fact, and smile at the childish fancy, and yet when we put aside the burdens of the hour and approach their sacred haunts, we search as eagerly as any for the fabled oak, or cave, or stone—the exact spot where Schinderhannes did his deeds of derring-do; the writer weakly treasures a bit of modern stucco from the house where the doughty robber lived—his story seems so unassailable when you have a real piece of mortar to prove it—and another bit from the keystone of the Brig of Ayr, which ought to satisfy any but a misanthrope of the scientific truth that witches cannot cross a running stream.

We stare with awe at the Tarpeian rock, where pitiful wretches were cast down to certain death, and it is not suggested till we leave the hallowed spot that in this country the boys would probably turn somersaults from it. But these fables are the fairies, who borrow from their miraculous grottoes of dazzling splendor the gems and color that tint and brighten the commonplace abroad, and whose lack leaves nature's greatest beauties here almost commonplace. At the best her beauties are with us but compositions of still life—their pictures have all the animation of the biograph.

Harper's Ferry has its memories too, but they are like all of those of the new world, too recent, and lack the glamour of ancient days—Jefferson's Rock—John Brown's Fort, the half dozen times it was taken and retaken during the Civil War. The town is only a thousand feet above the sea, and from the Heights, 500ft. higher, it is so easy to drop shell into it that it cannot withstand an attack. A dozen regiments surrendered in one of the engagements.

We used formerly to lodge on top of the hill with the Mayor of the town, who had a little hotel on the Heights, and at that time the hotel in the lower town was not well kept. But the hill was too far away from the railroad and the river for our comfort; our friend the Mayor died; the lower hotel changed hands, and just now is conducted by a model anglers' Boniface, who makes any arrangements wired for, and feeds us so well that it is one of our favorite trips; the fish, however, continue to grow scarcer. The place is easy of access, and is consequently overfished; and the refuse from the pulp mills accumulates year by year, and the

condition of the water is clearly getting worse, from that and other causes.

One of the easy methods of fishing the Potomac at this point mostly followed by anglers who use bait is to take a boat—and these are kept in the quiet water on the Shenandoah side—and pole up under the bridges to the pools.

As one starts out on this trip for the first time he will be surprised to find the bed of the river covered with shavings, refuse of the pulp mills, and when the harm they do is considered it seems a pity the mills will not destroy their waste. It is a little cheaper for them, perhaps, to dump it in the river, but it is expensive for the public, and there is no doubt the revenue to the Ferry from the visitors would be appreciably increased if they could be encouraged with just a few more bass.

The water in the pools of the Potomac above the bridge is deep, and we have never had any considerable success with a fly by this route.

The easier and pleasanter way is to ride a mile or two to the Island Park, a picnic ground of some seven or eight acres, kept in excellent order by the railroad for summer excursions.

Two or three good wells, one strongly impregnated with sulphur, are on the island; numerous pavilions scattered about, and in one of these we mount our rods, and leave our extra baggage, which is principally lunch, and a spare rod, with the obliging keeper.

A boy for each carries our landing nets and camera or canteen of water—for we do not return till time for noon coffee. There is good fishing all around the island. The stream we cross to reach it, before the moss and weeds fill it in the low water of the late season, is both good wading and good fishing, but the large bass are either taken by resident professionals, or do not care for this part of the stream, as 2lb. fish are rare; but the smaller ones are more plenty than elsewhere in the neighborhood.

The very prettiest fly-fishing, however, is the nearly square mile of tumbled rocks, and pools, and rapids, that have been poured out below the dam in bewildering confusion. When the river is low, nearly every foot of these waters may be fished by the enthusiastic wader, and indeed a good deal of sport may be had dry shod if one is accustomed to clambering over stones.

There are of course no trees, and the fly has plenty of room, but most of the pools are shallow, and as the angler has no cover, and there are no shadows but his own, or the occasional buzzard floating so calmly and mysteriously above, it is hard to keep from frightening most of the fish—as we mostly do. Our rubber sandal waders are not entirely noiseless or jarless; so many of the loose stones are "tippers," and it is always new matter for wonder when one of these, of several tons, lays over with your weight and slides you quietly into the pool—rarely quietly enough to insure your getting any fish in that particular one. And then you are left with so discomforting a sense of the instability of all earthly things; a mishap like this is apt to disturb one's fixed ideas, that is all but one, and that is the total depravity of inanimate objects.

All the beauties of the scenery here are only visible to the man in a wading suit—to stand knee deep in the swift water on a June morning, when the fog has just risen to the tops of the hills about, and all the slopes are green; the steep sides rise so suddenly that it is easy for imagination to carry their peaks beyond the clouds, and it must have been thus that Jefferson saw it when he said "stupendous;" and if there should happen to be a big bass jigging at the other end of your line it becomes a veritable valley of delight.

This is one of the places where the old, old caution, never let the sun get behind you in fly-fishing, if followed by the angler will lose him many a chance. The bare white stones grow very warm in the long summer days, and the only shelter the fish can find is in their shadow. If you fish with the sun in front of you, the fish are too, and can see you approach for a hundred yards; but if you get the sun behind you, especially when approaching some rock or hole where you know a good one bides, it is nearly your one chance of getting him with a long cast, over or around his cover, into the shadow, where he lies blinking the warm hours away to feeding time—that is, if a bass is ever guilty of such stupidity as blinking, for as a rule the proverbial weasel is a Dickens' fat boy to this alert fish.

But the writer caught one asleep once—that is, nearly caught him. It was in the arm of a lake in southern Illinois, almost solid with clean green moss, in which were many crappies and bass. As the boat was slowly paddled down a narrow channel a large, apparently dead, bass of 3lbs. was lying on the top of the moss, with head and tail just submerged, and his bowed back as dry as a powder horn ought to be; the scales do not lose their sheen soon when taken out of the water, but this was a dry, dull gray. We were sure the fish was dead—and had been for days; suddenly it occurred to one of us that a dead fish would float the other side up, and we worked with some difficulty and no care through the moss within reaching distance of the fish, the net was extended, but fearful he was old enough to make the net offensive he was lightly touched on the back with the steel hoop. This electrified him, and he us. He went up in the air and made two or three convulsive springs, that spattered us both, and convinced us he was not quite dead.

Several times that day we saw thoroughbreds making time in other parts of the lake, and were both agreed it was the same fish, which had not yet worked off his surprise. We never recovered from ours—nor has any plausible explanation ever suggested itself why a bass should be sunning himself in this fashion, or permit such an approach.

There are several fish dams about these rocks, now all abandoned but one. The illusion that these take nothing but eels and mullets was rudely dispelled here by finding a 2½lb. bass in one, which the owner of the pot did not find. One of the best fish the writer has taken here was at the V of one of these dams, which had been ruined by a freshet and never repaired, but still stayed a broad pool with its wide arms. We were coming down from the dam for the evening ride home to supper, well earned and already much desired; it was a quarter of a mile from the trysting place, but the day's

sport was counted done, and with this pool covered the boy had been promised his wage was earned. The pool had been whipped to the angle, and the bass probably driven to that point, but not badly frightened; or perhaps he was hiding where the water broke over the stones. At any rate he came up with a mighty lunge and caught himself, for a careless hand did not respond, till he tried to go over the fall with his barbed prize. Then there was resistance that threatened tackle for a few seconds, but he changed his mind and direction, came back into the pool, and finally to net—and then the day was done, and Herbert's lines recalled:

Sweet day, so cool, so calm, so bright,
The bridal of the earth and skie,
Sweet dews shall weep thy fall to-night,
For thou must die.

Our best wish for our best friend would be such another day.
HENRY TALBOT.

Fresh-Water Angling.

No. II.—Brook Trout (Continued).

BY FRED MATHER.

WORM-FISHING for trout in clear water is claimed by some to be an art, but the worm and float in muddy pools is simply trout murder, fit only for those to whom sport is nothing and the number and weight of the catch is the only consideration. I do not look with favor on the worm, save as a lure for the groveling catfish and its neighbors in the ponds, but there are others who use it in what they consider to be a scientific manner, and as I learned and practiced worm-fishing for trout in my early days, and have seen it practiced since, I will write of it, under protest, as it were, for I can say, with the late Dr. Bethune: "My hands have long been washed of the nasty things."

Now a worm is not so dirty if it has been well scoured by keeping it a day or two in damp moss, when it becomes not only cleaner, but also tougher and livelier. The common garden earthworm, of medium size, is best, and is variously known as "our mutual friend," "barn-yard hackle," etc. On a long-shanked hook loop two or three worms, piercing them transversely about three times each, and leave the tail ends free. Use ordinary trout tackle with a 6ft. leader. One hook is plenty; more is murder; a shot, or sinker, only impedes the action of the worm, and should not be used; neither should a float, for the worm should be cast up stream, if the current is slow, and be allowed to roll or drift down, the idea being to present the worm in an attractive manner and to induce a trout that is in hiding to leave its retreat and rush for the bait. After the worm is cast the point of the rod should be lowered for a moment to allow the lure to sink, and then raised in order not to have too much of the bight of the line dragging in the water. Above all, be careful of jarring the banks and alarming the trout, for one so alarmed will not take anything that is offered.

Under the conditions described worm-fishing for trout may be classed as sport, but it should only be practiced in midsummer, and in clear water, to be so classed; and it is so easy for an angler to be tempted to use his worm in other ways and at other times that worm-fishing is not looked upon with favor by anglers generally.

Casting the Fly.

There have been many descriptions of the art of fly-casting, but to be a good caster needs practice. I will try to lay down the main principles, and the pupil must do the rest. Grass will do to begin on if water is not handy, remembering what was said in the chapter on tackle about rods and lines. Leaders and hooks had best be left off until you can get out 30ft. of line, as they will only bother you while learning the spring of the rod. Tie a knot in the end of the line to keep it from fraying out, and lay out 10ft. of line on the grass, or water, the rod pointing downward; lift the line slowly until the tip of the rod is at the height of the eye, then give it a gentle twitch to throw the line over your right shoulder, but stop the rod when just beyond the perpendicular. Use no force. Put a book under your arm and hold it there to teach you to cast entirely with your wrist, and to make the spring of the rod do the work, and not your biceps muscle. Never mind if you have seen champion casters in the tournaments throw up their arms until their elbows were high as their ears; they are working for distance, while you will never be called upon for more than 30ft. in stream fishing, or twice that distance from a boat, on a lake.

Keep the elbow at the side, and when it comes easy to drop the knot on a certain spot at 10 or 15ft., try it at 20. Now you will need to see that your line requires as much time to straighten out behind as it does on the forward cast, or it will crack like a whip and you will lose a fly every time it snaps. You will also need to keep the fly from touching the ground or water behind you, and to this end must make the twitch on the back cast up as well as back, and not let the tip of the rod go too far behind. The way to judge of time is to count from the first forward motion until the knot drops on the water, and then count as many from its leaving the water, and you will have an idea when the fly is straight out behind and is safe to be cast. This is a good rule, no matter how far you may cast.

If in one day's practice you have got out 20ft. of line, delivered straight on the water, and without either snapping, falling in the grass behind you, or coming back in your face, a fault in not retrieving the line high in air, as directed, then go home with the knowledge that you have done well, and think it over.

I have had pupils who took several days to master the art so far, while I have made good casters of others in two days. The main trouble with the slow ones was to rid them of the idea that force is necessary, a thing which they could only realize when their arms were completely tired out. I would have them take hold of my wrist to prove that a light twitch of it made the rod do the work, and then give them the rod and hold their wrists to show the exact moment to give a slight

impulse to the rod, and then when I let go they would use their arms as if throwing a stone at a cow, and muscle was needed to do it. When they once mastered the principle the invariable remark was: "Why, how easy it is!"

It is better when two learn together, and one can coach the other, for the caster should never look to the rear to see where his fly is, and then the coacher can say: "More time on the back cast;" "don't let your rod go so far back," or "keep your fly up higher in the air," as these are the three principal faults of the beginner.

Now comes the time to put on a leader and a tail fly. Then the pupil fully understands that the back cast is the main thing. Snap, crack, goes his whip, and his fly is off and he says that he will allow more time on the next back cast. But he will get into trouble if he essays to cast 60ft. before he can cast 40 well. He is tempted to try it, and his line comes back in his face; he must creep before he can walk. Without a teacher he will do well if he can drop a line straight and true at 40ft. without snapping off his fly in a week's practice.

Let him learn to use both hands, and he will be glad that he can use them when casting for several hours. And after he has mastered all that is here laid down he will find plenty to learn in casting with, against and across the wind, as well as avoiding obstacles in front or behind. A strong wind in front or behind may bring his flies about his head, and while this may often be avoided there is no rule for it, and a gust may serve the best of casters in this manner. In retrieving, incline the rod to the left to avoid fouling the line on the rod, then cast over the right shoulder, making the tip move in a circle.

In works of fiction we read of flies "alighting on the water as lightly as a thistle-down." The inference is that the line did not follow and make its mark on the water, but remained, like Mohammed's coffin, suspended in the air. Many of us can make the flies drop first by casting high and checking the flight, but that is mere trick casting, and the trick is of no use in fishing.

One of the most useful casts was introduced into this country some years ago at the New York State Sportsmen's tournament, held on Coney Island, by an English rod maker, named Harry Prichard. They called it the "hoop-snake cast," "water cast," and it was so successful that those who could not make it barred it from the tournaments. It is a most valuable cast to know where there are obstructions which prevent the angler from extending his line as far behind him as he does in front. He only needs a few feet more than the length of his rod, behind him, for he does not retrieve his line. He makes a short cast, a little more than the length of his rod, leaves the line in the water, and drawing the rod well back behind him, even as low as his shoulder, sends it out with a vim which is not used in the other method, and repeats this until he gets his line out where he wants it.

I have fished with Prichard, and have seen him, when trying for a long cast, have 90ft. of line off his reel in the water while he was whipping at it with no apparent prospect of getting it straightened out, and then have seen it roll out, loop after loop, and drop the fly in the distance. I am not an expert at this style, but can use it in ordinary fishing at 60ft., if on the shore of a lake with a wall of trees behind. It is a most valuable cast to know, but I can't tell how it is done any better than I have in the above description.

Wading Streams.

A stream is waded for two reasons; one is that there are many reaches which cannot be fished from the bank, on account of brush, or because the fly can be cast better in the middle of the stream; and the other is that the trout are not so much alarmed by a wader as by one who jars the often elastic bank in the slightest degree. There are four questions for the wader to decide, and these are:

1. Will you try to keep dry in waders?
2. Would you prefer to wade without rubbers?
3. Will you cast the fly up stream?
4. Do you choose to fish down stream?

I have practiced all these ways, and having arrived at an age when I would never fish if I had to wade all day, perhaps I may be trusted to depict the miseries of each of the two propositions which lead the list.

Waders are made in two forms, if not three. There are wading stockings which come to the hip, and are sustained by a loop which a waist belt runs through. These should be worn inside of heavy hob-nailed shoes, because a smooth, water-worn stone covered with slime invites the angler to sit down if his shoes are smooth, and as he promptly accepts the invitation he realizes that his waterproofs have a hole at the top, and when he crawls ashore he lies on his back and extends his heels up a tree trunk to drain. Then there are wading trousers, which only differ from the above in coming up under the arms, and are supported by suspenders; they require heavy shoes also. Another kind of trousers has the heavy shoes attached, and of three evils you may choose what appears to be the least. If you have worn rubber boots or clothing you will know the evil that I refer to is perspiration, which becomes cold and clammy. A slip on one's back and a change from hot perspiration to cool water is delightful. I'd rather be drowned, like Clarence, in a butt of malmsey, than be stewed in my own juices; it's horrible and enervating.

Then discard all rubber goods, put on heavy hob-nailed shoes, for reasons given; wear heavy woolen stockings, no cotton if you value health and comfort; tie your trousers about your ankles and step into the water. You may, or may not, cut slits in the shoes to let the water out; but it's not necessary to do it, for water in the shoe soon gets warm if the stockings are of wool, and if you are in cold water above the knees a moderately warm foot is a good thing to stand on. On a warm June day, to be in cool spring water from one's knees down and at the same time having the warm atmosphere about one's body and an occasional exposure of the head to the direct rays of the sun is enough to make a man who knows what rheumatism is very careful about enjoying too much of this form of sport; yet there are young men, such as I once was, who do no consider the consequences.

"On with the dance; let joy be unconfined."

That is their motto, and it once was mine; and I have no desire to have young men stop wading streams, as we old fellows did in the auld lang syne, but merely to show them the penalties attached to each form of wading, and to let them choose. If I were called upon to wade a stream to-day, and I have passed the three-score milestone, I would prefer to get into the water with heavy shoes, low cut, and woolen stockings, and take all the chances; but that is only an individual choice, based on the fact that as soon as you step out of the water your feet are in a glow, while with rubbers you are cold and need a foot bath and towel rubbing before you feel right. This seems to be a fair presentation of case of waders vs. non-waders.

Up or Down Stream?

This question has been debated in most of the books on trout fishing since the days of Walton, and writers of the present day do not agree as to the best manner to approach a trout in running water. The difference may be likened unto that of Swift's "big-endians" and "little-endians," as far as the fact that each believes in his own methods; but the anglers have merely argued in a gentlemanly way, while Swift's people actually fought over the question of the proper end of an egg to be broken before it was eaten.

The up-stream fisher works on this theory: The eyes of a trout are placed so as to see well in front, above and on the sides, but not behind; and as he always keeps his head up stream he is not apt to see an angler who approaches quietly from behind. The line is cast above, and comes toward the trout as a worm or fly should, and the fish is not alarmed. The line should be kept from getting too much start by raising the tip of the rod as the lure comes back to the angler. He should then cast again, covering a few feet more of the water before he advances a step, and should try each side of the stream if it is wide. A trout has some slack line, and when the angler strikes there is less danger of pulling the fly from the mouth of the trout; the angler can also better imitate the action of a natural insect, and there is no disturbance of the water above the trout. These are, I believe, the stock arguments of the up-stream fisher. It so happened that I had read all this before I ever did much trout fishing, and I fished up stream in Canada, the tributaries of the Genesee River in western New York, and on other streams, and found so many objections to it that I tried fishing down stream and paraphrased an old couplet in his manner:

"This way to fish I long have sought
And mourned because I found it not."

In fishing up stream the only advantage that I can see is that you are behind the fish and it does not see well in that direction; but as you cast above it the glint, or shadow, of the rod may not be confounded by the trout with the waving of branches, especially when the branches are not waving. Then your line comes back on you and you must keep up a vigorous, arm-tiring casting, often where trees, bushes and other obstructions take the fly when you are not casting for them, but only for trout. Think of an angler striking with a slack line and "pulling the fly from the mouth of a trout!" My dear boy, when a trout rises to an artificial fly, thinking it a succulent and palatable insect, and finds that it is only a dry combination of steel, silk, shoemakers' wax, fur, feather or other unpalatable material, it drops that counterfeit like a hot potato if it can. There is no slow process of deglutition such as a catfish gives a worm, but the fraud is rejected at once, if accident has not fixed the hook in the jaw, as it does nine times out of ten, if the line is nearly taut. On a slack line a trout may do the ejecting act oftener than on one which has no slack. Its rush, snatch and retreat to cover are quicker than the strike of the angler, and the fish is often hooked by its own exertion.

In fishing down stream the water may be disturbed and the trout frightened by a rolling stone or by sediment which is loosened, and that is the only objection which I can see; but then one has complete control of his line and fly, can work it across the stream, on the shallows or into pools, and by skillful handling cause the fly to struggle like a drowning insect, because you need not cast at all, the current doing the work, no flies are hung up in the bushes, and the angler need only be careful about disturbing the water and watching for a rise. And then this fact remains: The swift brooks cannot be fished up stream because in them the angler cannot control his fly, and it is back at his feet in a short time.

I prefer to fish brooks down stream from the banks, as much as possible, getting into the water only when necessary to avoid bushes or to cross to the opposite bank, and to wear low shoes and heavy woolen stockings. By this mode one is not in the water long enough to become chilled, and can fish with more comfort than in any other way.

In England they use the fly in two ways, known as "wet fly" and "dry fly." In America, as far as I know, dry fly-fishing is not practiced; it is a modern use of the fly which is said to be killing where the trout are wary and discriminating. I only know of this method by reading of it, and not having a description of the mode handy, will give my idea of the process. The fly is a winged one, with the wings cocked up, and it is not allowed to sink, the object being to simulate a living fly which has just alighted on the water. Therefore it must be kept dry, and after a cast the angler waves the fly back and forth in the air for a longer or shorter time, until he thinks that the fly is dry, when he makes another cast. Some British angler, with a desire to save both time and muscle, has coated his flies with paraffine. If I were a dry fly-fisher I would have a tablet to that man's memory erected inside of my brain-pan, and would bless him every time I went forth to cast the dry fly, provided that the device works as well on the water as it does on paper.

Somehow the dry fly has not tempted me to try it. It looks like hard work to little purpose, and where I fish there seems to be no necessity for it. I took six good trout last week, on Long Island, in the old-fashioned

way, and the six weighed nearly 2 lbs., large enough for trout and plenty for me.

In casting the wet fly, I would have left off the adjective if I had not been writing of the dry fly; after the fly strikes the water it should be allowed to sink a few inches, and then the top of the rod, which should be from 2 to 3 ft. above the water, is slightly twitched upward a few inches; a pause and another twitch; this is repeated so as to give the fly a darting motion, several times, until the rod is so well up that another twitch cannot be made without getting its tip so high that the line cannot be retrieved. This will depend somewhat on the length of line that is out, but mainly on the judgment of the angler, who must ascertain for himself just how far he may work his fly and yet retain control of his rod so that he may retrieve his line for another cast. If he overdoes the working of the fly, and cannot retrieve his line, he must reel up until he can, and then start anew, making short casts and unreeling line with his left hand as he lengthens them.

The wet, sunken fly, with wings soaked and sodden, is not a bit like the artistic bit of millinery which you took from your fly-book, but when again dry it will look nearly the same unless you have bought flies that are half dyed at some department store. Take the red ibis, or as it is often called, scarlet ibis; the feathers of the bird are more expensive than those of a white pullet which are dyed, that is certain; but if the dye is good the feather is as good, and there's the rub. If, after a day's fishing, your scarlet ibis has faded to a watery pink you may be justified in saying what you think, for barring accidents I calculate the life of a good, well-tied fly at twenty trout. After that it becomes frizzled, frazzled and bedraggled, even if it has not partly broken away from the gut at the point of attachment. That is the weak point in all flies, but weakest in the cheapest. I will not have double gut on a hook except perhaps an inch at the attachment, and as a writer may be expected to give reasons for his opinions, this is the reason: A double snell of 6 in. long will catch a bit of weed, as it is not twisted, and no fish will rise to a fly that has weed attached to it. Then if one strand breaks the other follows. This wearing of the gut at the top of the shank of the hook is a serious evil; not serious to the fly makers, but to the angler's pocket.

On the other side of the water they have been using eyed hooks, both turned up and turned down, for flies; and while I have not seen them they seem to be a good thing. Then one merely hitches on a snell with a "fisherman's bend," and if the gut is frayed after use it can be shortened or thrown away. It is possible that such flies may be found in the tackle shops, but I have not looked over flies in the shops in some years, because I have a large stock on hand and take care of it. I have picked up half a dozen of this or that fly here or there when they looked inviting, and that is how a stock accumulates.

The care of flies has been a subject of discussion in angling papers for many years. The main troubles are the moth and brittle gut. Many an angler has opened his fly-book in the spring of the year and found a few good flies and a lot of refuse and empty moth cocoons, as well as brittle gut on his flies. Much has been said of camphor, cedar boxes and other moth repellers; but some dozen or more years ago I reasoned this way: The moth eats many furs, but never the dyed ones, like sealskin and others. The flies which it leaves untouched are those with dyed feathers or dyed wool. The female moth likes to lay her eggs in dark places, where there is little disturbance, and my fly-book, after September, is just the place. They must be hermetically sealed, but how? Thoughts of tin boxes, soldered tightly; were floating around, when a soft voice said: "Won't you come into the dining room and open this jar of fruit? My hands are not strong enough." After the cap of the Mason jar was started the fly-preserving problem was solved. No moth could get in there, and if the jar was perfectly dry the gut would not get brittle. A dozen years of canning flies and fly-books has proved the utility of this plan, which I do not remember to have seen published. There is no patent on it, but it has worked so well with me that I wonder that the rubber ring of the Mason fruit jar never commended itself to anglers to preserve their flies as well as their fruits.

When I started this series it seemed as if one kind of fishing might be done up in a chapter, but as I read over what I have written it seems as if there was enough of detail left out to make a volume, and I have not touched upon the fishing for trout in lakes, from either boat or shore, and must let that run over until next week, or the editor might rip the scissors through a paragraph where he thought it best to stop.

Variations in Fish Supply.

CHICOPEE FALLS, MASS.—*Editor Forest and Stream:* I wish to make an inquiry, and ask if some readers of FOREST AND STREAM can explain the following: In Plymouth, Vt., are ponds of from, say, one-half to three-quarters of a mile long and one-third to one-half of a mile wide, fed by good mountain spring streams. Fifty or sixty years ago they had plenty of speckled trout in them, also bullheads, or hornpouts, and eels. The trout and bullheads all disappeared. Next came pike and grass pickerel. Some ten or fifteen years ago black bass were put in by the Fish Commissioners, and perhaps yellow perch; at least they are in there, and perch in particular are plenty. There are also wall-eyed pike, put in also by the Fish Commissioners, I presume. Thirty or forty years ago it was no trouble to go up there and get a good string of pike; but of late years very few are caught. The same may also be said of black bass and wall-eyed pike. I have, and many others have, quite a curiosity to know the cause of all of this change. Of course the pike after being put in soon cleaned out the trout; but what is depleting the ponds of all the other kinds of fish, except yellow perch and black bass? Some say they are fished to death; such is not the case, considering the area to be fished over; and then again, those that do fish do not get much but perch, occasionally a wall-eyed pike, a black bass, and once in a while a pike.

AN INQUIRER.

ANGLING NOTES.

Love of Fishing.

Nearly every one who fishes has at some time or another expressed his interest in or love of the sport; at least I imagine so, for I have heard many fishermen declare how fond they were of angling, and this love of fishing is usually measured by something to indicate the degree of intensity; as, for instance, when a man says he would rather fish than eat, which is usually a figure of speech rather than a fact when it comes to a test after omitting a single meal. Never have I heard any one declare that he loved fishing better than his life, but a certain playwright must be, as I thought up to a certain point, an enthusiastic angler, and perhaps he would go without two meals for the sake of fishing, if we can judge of his fondness in this field by what he causes two characters to do and say in one of his plays. The scene is in the cabaret of the "Silver Trout" in France during the time of the French-German war. On the wall in a case hangs a mounted trout of 12 lbs. weight, and two old fishermen are discussing the fishing of other days, and the capture of the particular fish on the wall. The German army is in possession of the town, and orders have been issued that no fishing will be permitted in the river which runs through the town, under penalty of death. The two old men become enthusiastic over the thought of the sport they have had, and the longing to cast their flies on the river (for they are fly-fishers) outruns their discretion. They understand fully that if they are discovered they will be shot, and in explicit language one asks the other if he is willing to risk his life for one night's fishing under a full moon; and the answer after due deliberation, as becomes a patient fisherman, is yes. They depart from the cabaret to engage in an evening's fishing, while the German soldiers are enjoying a night of festivity at the conveniently situated castle. The fishermen are captured and brought before the commanding officer of the invading army, and the fly-book of one of the men contains memoranda of pools, fords, rapids and shallows which prove to be of use to the invaders. The string of trout captured with the men bear mute testimony to their occupation and their devotion to it, but having met the lord of the castle during their fishing, a personage whom the Germans are particularly anxious to lay hands on, they decline to answer any question which relates to the meeting, and are led out and shot in one, two, three order.

What seems strange to me is that a playwright who makes his characters talk intelligently about fish and fishing, even to the correct Latin name of the fish, and who introduces a scene such as that at the "Silver Trout," does not devise a way to enable the devoted fishermen to escape the extreme penalty for having indulged in their favorite sport. The lord of the castle is lugged in by the heels anyway, and if the meeting had been omitted no one would have missed it or known anything about it from the front, and it would have been such a gracious act on the part of the officers of the army of occupation to have excused two old men superlatively devoted to fishing for having allowed their desires to run away with their judgment. I came away from the play, well acted and well mounted as it was, simply disgusted because those two kindly old fishermen were sacrificed when a few strokes of a pen and a very little ink would have saved them; and I finally changed my opinion and came to the conclusion that the author was not a simple pure angler, but perhaps just a pot fisherman. I do not wish to be too severe in my criticism, but really the act of the two old fishermen in giving up their lives for a few small trout is as near real life as some other portions of the play; but I would not have kicked at a brutal ruffian, disguised as an army officer, becoming a tearful saint in three hours' time, nor at the strange vagaries of a woman during the same period, if the author had not deliberately, and with malice aforethought, killed the simple old fishermen.

A little further down Broadway, at another playhouse, there is a play on the boards, and here too there is a fishing incident in one of the scenes. A bright-eyed, bare-legged urchin, cheerfully soiled and rumped, appears with crude fishing tackle, gentles in a bottle and ground bait in a box, evidently, for the scene is laid in England on one summer's day, and fishes in the water on the drop at the back of the stage. An unsavory gipsy, who looks as though he would cut a throat for a sixpence, gives the boy some advice about the fishing, and charges him finally to put back all fish under 1 lb. weight. This may be considered a bit of pleasantry on the part of the ill-favored gipsy, but I choose to look upon it as sage and timely advice, and it then and there occurred to me that the stage might be made the vehicle for educating our fishermen to return small, undersized fish, and to discourage the record breaker and fish hog.

If any one will write a play on these lines, I would be glad to submit for his approval one scene showing the end of the man who kills fish to make a record or to have them photographed when there is no possible chance to utilize them, and promise that the scene depicted will be hot.

Fish Planting under Difficulties.

To one who plants fish to improve the fishing, to stock or restock overfished waters, the selfish attempts of others to thwart all good designs in this direction causes a feeling to arise which cannot be expressed in print. The utter selfishness of some men is beyond comprehension, and no punishment short of instant and violent death seems adequate to fit the crime. Here is an example: I planted some choice fish in a certain lake, and a bill was introduced and passed in the Legislature to close the streams tributary to the lake where the young fish were planted for a term of years, to enable the fish to get a start and protect them when they ran up the stream to spawn. For these purposes the stream was closed to all and every kind of fishing. The young fish, and they were landlocked salmon, did well in this stream, and finally ran down into the lake, where they continued to grow, and everything gave promise

of establishing the fish in the lake to furnish the best of fishing. When I expected the fish would run up the stream to spawn I told a game protector that the fish would be due in the stream about such a time, and I wished him to watch for them to see if they actually put in an appearance.

It must be understood that at that time I had no idea that the fish would be molested on their spawning beds, for the sentiment of the community was in favor of game and fish protection, and the lawless of the region in several instances have had a taste of the law for illegal fishing. The game protector was not to watch the stream, for when every one was apparently interested in establishing the fish it was not considered necessary; but the protector was selected because he was a safe man for the work, and would report to me exactly what he found. He did find that the salmon ran up the stream and prepared spawning beds, and at one place he counted about twenty fish, and he made occasional visits to this particular part of the stream without his visits being known.

One day he reported to me that the salmon were gone, and there was evidence on the bank in the form of tracks that made him believe that the fish had been speared. The fish were not again seen where they had made their spawning beds, and from what I can learn I fear the worst—that is, they had not spawned before they disappeared. If there is anything more contemptible than taking fish at such a time, I do not wish to know of it, and it is most discouraging to attempt to stock waters with choice fish under such circumstances. But this is but one of the many obstacles that are encountered when one tries to improve the fishing by planting with fish the waters that are fished out. People wonder why the fishing does not improve in some streams that are perhaps planted annually with fry or older fish, but the people who do the wondering are law-abiding and do not realize the constant war that is waged against the fish by all sorts of engines, from early spring as soon as the ice is out until after the spawning season in the autumn. The methods of the fish thief are secretive in the extreme, and it is only one out of many that is apprehended and punished for illegal fishing as to season or methods. Too often the sentiment of the community where the illegal methods are practiced is in a great measure responsible for them; not that the illegal fishing or the illegal engines are approved of, but because they are not disapproved of in a forcible manner. The people are simply passive in the matter, and the destruction goes on unchecked. Nothing in this world so discourages illegal fishing or illegal engines as a conviction in the courts and the imposition of a fine. This not only checks the actions in this line of the party of the first part, but it discourages his associates of same kidney.

A. N. CHENEY.

My Reputation for Veracity.

From the North Carolina Presbyterian.

LET me explain that I am a minister of the Gospel, and at the same time something of a sportsman. When my physician prescribed a rod and gun for my dyspepsia, I determined at once to take his prescription. I did not see anything inconsistent in the character of a minister and a sportsman. I could not see how fishing and hunting could hurt either my reputation or my usefulness. But sad experience has convinced me that it is very difficult for a fisherman to keep his reputation for veracity, even though he be a preacher.

I solemnly assert that I never told a lie in my life about any of my fishing or hunting experiences. I have been scrupulously exact in my adherence to truth. And yet I have lost my reputation for veracity. I want to tell you how, as a warning to all fishermen, and especially to my brethren who think of going a-fishing. One of my professors of theology used to say to his class in the seminary: "My young brethren, if you wish to maintain your reputation for veracity, you must not always tell the truth, but always tell a probable truth." He spoke from experience. It is to the neglect of this wholesome advice that I owe the first step of my downfall. Being debarred by my profession from the sportsman's privilege of drawing on his imagination, now and then, I have yielded to the temptation to tell some extraordinary truths. When the circle is gathered round the camp-fire at night, even a preacher does not like to be outdone. As he cannot invent, he must run the risk of telling some improbable truths. I thought my reputation would stand the strain. So it did, for awhile. But I had too many improbable experiences.

For example. I was fishing one hot day in July in a lake. My companions had gone off with the boat, and had left me on a log near the outlet of the lake, which was choked with drift. My minnows were all gone, and I had no flies. I put a spoon troll on my line, leaving the float on. Then I let the current carry it down to the drift and drew it along a log. At about the third cast it caught on something. At first I thought it was a snag. But presently the snag woke up, and then for about fifteen minutes I had the liveliest tussle I ever had in my life with some unseen monster. At last I landed him, and it proved to be a big black buffalo,* weighing nine and a half pounds. Now this is an improbable story, because it is a well-known fact that a buffalo never strikes at a troll. When I told the story in town it was received with an incredulous guffaw. One good old doctor, himself a sportsman, when he heard it, said, "Well, that just shows that even a preacher can't help telling a lie about his fish." I appealed to my companions who had seen the fish; but unfortunately they had not seen me catch it; besides for some reason their testimony was supposed to weaken my case. And, to crown all, one of them went down there about a week afterward and reported that he had caught another buffalo on a troll in the same place. That was too much. Let me explain that I had hooked my fish in the gill. He was in the way, and the troll had caught him by accident.

When once my downfall had begun it was assisted by others. I had a friend, a lawyer, a sportsman, and with some talents for fiction. He used to say that the only

* To preserve some shreds of our correspondent's reputation, we explain that "buffalo" is not the wild animal of the Western plains, but a species of fish.—Ed.

thing in the way of my becoming a true sportsman was my high moral character. So he set about removing that hindrance. He did it in this way: He repeated my stories with embellishments of his own, and credited the whole to me. For example: Tom Crow and I were fishing in Ink Bayou one day for pike. I had a float on my line to prevent being snagged on the bottom. We were standing on a log in the center of the stream. I made an unsuccessful cast and was just drawing back when a big pike leaped out of the water at my float, and cut my line off above the float as clean as if it had been done with a pair of scissors. "Tom," said I, "did you see that?" "Yes." "Well, don't you tell anybody, for if you do I shall have to corroborate it, and it will be as much as my reputation is worth." But he could not resist the temptation. He told the lawyer, and he reported that I had said that that pike had jumped out of the water and bit the end of my steel rod off.

At another time I was fishing on the upper White River. Standing on a log about 10ft. above the water I made a cast at a shady pool under a big cottonwood tree. The minnow fell on a root of the tree just at the edge of the pool. A 3lb. bass leaped at it and took it off that root. I told it in camp that night. When I got back to town I heard it reported that I had said that a bass had jumped up on a log ten feet out of the water and taken my hook. Could any man's reputation stand such a strain as that?

But it was a brother preacher who gave the final blow to my reputation and disgraced me publicly. He lived then in Kentucky, the land of Joe Mulhatton. I will call him the Rev. Mr. Buck. I do not give his real name, because he, like myself, has removed to a new field of labor, and I do not wish to do anything to hinder him in retrieving his lost reputation. His name is not Buck, but it is synonymous with Buck. He is a worthy son of Kentucky. (I mean no reflection on Kentucky, for I myself am a Kentuckian.) He has very decided talents as a novelist. We were talking of cold weather one day in camp and he remarked he had seen the thermometer 36 degrees below zero for six weeks in Kentucky. At another time he stated that he had seen a beech tree in Kentucky which had Daniel Boone's name cut on the heart of it. Boone had cut it on the bark when it was a young tree, and the tree had grown up around it. I was told that he used the same story in a sermon as an illustration of how outward influences affect the inner character, only I believe it was a watermelon that time instead of a beech tree. Well, brother Buck visited me one summer in Arkansas. He preached a good sermon for me one Sunday, the subject of which was, I believe, Lot's reputation for veracity. On Monday, Dr. G., a crony of mine, and I took him fishing. On the way home, we passed a celebrated shooting point, where the ducks crossed at dusk from their feeding ground to their roost. "Buck," said the Doctor, "do you see those two trees there? Well, I suppose there have been a million shots fired at ducks between those two trees." "Doctor, that's bigger than any of my yarns." "Well, Buck," said I, "they have been shooting there for fifty years, and a great many shots have been fired."

That was all that passed. Buck went home. Meanwhile I heard it reported on good authority that he told somebody in Kentucky he had ridden 150 miles with me on a bicycle while in Arkansas in one day. I had never been out with him at all on a bicycle. The next year he was invited to deliver the address before the alumni at the commencement of a certain college in Tennessee. As an alumnus of the institution and a member of the Board of Directors, I was to sit on the platform with him and open the meeting. As we were going up the steps, I said, "Buck, what about that bicycle yarn of yours, that you rode 150 miles in one day with me?" He got out of it by saying that it had happened in Texas with a man whose name was similar to mine. But he stuck to the 150 miles in one day. He announced as the subject of his address, "Exaggeration." I was struck with the subject, as I thought it one which he was remarkably competent to treat. I expected him to give some examples, but I had no idea of what was coming. "Ladies and gentlemen," he said, "you have no idea how common exaggeration is. It is a habit into which even good men may fall, especially if they are sportsmen. Now, here is my friend from Arkansas. I believe he is a good man, and, ordinarily, a truthful man. But when I was with him in Arkansas last summer, he pointed out two trees to me and said, 'Buck, do you see those two trees?' Well, I suppose I have killed a million ducks between those two trees." It brought down the house. It leaked out in Arkansas. My lawyer friend eagerly seized upon it, and helped to circulate the story. When I left my charge, he wanted my church to call Mr. Buck on the strength of that story. But it gave the final blow to my reputation. This is the simple truthful story of how I lost my reputation for veracity. Now, brethren of the clergy and of the rod, hear the conclusion of my sermon. If you want to keep your reputation for veracity, you must not only always tell the truth, but a probable truth. And the second rule is, keep out of bad company. Lawyers, doctors, and even some preachers are not always safe company for a truthful man. But a much safer rule than either of these is this, Don't go fishing.

NIMROD WALTON.

LITTLE ROCK, Ark., April 4, 1898.—*Editor Forest and Stream:* The above relation was written evidently by our lamented sportsman parson and published in the North Carolina Presbyterian, and which seems to me too good to be sandwiched between articles on predestination and editorials on the beauties of eternal damnation.

Without being unpardonably conceited, I think I may claim to be the "friend, a lawyer, a sportsman with some talent for fiction," therein referred to.

There are others in my profession. I only say that I consider it unprofessional to lie unless I am paid for it, and that I am not much of a fish liar on general principles. But I do deny that I ruined the Parson's character, and submit that his own statement of his fish stories would ruin the character of Moses, St. Jerome or St. Paul, to say nothing of Calvin and the latter-day saints.

But the Parson did not tell all that ruined his character. My mother and Mrs. Green are next-door neighbors and pillars of his sanctuary. The mater had been away all summer, and upon her return Mrs. Green came

over, and they got to discussing church matters. Says the mater to Mr. Walton (which is not his name, but I do not desire to spoil his usefulness), "Did the Parson preach for you all summer?" Says Mrs. Green, "Yes; all except one Sunday, when he went fishing."

I was not with the Parson that particular Sunday, and I cannot say whether he went fishing that day or not. But I have known Mrs. Green for thirty years, and I am satisfied she never told a lie in her life. I am not so sure about the Parson. Again, we were building a club house at Grassy Lake, and the President, Secretary and Parson went up to see how matters progressed. It was hot, the house was not done and they had to put up with the best accommodations Mr. Retz, the German contractor, could furnish them. The mosquitoes were large, healthy and voracious. While the Parson doped himself with kerosene Retz turned the air a pale azure that left a smell of sulphur in the vicinity. At daybreak the President and Parson went squirrel hunting, while the Secretary stayed to help Retz get breakfast. While cooking it he said, "Retz, you ought not to swear that way, for one of those men is a preacher, and he does not like it." Retz: "Which is a breacher?" Secretary. "The little one with the light mustache." Retz: "Get out mit you; didn't I hear him say last night, 'Dash blank these mosquitoes to blank!'"

The Secretary, the same doctor that told about the million shots at ducks, is responsible for that story. I was not there, and personally I never heard the Parson wish an objectionable individual further away than Little Rock, which he may have considered synonymous.

I could add other instances, but space forbids. So he went downwards and his character got worse and worse, till even the ewe lambs of his flock, who generally worship their pastor, began to damn him with faint praise, such as:

"Brother Walton is a good man, but he does tell awful fish stories," or "Brother Walton is a good man, but he does go with an awful tough crowd."

And finally the climax was reached when on the strength of that buffalo story he was publicly installed as Champion Liar of the Arkansas Association of Fish and Game Liars, and I had the honor to present the elegant medal, with appropriate resolutions and remarks. And the Parson responded with another lot of stories that debared any other from ever claiming it.

And so, his usefulness being utterly destroyed by his own fish stories, he left us, regretted by none so much as by the publicans and sinners, with whom, like his illustrious Master, he most associated. J. M. ROSE.

New England Fishing.

Boston, April 9.—Early trout fishing has received a decided setback by the cold weather. Every night since the season opened the mercury hereabouts has been below freezing, and in every pond and stream in Massachusetts ice has formed since the second day of the month. Besides nearly 4in. of snow has fallen, melted, and swollen the streams with snow and ice water. For such reasons the early trout fishermen have generally stayed at home, some of them visiting the tackle shops daily to talk the matter over and "swap yarns" with each other concerning what they did last year, and what they will do as soon as pleasant weather comes. On the opening day a party of Boston sportsmen visited the Chamberlayne Brook, or privilege controlled by that gentleman, and in a couple of days' fishing are reported to have taken sixty trout. This brook was leased last year by E. H. Wakefield, Jr., a well-known lover of the rod and reel, and visited by himself and friends several times, with more or less of success. The brook is in the neighborhood of Bourne, on the Cape. Mr. Chamberlayne leases it every year, but generally reserves the right to take a party of friends there at the opening of the season. Leominster fishermen are reported to have brought in some good catches the opening day, from State and Barker brooks in and near that town, but the cold weather has since stopped about all fishing.

Some of the best known fishermen are looking for the ice to leave Sebago Lake and Lake Auburn, Me., and Newfound Lake and Dan Hole Pond, N. H. Their landlocked salmon tackle is all ready, but the cold weather has actually put the ice at worse than a standstill, for it has been freezing nearly every night, and may not go out for a week, though all ready to go a week ago. On the 16th R. O. Harding will have in charge the following party of anglers, for Newfound Lake: Edward Brooks, E. H. Wakefield, Jr., George D. Pushee and J. Otis Wardwell and son. At the lake they will be joined by the New Hampshire Fish Commissioners, Messrs. Nathaniel Wentworth and F. L. Hughes. The party will stop over the 19th, which is a legal holiday in this State. If several fine salmon are not brought out it will not be because they are not lured by both patient and expert anglers.

The Sportsmen's Show has resulted in many little episodes of good feeling between guides and visitors, especially sportsmen, and is likely to result in many more. Mr. Frank F. Dodge met a former guide there, A. B. Douglass, of Kibby Valley, Me., fame. Mr. Dodge took Mr. Douglass to the rooms of the Boston Athletic Club, where the latter was greatly interested. The other day Mr. Dodge received a letter from Mr. Douglass stating that he had sent the club "a specimen," a bear. At the time of this writing Mr. Dodge is much interested as to whether the bear is a live one or a harmless piece of work from the shop of some taxidermist. The letter does not state, but in either case the "specimen" will be well taken care of when it arrives.

Boston, April 11.—The weather has changed for the better, and sportsmen with rod and reel are improving it. Two or three parties left Boston for the Cape Saturday. They go to controlled brooks and privileges mostly, and have but little to say as to the exact location. Two parties went to a brook on the line of the New York, New Haven and Hartford Railroad, near Moulton Station, Conn., on the same day. This brook, controlled by Boston sportsmen, is said to be a natural trout stream. Considerable restocking has been done, and trout 8in. in length have been grown in one year. The proprietors of the brook have about 12,000 trout in their troughs, of different sizes. There are two ponds in con-

nection with the brook, into which the trout are turned as they grow larger. The owners will be there often this summer.

Sebago Lake, in Maine, is about clear of ice, and will doubtless be entirely clear by the time this catches the eye of the reader. Landlocked salmon fishing has started in good earnest. Two Auburn, Me., fishermen are reported to have taken thirteen salmon from Sebago up to Saturday night, the largest weighing 11½lbs. and the next largest 9¼lbs. A number of Portland, Me., fishermen are also at the lake, and having fair success. Lake Auburn, Me., is not yet clear of ice. It usually clears a few days later than Sebago. The local salmon fishermen are waiting patiently. Late reports from the Rangeley trout waters suggest an early clearing of the ice, but after all much will depend upon the weather.

Boston, April 11.—A special to the Herald this morning says that the ice is out of Sebago Lake, Me., and fishing is good. Four Bostonians have been at the lake five days, and have caught 140lbs. of salmon. They left for home Sunday evening with fourteen large fish. At Kettle Cove, on the east side, and at the outlet of Crooked and Muddy rivers the fishing is excellent. A party of Portland fishermen spent Sunday at the lake with good catches, caught Saturday night (?) before 12 o'clock. The steamers of the Sebago Lake and Songo River Steamboat Co. are to be run in close connection with trains from Portland. SPECIAL.

CHICAGO AND THE WEST.

Rod and Reel.

CHICAGO, Ill., April 7.—The Milwaukee Rod and Reel Club have elected the following permanent officers: President, John P. Murphy; Vice-President, Francis Bloodgood, Jr.; Secretary and Treasurer, Henry C. Reed; Directors, Benjamin M. Weil, William E. Furlong, John good, Jr.; Secretary and Treasurer, Henry C. Reed; Di- The club will possibly hold a casting tournament this summer, and it is expected that it will send a good delegation to the fly-casting tournament at Grand Rapids, Mich., next June. The Milwaukee men are giving the new club a very good membership.

Effective.

Last winter FOREST AND STREAM printed in these columns the story of the long-continued violations of the fish and game laws along the Rock River, of Illinois. Then came the story of the organization of the strong protective body at Rockford, with its large membership and its definite purpose of stopping the illegal work along this stream. To-day, less than two months after this body was first organized, comes the news that the illegal seining and spearing has been practically stopped already, so vigorous has been the campaign of reform. This shows a fact often overlooked by sportsmen. It is easy to do a thing if you go and do it, and don't sit down and talk about it, and expect it to do itself.

Cleaning the Calumet.

Deputy Earle, of Indiana, has been working for a while along the Little Calumet River, just across the State line, and has now about cleaned out the nets on that stream and the Deep River. He has taken out 1,000ft. of seines and about 100 other nets. The extent of the petty fisheries here may be seen when it is known that about three tons of fish are shipped weekly from the markets of Hammond and Hobart, Ind. These streams were once very good angling waters. Most of the fish shipped now are carp.

The Season.

CHICAGO, Ill., April 9.—Everything points to an early fishing season this year. Friday of next week will open the trout season in Wisconsin, and there will be a goodly number of Chicago anglers who will eagerly hurry up to take part in the inaugural proceedings. Very rightly, we are not allowed to take bass in Wisconsin until May 25, nor indeed should they be taken in Illinois or Indiana until after the spawning season. It is likely, however, that this season will be earlier than common this year, and I have no doubt that within the next thirty days we shall hear of bass fishing in the Kankakee, the Fox and other well-known streams in this vicinity.

Trout Streams of Michigan.

The southern peninsula of Michigan is a wonderful fishing country, though not so well known to sportsmen of Chicago as Wisconsin. This week the G. R. & I. Railway, which crosses many good streams in that favored land, issues its season guide book and publishes a list of angling waters. I consider these railroad lists as being on the whole of value. They are compiled partly from reports of local agents, who are not always anglers, and who are not always fully posted. The evidence is therefore hearsay evidence, but indeed so is any evidence in regard to angling localities. I hope readers of FOREST AND STREAM will report any localities in the following list which they have found to be especially good. Railroads are corporations, and therefore soulless, but when they tell us where to go fishing they are doing a soulful thing. In the list the figures given show how many miles distant the waters are from the station named.

Belmont—Whitney Creek; Rum Creek, 5; McFarland Creek, 4; Smith Creek, 1½; Mill Creek, 5; Bear Creek, 5; Lamberton Creek, 6. Speckled trout.
Rockford—Barclay Creek, Rum Creek, Shaw Creek, 1½; Stegman Creek, 1½; Little Cedar Creek, 5; Gray Creek, 5; Spring Creek, 6; Hutchings Creek, 2½. Speckled trout.
Cedar Springs—Cedar Creek, Little Cedar Creek, 1½; White Creek, 4; Porter Hollow Creek, 5. Speckled trout.
Sand Lake—Duke Creek, McFalls Creek, 4; Frey's Creek, 7; Cedar Creek, 2½; Duck Creek, 5; Spring Creek, 1½; Simpson's Creek, 3; Grant Creek, 2½; Crandall's Creek, 3; Greer's Creek, 3; Simmon's Creek, 6. Speckled trout.
Howard City—Little River, 5; Handy Creek, 3; Church Creek, 2; Indian Creek, Bruce Creek, 3½; Tamarack Creek, Rice Creek, 1. Speckled trout.
Morley—Big Creek, 2; Rosey Run Creek, 5; Quigley Creek, 3½; Little Muskegon River. Speckled trout, bass and pickerel.
Stanwood—Mack's Creek, Cedar Creek, 6; Bett's Creek, 8; Big Gulch Creek, 5; Linwood Creek, 2½. Speckled trout.
Big Rapids—Ryan Creek, 1½; Water Tank Creek, 2; Byers' Creek, 5; Lockwood Creek, 7; Ganong Creek, 4; McLellan Creek, 3; Van Gilder Creek, 3; Dalziel Creek, 4. Speckled trout.
Paris—Paris Creek, Upper Buckhorn Creek, Sandburg Creek,

2; Big Stone Creek, 6; Blodgett Creek, 5. Speckled trout. Location of Michigan Fish Commission hatchery for trout.

Reed City—Hersey River and branches, 3. Speckled, rainbow and German trout.

Baldwin, Chase, Hersey, Evart—These stations are on the F. & P. M. R. R., reached via Reed City, and have good trout streams in vicinity.

Luther—Little Manistee River, Pine River, 6; Silver Creek, 6; Baldwin Creek, 6; Beaver Creek, 5. Speckled and rainbow trout.

Ashton—East and west branches of the Hersey River. Speckled trout.

Le Roy—Beaver Creek, 3; Pine River, 4. Speckled trout and grayling.

Tusting—Pine River and branches, 3 to 5. Speckled trout and grayling.

Candillac—Pine River, 6; Clam River, 8; Poplar Creek, 10; Big Clam Lake, 4; Long Lake, 6; Round Lake, 8; Sec. 10 Lake, 10. Speckled trout and grayling, pike, pickerel and bass.

Lake City—Hopkins Creek, 4; Muskegon River, 7. Speckled trout, pike and bass.

Manton—Hopkins' Creek, 9; Cedar Creek, 1; Morrissey Creek, 6; Buttermilk Creek, 5; Chase Creek, 5; Silver Creek, 6. Speckled trout and grayling.

Walton Junction—Fife Lake Creek, 2; Walton Creek, Hopkins' Creek, 5; Flower Creek, 3½; Cole's Creek, 3; Cedar Creek, 2½; Potter's Creek, 2; Buttermilk Creek 5; Silver Creek, 6; Duffy Creek, 6; Twenty-Two Creek, 10; Manistee River, 2. Speckled trout.

Alba—Jordan River, 4; Cascade River, 3; Green River, 4; Cedar River, 7; Stevens' Creek, 7. Speckled trout.

Elmira—Sturgeon River, 7; Jordan River, 5; Warner Creek, 4. Speckled trout.

Boyne Falls—Boyne River, Deer Creek, 3; Finley Creek, 3; Spring Brook, 3½. Speckled trout.

Clarion—Bear Lake, 2; Bear River, 2; Spring Brook, 2; Hay Marsh Creek, 5. Large and small-mouth bass, pickerel and perch, speckled trout.

Petoskey—Tannery Creek, 2½; Minnehaha Creek, 4; Horton Creek, 8; Bear River, 1. Speckled trout.

Conway, Oden—Crooked Lake, Round Lake, 1½. Grass pike, black bass, blue gills, silver eels and muskallonge.

Alanson—Crooked Lake, Pickerel Lake, Grass Lake, Cedar Creek, 4½; Minnehaha Creek, 4. Muskallonge, pickerel and bass, trout.

Brutus—Burt Lake, 4½; Maple River, 1½. Bass and pickerel, speckled and rainbow trout.

Pellston—Douglas Lake, 5½; Maple River, Cold Creek, 5. Muskallonge, bass, pickerel, speckled trout and rainbow trout.

Carp Lake—Carp Lake. Muskallonge, bass, pickerel and perch.

Not Destroyed.

The big dam at Bonaparte, Ia., which for years has cut off all the run of fish up the Des Moines River, is not to be destroyed after all, it seems, but a fishway is to be put in. The Winterset News takes the right ground on this point when it says that this fishway must be a fishway and not a fish trap. The News fought for the destruction of the dam, its editor being a man who likes to wet a line now and then, and who also likes to see this good stream occasionally wet a fish. E. HOUGH.

1206 BOYCE BUILDING, Chicago, Ill.

Hockhocksens and Pine Brook.

ASBURY PARK, N. J., April 9.—Local newspapers are aflame over an alleged outrage to trout fishermen of the Hockhocksens and Pine Brook. If the report is verified, as seems entirely probable, there is trouble brewing for some State officials.

These streams are the only ones in this county which can justly lay claim to being trout streams, a liberal supply of young trout having been placed in both of late, and the customary notices posted in relation to prohibition of fishing for three years by the State wardens. At this none were inclined to grumble, as it is a well-known fact that both streams have been overfished for years. It is claimed that on April 1 several deputy wardens, the ones in fact which posted the notices, together with a coterie of city friends, fished both streams from beginning to end, taking a large number of fish of a very questionable size. The angling fraternity are up in arms and are prepared to make matters warm for the trespassers. This is vandalism pure and simple, and makes a farce of the law, which is of the wisest conception, and baffles the work of our Commissioners, which is of the most honest kind. If the assertion is proven, their names should be published and copied by every sportsman's journal in the land, as a stench in the nostrils of decency. LEONARD HULIT.

Florida Needs a Fish Commission.

From the Tampa Herald.

IN another column is printed a very interesting editorial article from FOREST AND STREAM, the leading sportsman's journal of the country, in which is drawn a strong contrast between Maine and Florida in the respect of preserving game and fish. It should be reproduced in every paper in the State and taken as a text by every crowd of men who meet together. In a little while we will have neither game nor fish in Florida at the present rate of destruction.

More than anything else do we need a fish commission, and next to that a fish-propagating station or hatchery. Both these could be secured without much trouble if public interest were once aroused. We commend the article to the careful perusal of every citizen of the State, and its reproduction to our brethren of the press.

A Lecture on Fish.

MR. FRED MATHER will give his lecture on fish and fishing in the public school series, at No. 523 West Forty-fourth street, this city, Thursday evening, April 21.

FOR SALE.—Hunting and fishing preserve in Adirondacks. 12,000 acres forest land; several fine lakes, 15 miles trout streams. Deer in plenty. 14 miles from railroad. A. A. Leonard, Knickerbocker Athletic Club, New York.

Camp-Fire Flickerings.

"That reminds me."

IN the early part of this century the town of Galt, Ont., and its neighborhood were settled mainly by farmers from Dumfriesshire, Scotland. The most of these settlers were Presbyterians, and entertained very strong views as to the observance of the Sabbath. Some years ago an able and conscientious divine, the Rev. James K. Smith, was the pastor of the largest Presbyterian church in Galt, and among his many other good points he was an enthusiastic and successful fisherman.

A cold spring creek runs through the town of Galt, taking its rise some miles away. At the time of the in-

cident about to be mentioned this stream was well stocked with speckled trout.

Very, very early one Monday morning two jolly fellows of the fishermen tribe left Galt for a point on the creek, about nine miles away, thinking they would have the stream all to themselves. What was their surprise to find a buggy ahead of them in the yard of the place they put up at, and later to meet on the stream its inmates, the Rev. James K. Smith and his two sons. In the conversation that ensued one of the jolly fellows, after cogitating a while, and putting his head on one side addressed the reverend as follows:

"Meenister, ha' ye no been a-croodin' o' the Sawbath?"

The Kennel.

Death of Alabama Girl.

GREENBRIER, Ala., April 7.—*Editor Forest and Stream:* It is with deep regret that I am forced to chronicle the death of Mr. H. H. Mayberry's famous pointer bitch Alabama Girl, at my kennels, Sunday, the 3d inst., of hydrophobia. Her loss is irreparable to her owner and to the pointer interest of America.

As a field dog Alabama Girl had but few equals of either sex; and her affectionate disposition made her a most lovable companion. Her winnings in the field and upon the bench were as follows: Divided third in Derby (pointers and setters), Manitoba Trials, Morris, May, 1896; first in Derby (pointers and setters), Alabama Trials, Madison, Ala., February, 1897; first in all-age stake (pointers and setters), Alabama Trials, February, 1898.

In March, 1897, she was taken from the field, and without being conditioned was exhibited in the St. Louis

ZED.

Bench Show, where she won second in field class and third in open class.

Alabama Girl was by Von Arron out of Lady Mull, and was born May 1, 1895. At the time of her death arrangements had been made to mate her with Young Rip Rap, and could it have been, a litter of magnificent performers would doubtless have been the result.

WM. M. HUNDLEY.

New Field Trial Club.

The Western Field Trial Association has been formed at St. Paul with the following preliminary officers: Stuart B. Shotwell, Jr., St. Paul, President; William B. McLean, Minneapolis, Vice-President; E. D. Brown, Minneapolis, Secretary; and Elton P. Roberts, St. Paul, Treasurer. The great trouble with the trials in the Western States of recent years has been the scarcity of birds. Granted abundance of birds, this club might very well succeed in its attempt to inaugurate a Western circuit. Its trial schedule is given as follows:

First—A Derby (amateur) open to dogs whelped subsequent to Jan. 1, 1897, owned in Minnesota, Wisconsin, Iowa, North Dakota and South Dakota, and to be handled by non-professionals. Purse \$100.

Second—An amateur all-age, in other respects like the Derby. Purse \$100.

Third—A free-for-all, open to dogs that have never won first in any recognized field trial. Purse \$300.

Iowa Field Trial Association.

Sportsmen of Burlington, Ia., have set about organizing the Iowa Field Trial Association, with the intention of securing at least fifty members. If everything goes well trials will be held the first week in September, with two stakes, a Derby and an all-age. The following gentlemen, all of Burlington, Ia., are the inaugurators of the movement: Messrs. John A. Gregg, C. E. Perkins, J. W. Blythe, Carl Leopold, W. L. Cochran, and W. W. Parsons.

Zeb.

The portrait of Zeb (Kemp B.—), winner of first in the Derby of the Eastern Field Trials Club last November, is excellent, and faithfully portrays him as he appeared on point in that contest. He is a black pointer, with no special claim to beauty of form, but that is not a quality which counts for much in the finding of birds and the making of points. Zeb is owned by Mr. Victor Humphreys, of Lexington, N. C., who handled him in the contest which led to victory. It was Mr. Humphreys' first attempt, and the success was correspondingly pleasing. The portrait can be recognized at once as coming from the hand of that master of the brush, Mr. Edm. H. Osthaus.

Hachting.

Memories of Boating Days.

(Concluded from page 295.)

That which we had been anxiously and impatiently waiting for being settled, we had nothing to do but make sail and proceed on our cruise. The wind continued from the same quarter as yesterday, and under a full spread of cotton we plowed along down the Jersey shore past Point Comfort, Bayside Beacon and Monmouth to Sandy Hook Bay. Running up by the Horseshoe, we entered the Navesink River, passed through the drawbridge just below the Highland lights, and keeping on, turned to the north and entered the North Shrewsbury. We worked up as far as Oceanic, then standing over to the north side of the river toward Chapel Hill Beacon, we anchored.

It was a very hot day, especially after the breeze had abated, and the Doctor complained frequently of a se-

vere headache. We spent the remainder of that day in listlessly lying around, and sometimes going in bathing. The captain and Mr. R. went off in the tender, and were gone for a couple of hours, returning with about thirty crabs which they had captured along the bank of the river. The doctor and I caught several which came swimming along on the surface of the water close to the yacht. It began to rain shortly after dark, and we turned in early. When we arose the sun was shining brightly. We were to meet a friend of Mr. R.'s to-day at Highland Beach; and he was to accompany us for the remainder of the trip.

We started down the river with the ebb tide, and when nearly to the point of the Highlands ran aground on a sandbar in the middle of the stream. After a vain struggle to release her we had to give up the job, as she was hard and fast, and the water leaving her all the time. There was no help for it now, and we got into the tender and began to look for crabs to pass the time. The water being only knee deep, some of us waded around. While doing this we discovered hard clams in the mud, and we proceeded to secure them. In an hour's time we had a peach basket full of assorted sizes. We found that they were in excellent condition, and for the remainder of the trip we did not want for the bivalves.

About 10:30 Mr. R. and I took the tender and rowed down the river to the steamboat landing, where we were to meet his friend when he arrived on the 11 o'clock boat. The steamer arrived before we got there, but we found the party we were looking for. All we had to do now was to wait until my brother and the doctor came down in the yacht. The tide had begun to run in, and she would probably float within an hour; so we made ourselves comfortable on a handy hotel piazza. The view from here was fine, as one could look out over the ocean without anything to interfere between. Steamers and sailing vessels of all kinds were passing up and down outside the beach, and with their white sails all spread to the light breeze they formed a charming picture. To the southward was Seabright, with its gay assortment of cottages stretching away down the

beach toward Long Branch. While watching a steam launch, called the Jersey Lily, pursuing her way into the South Shrewsbury River, and noting her course, we observed our yacht coming around the Highlands out of the North Shrewsbury. Without waiting for her to arrive we got into the boat and rowed up the river until we met her. As soon as we were on board the course was changed, and we started into the south branch of the river. Passing through the drawbridge, we kept on for a short distance, and then turned sharply to the right. The wind was blowing a rattling breeze now, and we were making good time. Before us lay Pleasure Bay, but we could see but one or two sails on the whole expanse of water. Any but a very light draft boat is liable to come to grief here, as the bay is very shoal, with but a narrow channel winding through the middle of it. We were attended with exceptionally

"A Try at the Bluefish."

good fortune, for although we stirred up the mud several times, only once did we really get aground, and then for a few minutes, getting clear by a good lot of shoving.

About 2 o'clock we anchored at Pleasure Bay landing, close to another drawbridge, and but two miles from Long Branch. We would have liked to go to the above-named place, but the river is not navigable much further although a steamer runs through for about a mile beyond this place. It was here that the doctor left us; his head, which he concluded had become slightly affected by the sun, troubled him to such an extent that he packed up, and when the steamer came through from Long Branch he boarded her for New York. We stayed here until 5 o'clock, and then departed for Highland Beach, which we reached a little after dark, and anchored inside the bridge.

We spent part of the night on shore, and when we came on board it was with the intention of getting under way for Sheepshead Bay in the morning. It was cloudy when we awoke, and a raw sort of a wind was whistling in from the southwest.

Once outside the Horseshoe we got the full benefit of the breeze, and Monaitpee began to jump into the sea at a great rate. When near the Government dock inside the Hook a sudden squall struck her, and she went down until the water came pouring into the cockpit; but she got her feet again and shot away like a bird. The wind held good until we were well off the point of Sandy Hook, when it fell to a light topsail breeze. So up went the topsail, and we kept on past the Dry Romer and other shoals until well over. Then for a while the wind died out completely, and left us rolling and tossing about, a plaything for the waves.

For nearly an hour this continued, when, catching a light puff, we were enabled to get inside of Dry Bar, where the water was smooth, which I have no doubt was an agreeable change to Mr. R.'s friend. Running up Dead Horse Channel to Richard's Point, we cast anchor. While I got dinner ready the rest of the crew got out their lines and began fishing, and in about a half hour quite a lot of flukes and blackfish had been landed into the box used for their reception.

This fish box of ours is built under the seat in the after end of the cockpit, the seat forming a cover, which is hinged and can be quickly opened. A pipe leads from the box out under the overhang. It can always be kept clean by dashing water into it, which immediately runs out through the hole. We consider this box a valuable feature of our craft, as we do considerable fishing in a small way.

After the repast had been partaken of, sail was got up, and we ran over to a sandhill on the west point of Barren Island and went in swimming. We stayed here until 5 o'clock, when it began to rain and blow from the sea; so we started up the bay. Before we reached our anchorage it was blowing a two-reef breeze, but unwilling to stop to reduce sail for so short a distance, we held on and came up with lee deck under to the cabin windows, the water sometimes slopping over into the cockpit. Short work was made of the last half mile, and we rounded up at our buoy amid a rattling of blocks and a terrific slatting of canvas.

Our principal reason for getting back on Friday was that our passengers might have a try at the bluefish in Rockaway Inlet and vicinity; so next morning about 3 o'clock we ran down just outside the inlet and tried still-fishing for a short time, using spearing or white bait, but only taking a few small snappers. We got up sail and steered for a school that we observed jumping not far off, throwing out the squids in the meantime. Having very good headway, we dashed right into the animated mass of fish, and immediately began hauling in; none weighed over 2lbs., as the large fish do not come in around this place. However, quantity made up for lack of quality, if the small bluefish can be called inferior to the large; and when we wound up the lines on our way home the fish box was well filled.

We landed at Point Breeze and had dinner. Here we were met by our regular cook, who arrived in a small boat just in time to see us filling our pipes after the feast.

During the winter that followed extensive alterations were made in Monaitpee, and when she made her debut in the spring of 1889 one would scarcely have recognized her as the same craft. The centerboard and trunk had

been taken out, the slot in the keel filled in, and an iron keel bolted on outside. The after overhang was lengthened, a new deck laid, and a new cabin trunk and all interior arrangements added. A larger sail plan necessitated new spars, rigging, etc. The idea of changing

Single Blessedness.

her to a keel boat had been discussed between us for a long time, and it was with some trepidation that we undertook to make the alteration.

The cook shook his head sorrowfully as he saw the centerboard ripped out.

"I am afraid we are making a big mistake," said he.

But it was not a mistake. Our main object in doing this was to get more stability, and at the same time better cabin accommodations, and we got both. She was a better boat in every way afterward.

Well, why should I continue this yarn further? If I undertook to relate all the incidents of our boating career, more space would be required than FOREST AND STREAM would be willing to allow, and I fear the reader may have already become wearied. We are sometimes

very apt to think our experiences as interesting to others as to ourselves. The succeeding cruises on Long Island Sound have already been described in these columns.

Two years after Monaitpee was transformed I severed my connections with her and signed articles for a voyage through life with a new mate. She proved to be almost as fond of the water as myself, so I built an 18ft. cabin cat, and for three years we plowed the deep together. Torn from her mooring one night in a severe storm, she was almost completely destroyed, along with a dozen other boats. It was near the end of the season, and I hauled her up, and the following winter sold her.

I rejoined Monaitpee, but shortly after our cook surrendered himself to the allurements of matrimony, and practically deserted the ship. His yachting career has since been confined to the reading of this department of the FOREST AND STREAM. The captain built himself a small knockabout, and became so enamored of it that I soon found it next to impossible to muster a crew together, and Monaitpee consequently spent most of her time at her moorings, the result being that in the spring of 1895 we sold her to a member of the Brooklyn Y. C.—and I guess she is there yet.

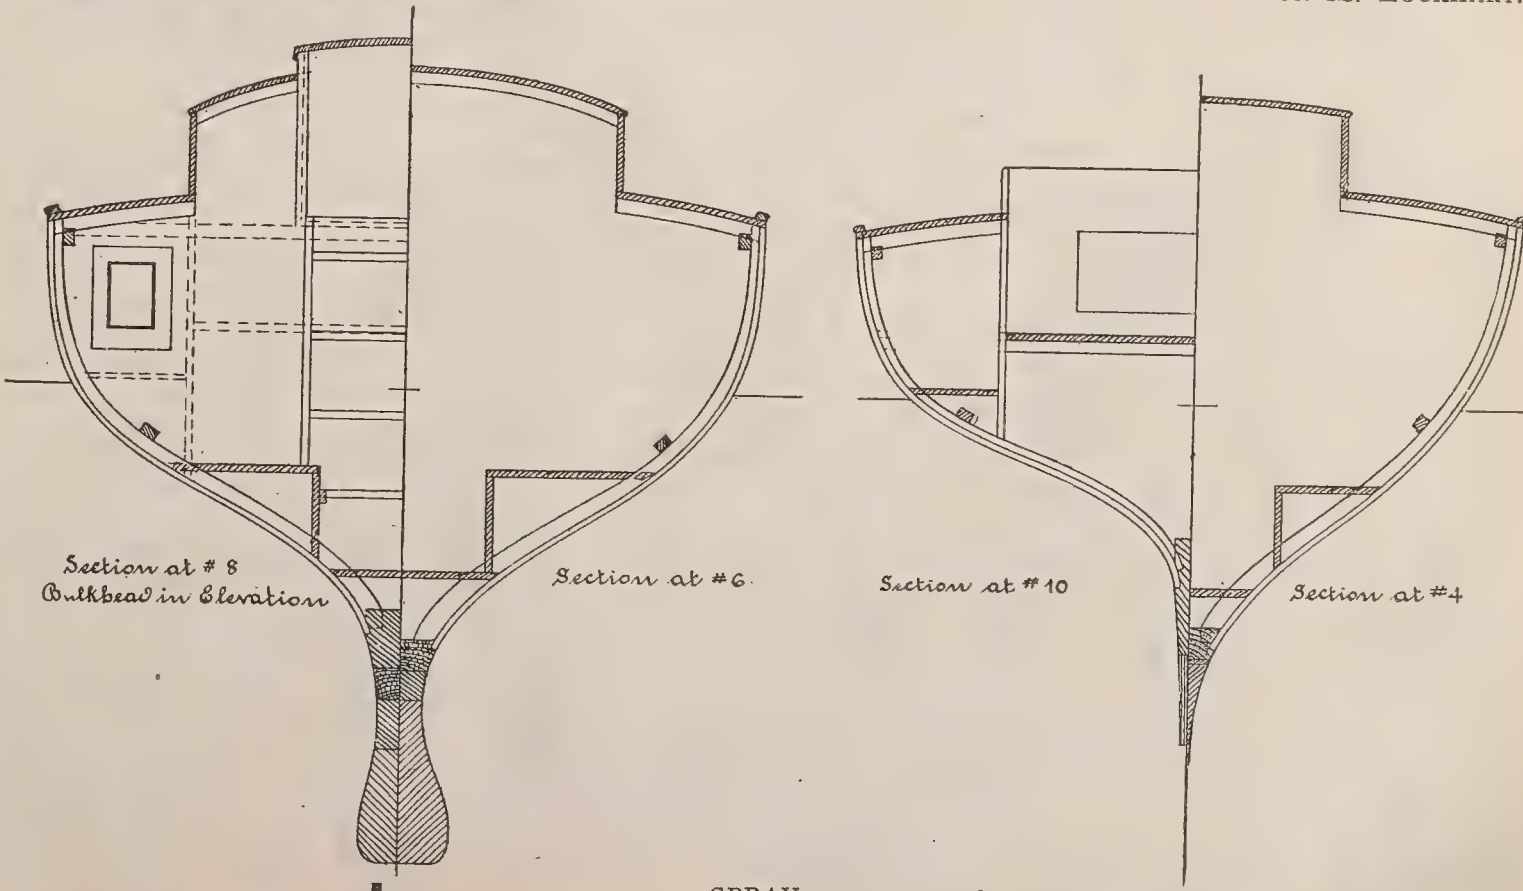

I immediately made the drawings for another boat, and three months later launched the Athlete, a boat of the knockabout type, 17ft. over all, 12¹/₂ft. waterline and 6ft. beam.

Plum Beach has undergone great changes during the past few years. Where there were once only two shanties there are now some twenty odd, and in summer months it appears quite a village.

On the site of the old "Clam Chowder Hotel" a new building has been erected, and the captain of Monaitpee sits on the piazza, lazily smoking his pipe, and occasionally takes a spin in his little Nina. For a companion he has a friend who bears the name of Friend, and who has the record of being the oldest inhabitant. They live happily together, and the captain sometimes observes, when some of us drop in to partake of their bachelor hospitality:

"See what you fellows might be enjoying if you had only had sense enough to stay single."

A. M. LOCKHART.

SPRAY.

Spray.

21ft. Fast Cruiser.

(Continued from page 294, April 9.)

We give this week the cabin and deck plans of the design published in our previous issue, with table of offsets. The sail plan and details of construction will follow next week.

Torpedo-Boat Destroyers.

The probability of a war with Spain has brought into prominence within the past few weeks the term "torpedo-boat destroyer," heretofore unknown on this side of the water, outside of naval circles. The fact that these new and formidable engines of destruction, of which Spain now has eight in commission and the United States none, are likely to play very important parts in a naval war, makes the subject of sufficient general interest to warrant the reproduction of the accompanying illustrations and description, published in the English journal, *Engineering*, of January 1, 1897, just after the completion of the vessels. The two sister craft, *Furor* and *Terror*, are of more immediate interest than any others, as they are now at the Cape Verde Islands as part of the first Spanish squadron.

The torpedo-boat destroyers *Furor* and *Terror*, designed and built by Messrs. James and George Thomson, Limited, Clydebank, to the order of the Spanish Government, have now completed their trials and have arrived in Spain. Although similar in general design to the destroyers of the British navy, there are several departures in detail, and the vessels are in some respects more nearly akin to the torpedo gunboats. For example, they are fitted with teak upper decks in addition to a complete steel deck; double awnings for the whole length of the vessel, with side curtains hanging to the water's edge, electric lighting throughout and a number of electrical ventilating fans for insuring a supply of fresh air to the officers' and crew's quarters; so that the vessels will be much more habitable than an ordinary torpedo-boat destroyer when serving in the tropical or semi-tropical climates for which they are intended. The contract provided that the mean speed should be determined by four runs on the measured mile, and by a further trial of two hours' duration, during which the speed should not be less than 28 knots. It was further stipulated that a load of 75 tons should be carried on trials, which is more than twice the load required in the case of vessels of a similar type built for the British navy.

The vessels have a length of 220ft., breadth 22ft., and have a moulded depth of 13ft. The loaded displacement is 380 tons. The armament consists of two 14-pounder quick-firing guns, the one mounted forward on top of the conning tower and the other aft; two 6-pounder guns of the same type mounted on the broadside, and two 37-millimetre automatic quick-firing guns, one on the starboard and the other on the port bow. All these guns have been supplied by the Maxim-Nordenfeldt Guns and Ammunition Company, Limited, and are of the latest and most improved pattern. Their position in the ship is shown by the deck plans given on the present page. The vessels are also equipped with two torpedo tubes, 14in. in diameter, mounted on the upper deck, so as to fire off either side of the ship (Fig. 3). The torpedo tubes are on the Schwartzkopff system. Four torpedoes are carried, and there is, of course, a complete installation of air-compressing machinery for charging them, the engines and pumps being in the engine room.

After some preliminary trials, the *Furor* successfully passed her official forced draft trial on October 30, 1896. The mean speed of four runs on the measured mile exceeded the contract by about a quarter of a knot, and the revolutions were maintained without difficulty for the two hours' trial. The *Terror*, after a single preliminary trial, completed her natural draft trial, and at the next succeeding trial, successfully completed her official forced draft trial. The natural draft trials were of the same duration as the forced draft trials, and it was provided by the contract that a speed of $21\frac{1}{2}$ knots be maintained with the air pressure in the stokeholds not exceeding $\frac{3}{4}$ in. of water. It was found that this speed could be maintained with very great ease; indeed, the stipulated speed was exceeded by about a knot.

After the speed trials, the firing trials of the guns were carried out to the entire satisfaction of the inspecting officers. The terribly destructive nature of the fire, especially from the automatic guns, was very apparent, a perfect hail of projectiles of 37 millimetres or about $1\frac{1}{2}$ in. in diameter being delivered by these guns, and continued so long as the person firing the gun kept his finger pressed on the trigger, the whole of the operations of loading and firing being automatically performed by the energy of the recoil.

The vessels are fitted with steam steering gear of the type usual in torpedo-boat destroyers. The engine, which is of the vertical pattern, bolted to the after bulkhead in the engine-room, was supplied by Messrs. Caldwell & Co., Limited, of Glasgow. The steam capstan gear is driven by a horizontal two-cylinder engine, supplied by Messrs. Napier Brothers, Limited, also of Glasgow.

The vessels are propelled by twin screws, each propeller being driven by an independent set of four-cylinder triple-expansion engines situated in one compartment aft of the boiler rooms. Steam is supplied by four boilers of an improved Normand type, placed in two water-tight compartments. These are fired from two stokeholds, the furnaces of the forward and aft boilers discharging into separate funnels, while those of the two center boilers lead up to a common central funnel of larger size. The cylinders, which are entirely independent castings, are bolted together, and are stayed transversely between each other, and also to gusset plates in the wings, connecting the deck beams and frames. A pair of struts extend from each of the high-pressure cylinders to gusset plates between the deck and forward bulkhead of the engine-room, and similar ties secure each of the aft low-pressure cylinders to the structure of the vessel. The cylinder bottoms are separate castings, and are bolted to the cylinders, and they, together with the cylinder

FUROR—TERROR.

Spanish Torpedo Boat Destroyers, now at Cape Verde Islands en route to the West Indies.

covers and the top and bottom covers of the valve casings, are of cast steel. The pistons are of forged steel, turned all over, and are fitted with two Perkins' metal rings. The piston and connecting rods are of wrought steel, and are hollow. The crosshead pin is fixed into the forks of the connecting rod, and is of steel, case-hardened. The piston-rod guide and head are forged with the rod, and the guide has machined recesses on the "ahead" side, which are filled with white metal. The "ahead" guide faces are of cast iron, with water circulation at the back, and the "astern" faces are of bronze.

The bedplates are of cast steel; each consists of two angle-bar-shaped castings, which extend the whole length of the engine and rest on longitudinal frames extending between the engine-room bulkheads. The main bearing frames extend between, and are checked into, these castings, being secured to them, as well as to the floors of the vessel, by fitted bolts. The main bearings are eight in number, and wrought-steel columns braced together near the center form the connection between the cylinders and these frames.

The crankshafts and pins are hollow, and are of steel. The high-pressure and intermediate pressure cranks are arranged opposite each other, and each pair of cranks is forged in one piece. Balance weights are fitted on the crank webs, reducing the vibration to a minimum. The thrust and propeller shafts are also of steel, and

are hollow. The propellers are three-bladed and are of manganese bronze, each being cast in one piece.

The condensers are placed in the wings, and are of brass. The steam is condensed outside the tubes, and the water is circulated through them by a natural flow, due to the speed of the vessel through the water, two of Gwynne's pumps being fitted as auxiliaries. The air pumps are single-acting, and are driven by cranks off the forward ends of the crankshafts, discharging into a common hotwell tank.

The boilers are fitted with galvanized steel tubes. They are worked under forced draft on the closed stokehold system, the air pressure being supplied by two single-breasted fans in each stokehold, placed one on either side on the bunker bulkheads. The engines are of the open vertical type, and air is admitted to the fans by large cowls placed directly overhead.

The boiler feed arrangement is most complete, consisting of a main and auxiliary system of feed pumps and pipes, which are separate and entirely independent of each other. The main system consists of two of Messrs. G. and J. Weir's special feed pumps, placed at the forward end of the engine-room. Each draws from the hotwell tank through a Harris patent feed-water filter, discharging either to the boilers in one compartment direct, or through one of a couple of Messrs. Weir's feed-water heaters, situated on the for-

ward engine-room bulkhead between the pumps. The feed-water discharge to each boiler is controlled by a special automatic feed regulating arrangement, which keeps the water at a steady level in the boiler, greatly relieving the engineer in charge. For the auxiliary system a similar feed pump is placed in each boiler-room, and each pump is connected by separate pipes with the reserve fresh-water tank, the hotwell tank, and the sea, and discharges direct to the boilers. The pump in the after boiler-room also discharges to the deck, and serves the purpose of a fire pump.

The main steam pipes are of galvanized steel. An independent pipe extends between each boiler-room and one set of engines, and each pipe is fitted with a stop valve and steam separator on the engine-room bulkhead, thereby insuring dry steam in the engine. There is also a connecting pipe between the main steam pipes, and an equilibrium valve at each high-pressure cylinder. An independent auxiliary steam pipe supplies all the auxiliary engines, except the main feed pumps, and the exhaust steam is led by a system of pipes to either of the main condensers.

A large evaporator is situated amidships, on the after engine-room bulkhead, capable of evaporating 3,150 gallons of fresh water per day, with a distilling condenser beside it which can supply 560 gallons per day of pure aerated fresh water, chiefly used for ship purposes, the remainder of the vapor being condensed in the main condensers to serve as make-up feed. A separate engine, with pumps, is also fitted for maintaining the water level in the evaporators, circulating the condensing sea water, and pumping the drinking water into the ship's tanks. An auxiliary air pump is fitted to each of the circulating pumps, and is connected to the bottom of the main condensers, discharging to the hotwell tank. On the after engine-room bulkhead there is also a duplex bilge pump for clearing out the bilges of the engine and boiler rooms, and ejectors have also been fitted to each compartment, so that in case of excessive flooding the water may be rapidly got rid of.

The supervision of the trials, on behalf of the Spanish Government, was in charge of the Spanish Naval Commission, under the presidency of Com. Camara. The constructive department of the Spanish Navy was represented by Capt. Talero, and there were also present Capt. Peral and Capt. Carlier.

Podgers on Yacht Stoves.

SAN FRANCISCO, March 29.—*Editor Forest and Stream:* I see by one of the last numbers of the FOREST AND STREAM that the subject of yacht stoves is under discussion, and sundry gentlemen give their experiences. Having wrestled with that problem to a considerable extent, I herewith contribute the consensus of my opinion on the question.

My first cruises were in a 32ft. sloop, in which I used various patterns of oil stoves that in mild weather heated the cabin to an uncomfortable degree, besides the unpleasant odor, and one or two narrow escapes from burning up the yacht. The next plan adopted was to cut off about 2ft. of the cockpit transom from the end nearest the bulkhead, lining the recess with zinc, rendering it fireproof, and to have a sheet-iron cook stove made to fit, and the whole inclosed by a door with a movable joint of pipe. The stove burned both wood and coal, which was stored under the cockpit seats, as well as the utensils. It answered admirably and cooked quickly. Having four openings, several dishes could be cooked at the same time. With a substantial rainproof awning inclosing the cockpit and a knock-down table, it made a cozy dining room when at anchor.

Another arrangement for cooler weather was a two-burner reservoir oil stove, which I placed at the after port side of the cabin in a recess at the aft end of the transom, in precisely the same manner as in the cockpit, boxing in and shutting up from sight when not in use. It took up 2½ft. from the transom, and gave space to hang the lighter utensils. To avoid removal in order to fill the oil reservoir, I had a sheet-iron tank made, 18x4in. and 36in. high, placing it in the corner outside in the cockpit against the bulkhead, with a feed pipe through the bulkhead to the stove reservoir, with a shut-off cock. The tank was boxed in, and took up but a trifle of space, and when filled lasted a whole season. A small hatch over the stove permitted all odor of oil and cooking, as well as heat, to escape.

A stove placed in that manner near the companionway obviated any discomfort in cooking, and was handy to the dining table, and being closed up when not in use had the appearance of a locker. A rack for plates and cups, and receptacles for spoons, knives and forks, over the stove on the sides made a little handy pantry.

I cannot imagine anything more inconvenient than the style of most Eastern yachts, of having the cooking stove placed under the forward deck, unless your cook is a very short man, as the deck is low and he must duck under the carlin to bring his cooking to the cabin table, besides the distance. Better have your kitchen at the forward end of your cabin under the house. The space sacrificed is small, and with a hatch over the stove to let out the heat your cabin is not uncomfortable even in warm weather, to say nothing of the comfort of the cook in being able to stand up instead of being doubled up like a jack-knife, especially if the duty falls upon an amateur member; but if your boat is small the oil stove is the thing if arranged as described.

Another item of utility and a great convenience in that connection is to place your companionway on the port or starboard side of your cockpit (whichever side your stove may be), instead of amidships, firstly for coolness for the cook; secondly, it gives a space in the cabin for an extra berth or sofa athwartships, or for lockers for guns and fishing rods, pantry, book rack, clothes locker, or whatever uses you choose to put the space to; and last, and not least, a place where you can lock up securely your snake-bite remedy, with the satisfaction of knowing that in case of such an accident you know that the cook has not during your absence imagined that a mosquito bite demands the same heroic treatment.

Most of us know from experience the universal weak-

ness of cooks and the average sailor man for the cup that both cheats and inebrates, and when the demijohn is left in a locker without a lock the temptation is too strong to be resisted, and you may come aboard to an expected good dinner with an appetite that would carry consternation to a boarding-house landlady, to find the artist fast asleep on the transom and the stove as cold as your dog's nose; and in case you have brought aboard a friend or two to dine with you it is presumable that your language would not meet with approval in polite circles. I have had it happen times enough to have learned that it is safest to put temptation under the most complicated lock you can buy.

Our cooks are generally Chinese or Japanese, and it is to be said to their credit that they never molest your small stores. I have employed them afloat and ashore for years, and have never known one of the many I have employed to be dishonest or to touch wines or liquors. As a contrast, I have seldom known a Meliky man cook that could be trusted when the key was left in the locker door, and here's where the heathen rises superior to the aforesaid Meliky man. Give the heathen plenty of tea and rice, and he is happy and cheerful, and your small stores remain intact.

PODGERS.

The Fin-Keel and Scow Types.

NEW YORK, April 11.—*Editor Forest and Stream:* Answering Mr. Warrington in your issue of April 2:

In the issue of March 26 I said that the futility of his rule would be shown by the use of "such a form as Freak without the fin, but with a centerboard until the limit of crew as ballast is past."

If we are going to design a boat to compete with the full-bodied fin, we would take Freak, reduce to 10ft. beam, reduce the sail area to 494sq.ft., and then we have the following characteristics. For equal rating:

	Sail Area.	Displacement.	Wetted Surface.
Fin	480	7,450	100%
Freak	494	2,500	66%

If these two yachts compete together, it is quite evident that the full-bodied fin has absolutely no chance, except possibly under conditions of wind and weather so severe as to lead to the postponement of a race.

The formula given by you, on Mr. Herreshoff's authority, wherever the condition obtains of L.W.L., measured when the yacht is erect, can be easily beaten with the scow type. The rule containing a function of the midship section can be easily beaten, as I show in the Freak design. The rule for displacement, considered entirely alone or eliminating L. W. L., may give good results. The same thing is true to a less extent of the rule for cubic contents, but as they stand with the function of L.W.L. as above noted, there is absolutely no difficulty in designing a most objectionable form of fast boat.

GEORGE HILL.

YACHTING NEWS NOTES.

Sovereign, steam yacht, just sold by M. D. C. Borden to the U. S. Government, has been re-named Scorpion. She is now fitting out at the Brooklyn Navy Yard.

Kanapaha, steam yacht, Rev. R. L. Moore, has been chartered to Chas. R. Flint, and after hastily docking sailed on April 5 from New York for the South.

Hildegard, aux. steam yacht, B. M. Whitlock, converted last year from a sailing vessel under schooner rig to an auxiliary brig, is now undergoing new alterations, including bark rig, new deck house, bridge, etc.

Nahma, steam yacht, Robert Goelet, after coaling at Fall River, will sail this week from Newport to Glasgow, where some work will be completed.

On April 9 the Queen City Y. C., of Toronto, elected the following officers: Com., Owaen Martin, acclamation; Vice-Com., Wm. Lee, acclamation; Capt., R. Slee, acclamation; Treas., W. J. Foy; Meas., A. P. Miller; Auditors, W. D. Thomas and P. Endress. Sailing Committee: F. Parkinson, J. C. Unwin and R. J. Hales. House Committee: W. Wilkinson, W. Duncan and W. J. Hutcheson; Secretary, Harry S. Jones.

The Ocean Y. C., of Staten Island, elected the following officers on April 6: Com., Theodore F. Glaser; Vice-Com., Joseph Barth; Rear-Com., Julius C. Muller; Sec'y, George W. Stapleton; Meas., William V. Johnson; Treas., John H. Boldt; Fleet Captain, William Lindsey; Trustees: Rudolph Michel, Louis Birkle and James A. Dunn.

Mariposa, knockabout, has been sold through Messrs. Jones & Crowninshield to Mr. McCord, of the Indian Harbor Y. C. Mariposa hails from Beverly, Mass.

Mr. Arthur Iselin has recently spent some time at Marblehead trying his new knockabout Dipper, the first afloat of the Seawanhaka fleet, with very satisfactory results. She will be shipped to New Rochelle this week. Mr. Stearns has orders for three more of the Cohasset design, two for New York owners. They are centerboard boats, with but 3ft. 6in. draft and a deeper board than the Seawanhaka design, with 3,000lbs. of iron on keel and 600sq.ft. of sail.

The Quincy Y. C. has already arranged to build a syndicate boat to defend its cup. The yacht will be similar to the very successful Hoodlum, designed by J. R. Purdon, who will design while Lawley will build her. H. M. Crane has also a new boat of 18ft. l.w.l. under construction at Stearns' shops, and may challenge with her for the Quincy cup.

The Quincy Y. C. announces the following fixtures: June 25, handicap race; July 9, handicap race; July 11, ladies' day; July 23, open race; Aug. 6, handicap race; Aug. 20, handicap race; Aug. 22, first cup race; Sept. 5, handicap race. First cup race Aug. 22. Ve others to follow on succeeding days until winner is determined.

Messrs. Murray & Tregurtha, of South Boston, Mass., are very busy with orders for both launches and machinery, having now in hand three 35ft. steam launches to be used in the Klondike for E. C. Davis & Co., of Boston; a 25ft. mahogany finished launch with 5 horse-power gasoline engine for Severe Dorion, Rochester, N. Y.; a 25ft. gasoline launch for Arthur W. Blake, of Boston; a 22ft. mahogany finished gasoline launch for F. L. Weston, and a 22ft. gasoline launch for L. F. Mongeon, both of Boston. Four 41in. Tregurtha boilers for F. S. Wormer, Arcade, N. Y.; Laighton Bros., Isles of Shoals, N. H.; A. E. Smoot, Alexandria, Va.; and W. E. Phetteplace, Webster, Mass. Two 35in. Tregurtha boilers for the Klondike & Northwestern Mining and Supply Co., of Boston, and L. V. Elder, of Galveston, Tex.; one 32in. Tregurtha boiler for John J. Cattanch, New York city, and three Tregurtha boilers for Murray & Williams, Montreal, Can. For the last mentioned parties they are also building a 3 horse-power gasoline engine, and they have built or are building five 10 horse-power gasoline engines for H. J. Smith, Rockledge, Fla.; H. E. Rogers and N. L. Moore, of Boston; C. H. Williston, of Fall River, and H. H. Buffum, of Abington, Mass. Also an 8 horse-power gasoline engine for Haines Bros., Jacksonville, Fla., and a 3 horse-power for Dr. F. E. Buck, Jacksonville, Fla.

At the annual meeting and election of officers of the West End Yacht Club, of Detroit, Mich., held at the club house on Wednesday evening, April 6, the following officers were elected for the ensuing year: Com., Otto F. Barthel, yacht Ariel; Vice-Com., D. H. Petherick, yacht Eva; Rear-Com., S. H. Ives, yacht Surprise; Fleet Capt., A. L. Boushy, yacht Eva B; Fleet Surgeon, Dr. W. T. Lambert, yacht Yankee; Sec'y, George E. Guest; Treas., Robert Guest; Meas., Peter Arthur; Race Committee: Wm. A. Jones, chairman; Alex. I. McLeod, Ned Baird, D. H. Petherick, Chas. Sieder; Board of Directors: commodore, secretary, treasurer, Col. J. H. Beattie, Walter Dupont.

A. C. A. Membership.

APPLICATIONS for membership may be made to the purser of the division in which the applicant resides on blanks furnished by purser, the applicant becoming a member provided no objection be made within fourteen days after his name has been officially published in the FOREST AND STREAM.

Northern Division.

Harry L. Morse, Wawbewawa Canoe Association, Allston, Mass.
George R. Heckle, Wawbewawa Canoe Association, Roxbury, Mass.

Rifle Range and Gallery.

Louisville Revolver Club.

THE Louisville Revolver Club held its weekly shoot at the Armory, on the evening of April 4. The attendance was poor on account of rainy weather, and it was the first meeting of the club in many months that was not attended by strangers to watch the contests. All arrangements for the Brooklyn-Louisville revolver match have been completed and it will come off on Tuesday, May 24, at 8 o'clock in the evening. Each side will score at home and telegraph the result to the non-resident club immediately after the shooting. This will be a very interesting match and will be watched by sportsmen interested in revolver shooting all over the country. The Brooklyn Club has a national reputation, while the local club has one to make, yet the local cracks are confident of winning the match. Below are the scores in full of the last shoot and rules governing the match:

Ten yards, 2in. bullseye counts 10:	
H S Gilbert	10 10 10 10 10 9 10 10 10-93
E B Dye	9 9 9 9 10 9 9 10 8 9-91
A H Ross	10 10 8 10 9 8 8 9 7 7-84
F M Taylor	10 5 10 8 7 8 8 8 7 6-78
N M Bowie	6 6 2 9 4 3 3 9 9 10-61
Fifteen yards, 4in. bullseye counts 10; 20 seconds for each 5 shots:	
E B Dye	10 10 9 9 8 10 10 9 7 7-89 in 34 seconds.
H S Gilbert	9 9 9 8 5 10 9 9 9 8-85 in 33 seconds.
A H Ross	9 9 7 5 4 9 8 8 7 7-81 in 33 seconds.
F M Taylor	9 9 8 7 4 9 5 5 5 4-65 in 33 seconds.

Twenty yards, standard American target:	
E B Dye	9 9 9 8 4 10 10 9 7 8-83
H S Gilbert	3 9 8 7 8 9 9 8 7 10-78
F M Taylor	7 6 4 2 3 10 9 9 3 1-54

Rules governing match, Brooklyn vs. Louisville revolver clubs: Arms.—Any revolver not less than .32cal. or over .45cal., with barrel not over 7½in. in length exclusive of cylinder.

Sights must be strictly open.

Trigger pull shall not be less than 3lbs.

Position, standing, without rest or support, shooting arm extended, elbow free from body, and only one hand.

Targets.—10 and 20yd. targets to be standard American; 15yd. target to have 4in. bullseye, with first four rings nearest to bullseye lin. apart and the balance of rings 1½in. apart.

This match calls for 15 consecutive shots, which must be finished in 15 minutes from the first shot.

Cleaning will be allowed between scores.

Any ammunition may be used, provided it be factory-loaded shells, service charges, in original sealed boxes, to be opened at time of match.

Distances, 10, 15 and 20yds.

Time allowed on 15yd. target 20 seconds for each 5 shots; for every shot fired after time is called a bullseye (which counts 10) must be deducted from score.

This match will be held at the club's revolver range at the Armory on the evening of Tuesday, May 24, 1898.

The official scorer shall be a representative of a local paper to act for the non-residents.

The result shall be telegraphed to the secretary of each club by official scorer on evening of match, at the conclusion of same. The teams to consist of six men each.

E. B. Dye.

Cincinnati Rifle Association.

CINCINNATI, O., April 3.—The following scores were made by members of the Cincinnati Rifle Association at their range today. Conditions: 200yds., off-hand, at the German ring target. Gindele was declared king to-day with a score of 224; he was also high on the honor target with a score of 69:

In the telegraphic shoot between Cincinnati and St. Louis shooters, each club shooting on its own grounds, St. Louis won by a score of 2,700 to Cincinnati's 1,975.

Greenwood Gun Club.

The second annual tournament of the Greenwood Gun Club, Greenwood, S. C., will be held on May 26 and 27. On the first day there will be five events, one at 5 live birds, \$5, two moneys, 60 and 40 per cent. One at 7 live birds, \$7, three moneys, 50, 30 and 20 per cent. Two at 10 live birds, \$10, four moneys, 40, 30, 20 and 10 per cent. A miss-and-out, \$2.50. There are four events on the programme for the second day. The first is at 5 birds, \$5, two moneys. The second is at 25 birds, \$25, four moneys. No. 3 is at 10 live birds, \$10, three moneys. The fourth is a miss-and-out \$2.50. Ten-gauge guns are barred. All events will be at 30 yds., except second and third events of the second day. In miss-and-out events the price of birds is 25 cents. In other events the birds are included. R. G. McCants is secretary, Greenwood, S. C.

Trap-Shooting.

Fixtures.

April 13-15.—Atchison, Kans.—Manufacturers' fourth annual amateur tournament; \$500 cash added; \$50 high average. Jack Parker, Manager; Lou Erhardt, Sec'y.

April 13-15.—Macon, Ga.—Tournament of the Interstate Association, under the auspices of the Macon Gun Club. F. C. Etheridge, Sec'y.

April 14-15.—Newburgh, N. Y.—Special shoot, Hudson River Trap-Shooters' League, on grounds of Glenwood Gun Club. J. B. Rogers, Manager.

April 15.—Worcester, Mass.—Tournament of Massachusetts State Shooting Association, under the auspices of the Worcester Sportsmen's Club. A. W. Walls, Sec'y.

April 18-20.—St. Louis, Mo.—Tournament for amateurs only at the Du Pont shooting Park, under the management of J. A. Lorr.

April 19.—Brockton, Mass.—All-day shoot for merchandise prizes, first of weekly series. B. Leroy Woodard, Manager.

April 19-21.—Lincoln, Neb.—First annual amateur tournament of the Lincoln Gun Club. Each day \$50 added to the purses. Geo. L. Carter, Sec'y.

April 27-28.—Peru, Ind.—Second annual amateur tournament. Jack Parker, Manager. Address all communications to J. L. Head, Peru, Ind.

May 4-5.—Brunswick, Ga.—Tournament of the Interstate Association, under the auspices of the Atlantic Gun Club. J. H. Polhill, Sec'y.

May 4-6.—Newburgh, N. Y.—Trophy shoot, Hudson River Trap-Shooters' League, on grounds of Newburgh Gun and Rifle Club. J. B. Rogers, Manager.

May 10-11.—St. Cloud, Minn.—St. Cloud Gun Club's amateur tournament. E. S. Hill, Sec'y.

May 10-13.—Des Moines, Ia.—Charley Budd's shoot. First three days, targets; \$350 added. Fourth day, live birds; 25 birds, \$25, handicap, \$50 added.

May 16-21.—Kansas City, Mo.—Annual tournament Missouri State Fish and Game Protective Association. G. M. Walden, Pres., Kansas City.

May 17-20.—Newark, N. J.—Tournament of the New Jersey State Sportsmen's Association, on the grounds of the East Side Gun Club. T. H. Keller, Sec'y.

May 18-19.—Crawfordsville, Ind.—Tournament of the Crawfordsville Gun Club. C. E. Lacy, Sec'y.

May 18-20.—Waterloo, Ia.—Annual tournament of the Waterloo Gun Club.

May 24-27.—Omaha, Neb.—Twenty-second annual tournament of the Nebraska State Sportsmen's Association. F. S. Parmelee, Sec'y.

May 25-26.—Wilmington, N. C.—Tournament of the Interstate Association, under the auspices of the Eastern Dog and Game Protective Association. H. McL. Green, Pres.

May 30.—Canajoharie, N. Y.—Decoration Day shoot of the Canajoharie Gun Club. Targets. Charles Weeks, Sec'y.

June 1-2.—Peekskill, N. Y.—Trophy shoot, Hudson River Trap-Shooters' League, on the grounds of Peekskill Gun Club. J. B. Rogers, Manager.

June 2-3.—Alton, Ill.—Second annual bluerock tournament of Piasa Gun Club. F. C. Riehl, Sec'y.

June 7-8.—Ottawa, Kans.—Annual tournament of the Kansas State Sportsmen's Association. W. L. Beardsley, Sec'y-Treas.

June 7-8.—Indianapolis, Ind.—Annual tournament of the Indiana Trap-Shooters' League, of Indiana, on the grounds of the Limited Gun Club.

June 8-9.—Findlay, O.—Annual tournament of the Magautrap Gun Club. O. B. Marvin, Sec'y.

June 8-10.—Parkersburg, W. Va.—Second annual tournament of the West Virginia State Sportsmen's Association. Address all communications to Ed O. Bower, Sec'y, Sistersville, W. Va.

June 14-15.—Stillwater, Minn.—Tournament of the Stillwater Gun Club.

June 15-16.—Portsmouth, Va.—Tournament of the Interstate Association, under the auspices of the Portsmouth Gun Club. W. N. White, Sec'y.

June 15-17.—Cleveland, O.—Fifth annual tournament of the Cleveland Target Co. Bluerocks thrown free of charge. Professionals and manufacturers' agents barred from programme events.

June 20-24.—Rochester, N. Y.—Annual tournament of the New York State Association, under the auspices of the Rochester Rod and Gun Club. Live birds and targets.

June 21-23.—Sioux City, Ia.—Fourth annual amateur tournament of the Soo Gun Club. Three sets of traps. W. F. Duncan, Treas.

June 23.—Minneapolis, Minn.—Tournament of the Minneapolis Gun Club. G. J. McGraw, Sec'y.

June 27-July 3.—Milwaukee, Wis.—Tournament of Milwaukee Gun Club, carnival week. Live birds and targets. \$1,000 added money.

July 1.—Sherbrooke, Canada.—Grand annual tournament. Targets. Regular sweeps, variety and merchandise. C. H. Foss, Sec'y.

July 6-7.—Meadville, Pa.—Tournament of the Interstate Association, under the auspices of the Meadville Gun Club. Chas. Stein, Sec'y.

July 14-15.—Poughkeepsie, N. Y.—Trophy shoot, Hudson River Trap-Shooters' League, on the grounds of the Poughkeepsie Gun Club. J. B. Rogers, Manager.

July 19-21.—Palmyra, Mo.—Eight annual tournament of the Missouri Amateur Shooting Association, under the management of the Palmyra Gun Club. Targets and live birds. Added money announced later. W. N. Bates, Sec'y.

July 27-28.—Meriden, Conn.—Tournament of the Interstate Association, under the auspices of the Parker Gun Club. C. S. Howard, Sec'y.

Aug. 10-11.—Marlborough, N. Y.—Trophy shoot, Hudson River Trap-Shooters' League, on grounds of Marlborough Gun Club. J. B. Rogers, Manager.

Aug. 17-18.—Waterville, Me.—Tournament of the Interstate Association, under the auspices of the Waterville Gun Club. E. T. Wyman, Sec'y.

Sept. 7-8.—Haverhill, Mass.—Tournament of the Interstate Association, under the auspices of the Haverhill Gun Club. Geo. F. Stevens, Sec'y.

DRIVERS AND TWISTERS.

The programme of the tournament of the Coeur d'Alene Rod and Gun Club, of Wallace, Idaho, is most attractively gotten up, and it offers greater attractions to shooters. It sets forth that the tournament is open to all amateur sportsmen of the Northwest, and that over \$600 in cash will be added. The club has arranged with the railroads for one fare and one-fifth, the purchaser of a ticket paying a full single fare and taking a receipt therefor from the agent. The secretary's signature on this receipt enables the holder to secure the one-fifth rate in returning. The bluerock part of the tournament will be held at the club's grounds on Nine Mile; the live-bird shooting at Osburn, three miles below Wallace. All shooting will be class shooting, 40, 30, 20 and 10 per cent., unless otherwise specified. All ties for cash prizes to be divided. Shooting will begin at 9 o'clock. The charge for bluerocks will be 5 cents each, and will be deducted from the purse. After the regular events have been shot on the 22d and 23d, sweepstake shooting will be in order, in which targets will be 3 cents. General averages will be computed from events 1 to 15 inclusive, and a shooter to be entitled to any average prize must have competed in all these events. On the first day there are eight events, of which five are at 20 targets, \$2.50 entrance, \$25 cash added to each, a total of \$125. There is also one 15-target event, \$2 entrance; one at 25 targets, \$3, \$50 added, and one three-man team shoot, 10 targets, \$4.50 entrance. In this event the captain of the team calls pull, when three traps are pulled simultaneously, and each shooter fires, and the result is scored accordingly to the team; both barrels are allowed. There are eight events on the second day, five of which are at 20 targets, same conditions as on the previous day, one at 15 targets; one three-man team shoot, \$9 per team, 25 targets, \$75 added; and one consolation shoot, 15 singles, \$2, \$50 added, open only to shooters whose average is 65 per cent. or under. There are two live-bird events on the third day, No. 1 being at 10 live birds, \$2.50, \$25 in cash added. No. 2 at 15 live birds, \$5, \$50 added. There are eight prizes for averages, ranging from \$26 to first to \$2.50 to eighth, a total in all of \$100.

In the general averages of the shooters at the Reading tournament we erroneously credited Charlie Grimm with an average of .848—that is, 437 broke out of 515 shot at, 20 less than his actual performance. It is quite painful enough to lose one target at a time, but to lose 20 in a block is something beyond words to compass. The score of Mr. Grimm was 457 breaks out of 515 shot at, which is .887 per cent., which would place him in the third place of general averages instead of the tenth.

Next week, on Wednesday, the Boiling Springs Gun Club's main event is the gold watch handicap, entrance price of targets.

BERNARD WATERS.

Notwithstanding that no announcement had been made in the sportsmen's journals, a very pleasant and successful little tournament was run off here yesterday. There was a nice little programme arranged, which consisted of ten 15-target events, while the inducements were \$50 added money (\$5 added in each event), 2-cent targets and a nice lunch at noon time. The shooters in the nearby cities were notified of the event, and some few were on hand. The Pine Bluff Club had a nice delegation of members present, namely, Dr. H. E. Williams, J. T. Lloyd, E. A. Howell and J. A. Coles. W. A. Leach came down from Fort Smith and John J. Sumpter, Jr., was over from Hot Springs. These, with the local shooters, made up a nice congenial crowd, which

Mercer 21, Rediter 22-129,
 Southwark Gun Club—McAfee 27, O'Brien 27, Ford 23, Burt 20,
 ed 24, Fisher 15-136.
 Norristown, Pa., April 9.—The Penn Gun Club, of this city,
 decided to withdraw from Philadelphia Trap-Shooters' League
 and to challenge Shuler Shooting Association, of Portland, and
 in City Club, of Royersford, to a series of club shoots.

WESTERN TRAPS.

CHICAGO CHALLENGE TROPHY.

CHICAGO, Ill., April 6.—To-day A. C. Paterson (Patti), the able-bodied hustler whose name appears regularly in the trap columns of *FOREST AND STREAM*, defeated a field of twenty-five Chicago cracks and carried off the beautiful emblem denoting the championship of this city at the live-bird traps. This was the initial event in the contests for this trophy, and was attended with interest by many lovers of the gun. The weather was good and the birds were good and strong, a keen wind aiding them nearly all the time. But two birds were flushed, and the sport was of so stiff a nature that one by one the best of the talent fell out. In the 20 hole E. S. Graham, Shepard and Airey still stood to win had they been able to finish straight, but one by one these lost even the shelter of their handicap, Shepard staying in last, but letting a fatal zero creep in too near the end. The husky man with whiskers kept on pushing his new Remington (a gun which he won as a second prize in the Cook County League handicap, and which he had never shot before this event) against the vanishing figures of Watson's ghostliest, and he went out with 25 killed out of his allowance of 26, remaining straight after missing his third bird. Tom Hicks was thought to be dangerous, and Billy Mussey for some time held the pace, but finally used up his chances. A number of good ones ceased to trouble after they had shot at the first block of 12, and some needed but a half dozen birds or so to convince them that they did not want the trophy this time. Thus Patti captured it in the first grand open shoot, and now wears it on his bosom, which is about 4 ft. across. I can only describe Mr. Paterson's victory as a triumph of good regular habits and the best of associations, which he has had in the course of his newspaper experience.

The weather to-day was bright but chilly, and a bit raw. The wind was puffy at times, and indeed came near to boxing the compass during the shoot. At first it blew in the direction of a left-quartering outgoer, then at about 3 P. M. it switched and blew nearly straight from the score, finishing by taking a course nearly straight across the score from left to right. A good little crowd watched the shoot. No fault was found with the handicap, which being double-barreled as it is, probably confused most of the shooters until they could not figure out whether they ought to holler or not. Anyhow no one did, and everybody was happy, the popular competition being very pleasantly inaugurated. Who will be the first man to challenge for the trophy remains to be seen. The formal challenge must be sent to the office of a local paper, and if the latter will consult the files of *FOREST AND STREAM* it may see a copy of the rules governing the contest. Mr. Shepard issued a verbal challenge, but first come first served, under the rules, and it is not yet known who will be first to comply with the conditions. I should think Patti ought to easily skin everybody that comes for about six times, and in such case we will hang the badge over the trap desk in this shop, where of course it belongs, since it was here that Mr. Paterson has received his training in shooting and literary matters. The badge looks very well hanging beneath his smile, but it would also look well hanging over a desk, and I would like to issue an informal ultimatum to the effect that the newspaper profession expects Mr. Paterson to do his duty. Following are the scores of to-day:

Trap score type—Copyright, 1898, by Forest and Stream Publishing Co.

ERB—NEAL.

Fred Erb, of Lafayette, Ind., was luckier with Elmer Neal than Eddie Bingham was, and succeeded in shooting him to a tie in the contest at Lafayette, April 4, for the Grand Hotel championship cup, emblematic of the target championship of Indiana. That is to say, the men were tied at the end of the 100 birds, each man breaking 88. In the shoot-off at 25, Neal scored 21 to the Hoosier's 24, leaving the cup with the latter. Mr. Neal now is classed as an Indiana man, but he learned how to shoot on the west side of Chicago, with the old Garfields, where he found plenty of good competition.

HON. TOM.

The Hon. Tom Marshall, of Keithsburg, has had a new honor added unto him. The shooters of his city have organized a gun club and called it "Tom A. Marshall Gun Club." The following officers have been elected: H. B. Hewitt, President; George F. Porter, Vice-President; Dave Adelsdorf, Treasurer; H. P. Humbert, Secretary. The executive committee consists of Hi Mikesell, Bart Humbert, B. C. Green and George Fleming.

I presume Tom will qualify as instructor-in-chief, and the club could have no better model.

FARGO OPENS SEASON.

"The Fargo Gun Club held the first shoot this year for its gold badge on Friday, April 1. The weather was chilly and prevented a good attendance.

"The event was 25 bluerocks from a magautrap. The scores are: Smith 15, Mack 23, Roberts 17, Guptill 17. Mack will wear the badge until the next shoot. The club shoots on Friday of each week for the badge. We use a dead bird allowance handicap. Mack, Sec'y."

THE KANSAS CITY TOURNAMENT.

CHICAGO, Ill., April 9.—The Missouri Fish and Game Protective Association, and the Federation of Gun Clubs, of Kansas City, held a joint business meeting this week and went into plans for the big tournament in May. Particulars in regard to this tournament are given briefly in the following letter from President Walden:

"Please be kind enough to say to your patrons in the trap-shooting world that our programme for our annual tournament in May will be distributed about the 20th inst., and it will certainly be a hummer. The added money in targets and live birds will be \$1,500, besides the \$1,000 guaranteed Star cup shoot, which bids fair to be one of the features of our tournament. Our live-bird programme will be very attractive to the lovers of this game; \$2.50 will be added to every pigeon shot at in all events. Our grounds have been enlarged and generally improved. Two sets of live-bird traps and two sets of magautraps will be provided and you can rest assured that the management will spare no pains or expense to make this the most attractive of any tournament ever held in the West."

This surely should be enticing to all who love a warm game at the traps. One of the features of the tournament will be the final shoot off for the Kansas City Star cup. Those now eligible to the final shoot are J. E. Riley and J. A. R. Elliott, of Kansas City; Sim Glover, of Rochester, N. Y.; and Fred Gilbert, of Spirit Lake, Ia. These four, with the winner of the open contest at the May shoot, will meet in a 25-bird race for the cup.

THE CHICAGO RACES.

Gilbert and Elliott are scheduled to meet at Watson's on Tuesday at 1 P. M., April 12, in their race for the Kansas City Star cup. Elliott has, however, written that this date will not be satisfactory to him, and at this writing it is still an open question whether the men will get together on Tuesday.

Gilbert and Parmelee are to meet in their contest for the Du Pont trophy at Watson's, 1 P. M. of Thursday. It is likely that the Omaha man will be on hand, and he is expected to put up a stiff race. With the Chicago challenge trophy shoot this week and two good races next week we are not altogether spoiling for excitement at the Chicago pigeon park.

I mentioned earlier the probable organization of a trap-shooting club in the membership of the Chicago Athletic Association. It is now stated that this project will in all probability now fall through for lack of interest.

SEATTLE WINS.

As is generally known, there is great public rivalry between the cities of Seattle and Tacoma, Wash., which rivalry extends even into trap-shooting matters. On March 27 these two cities held a team contest at the traps, five-men teams, 50 birds per man. Seattle won by a score of 206 to 200, as below. Tacoma has challenged back for the trophy representative of the championship, and the race will be shot April 24. Following are scores of race: Tacoma—Denham 34, Young 43, Kimball 37, Sheard 40, Peirce 45—200.

Seattle—Chellis 36, Norton 39, Ellis 43, Stevens 44, Hood 44—206. The new gun club of Keokuk, Ia., opened its season ceremonies last week.

ELGIN NATIONAL.

Elgin National Gun Club, of Elgin, Ill., issues a good little programme of its season contests for the Gold Dust cup, a silver loving cup presented by the Gold Dust Powder Co. The following are the rules and dates:

At 20 targets, five known traps, unknown angles. Best average of the six shoots to win the cup. Every contestant must shoot Gold Dust powder. A man absent at one shoot to be allowed to shoot his back score at the next monthly shoot. American Association rules to govern in any case not mentioned above.

Dates of the shoot will be April 23, May 28, June 25, July 23, Aug. 27, Sept. 24.

1206 BOYCE BUILDING, Chicago.

Chicago, April 9.—The Elgin National Gun Club, of Elgin, Ill., announces a summer contest at targets, under the head of Gold Dust cup shoot. The contest is to be held monthly on the fourth Saturday of each month, commencing April 23, and ending Sept. 24, 1898. Each contest will be at 25 targets, known traps, unknown angles, thrown from five traps, and will be open to all amateurs residing in Kane, Cook, De Kalb, Du Page, Lake or McHenry counties.

The cup will be awarded at the end of the series to the contestant having the highest average in the six contests. Any contestant will be allowed to shoot up one back score at any regular shoot in event of his absence from a previous shoot. The contestants for the cup are obliged to shoot Gold Dust powder in the cup event. American Shooting Association rules to govern. Sweepstakes will be shot before and after the cup shoot.

Moneys divided in events under twelve entries, 50, 30 and 20 per cent., and when over twelve entries 40, 30, 20 and 10 per cent.

Sweepstake shooting commences at 9 o'clock A. M.; cup shoot at 2 o'clock P. M. Shells and refreshments on the grounds.

EUREKA GUN CLUB.

The Eureka Gun Club, of Chicago, held its regular contest at targets on their grounds, corner Vincennes avenue and Seventy-ninth street, this afternoon. The early part of the day was very cloudy and accompanied with rain, which finally cleared up about noon. The light during the afternoon was anything but good for target shooting.

On account of the elements and the opening of the jack-snipe season the number present on the grounds was small.

Following are detailed scores in the trophy contest, classified, at 25 targets, known traps, unknown angles:

Class A.	
Hyde	011010111110111001101011—17
Hollister	111111111111001111101—22
Steck	111011011010010111111—19
Goodrich	111011011011111111101—20
Paterson	101111111110111111001—21
*Richards	01111101101100100110111—16
Class B.	
R. B. Carson	111100011111111011111—21
Kit	1111110110110110010101—18
Class C.	
A. C. Borroff	11101101101101011001101—18
Hollister won Class A. R. B. Carson won Class B. A. C. Borroff won Class C without opposition.	
* Visitor.	

Lincoln Gun Club.

The programme of the first annual amateur tournament of the Lincoln Gun Club, Lincoln, Neb., can be had on application to the secretary, Mr. George L. Carter, Box 338. April 19 to 21 inclusive are the dates. Two hundred and twenty-five dollars in cash will be added, and \$25 for high average. The club will also guarantee \$100 in a live-bird race. No bang, no bird, otherwise American Association rules govern. Professional shooters and manufacturers' agents are positively barred from shooting for purses, but they may shoot for the price of targets only. In target events there are five moneys, 30, 25, 20, 15 and 10. Targets will be thrown from two sets of traps, Sergeant system. Shooting commences at 8:30 each day. Shells sent care of Lincoln Hotel will be delivered on the grounds free of charge. There are ten target events on each day, the entrance, with two exceptions, being \$1.50 to each, with sums varying from \$5, \$7.50 to \$10 added. Open sweepstakes will be shot at the live-bird traps each day. On the second day event No. 10, the King's Smokeless event, is at 20 targets, \$2, in which event shooters must use King's Smokeless shells. Of the ten similar target events on the third day No. 5, the Gold Dust powder event, is at 20 targets, \$2, and therein shooters must use Gold Dust powder. The secretary will be pleased to answer all pertinent inquiries. He writes us that everything points now to one of the most successful meets of the West this season.

IN NEW JERSEY.

SOUTH RIVER GUN CLUB.

SOUTH RIVER, N. J., March 26.—At the R. R. R. Hotel a match for \$10 a side, 50 targets, American Association rules to govern, resulted as follows:

Booream, New Brunswick, N. J.	1011111011111111101010
J Belloff, New Brunswick, N. J.	0110111111111010110010—37
	11111110101010111010111
	111111111111011011101—40

Event No. 2: Match 25 targets \$5 a side:
D Hatter, South River

Event No. 3: Sweep, 10 targets; \$1 entrance; two moneys:
Bissett

Event No. 4: Sweep, 15 targets; \$1.50 entrance; two moneys; ties divided:
Bissett

Event No. 5: 25 targets; \$5 a side:
Booream

Event No. 6: Sweep; 5 targets, 50 cents each; two moneys; ties divided:
Bissett

The day was very rainy and windy, making the shooting very difficult, and kept the shooters away. There will be shooting at this place every two weeks—always on Saturdays, at targets—hereafter.

March 31.—No. 1 was at 15 live birds, one barrel, gun at the hip; \$15 a side, each to pay for his birds:

No. 1:
Bissett, South River

No. 2: \$1 miss-and-out:
Stoddard

No. 3: \$1 miss-and-out:
Woodruff

No. 4: \$3 entrance; 5 birds; handicap; all ties divided:
Belloff, 29

No. 5 was at 5 birds, \$3, handicap, all ties divided. No. 6 was at 10 birds, \$7, three moneys, all ties divided. No. 7 was a \$2 miss-and-out. No. 8 was a 10-bird match, \$10 a side:

No. 5. No. 6. No. 7.
Bissett, 28

No. 8:
Belloff

The birds were a very good lot. This is the first shoot at live birds on these grounds. The grounds are nicely arranged, in a very even field. There will be shoots held every other Wednesday at five birds.

TRAP AT ELLINGVILLE.
In the latter part of the past week members of the Jeannette Gun Club met on the grounds of the Columbia Fishing Club, Ellingville, Staten Island, in contests at live birds. The first event was a match at 25 birds:

H Pape, 28

J Hamhorst, 28

Team race: 25 birds each man:
C Meyer, 28

H Nobel, 28

N Brunie, 28

R Debachn, 28

Match at 10 birds:
Job Lott, 30

Bender, 30

There also was a 5-bird sweep, 21 entries, first money being divided between Job Lott, 30yds.; Brunie, 28; Carstens, 28; Rottman, 25; with straight scores.

BOILING SPRINGS GUN CLUB.

April 6.—The gold watch handicap, shot for on the first and third Wednesdays of March and April, 50 targets, handicap, Sergeant system, resulted as follows:
Greiff, 5

Palmer

Dutcher, 10

Spiegle, 9

Matzen, 18

Sweepstake events:
Events: 1 2 3 4 5 6 7 8 9 10

Targets: 10 10 10 10 10 10 10 10 10 10

Spiegle

Palmer

Greiff

Matzen

Dutcher

Morley

W. H. Huck.

KENESBERG GUN CLUB.

Kenesberg, N. J., April 4.—A large crowd witnessed the shooting at the Kenesberg Gun Club's grounds to-day. The birds were a choice and fast lot. Events Nos. 1, 2 and 3 were at 5 birds, \$3 entry, two moneys; No. 4 was miss-and-out, \$1 entry. Ties divided. The scores:

No. 1. No. 2. No. 3. No. 4.
Perrine

Compton

Bissett

Stoddard

Creighton

Oaks

Conover

Parker

Match, 10 birds, \$15 a side, loser paid for birds: Perrine 9, Bissett 7.

Match, 6 birds, \$5 a side: Bissett 4, Perrine 3.

GEO. W. SQUIER.

Mr. Edward Banks, at the shoot of the Brooklyn Gun Club last Saturday, struck a genuine war-horse gait, breaking 84 targets straight, missing his 85th. Continuing, he broke 126 out of 130. At one time it seemed as if breaking targets was an easy continuous performance. The true secret of it all is in pointing the breech in the correct line against the shoulder, whereupon the muzzle will take care of itself. Mr. Banks refused to go in the sweepstakes after the first one, thereby meriting the censure of all his fellow crackjacks in that, first, he was in a way establishing a bad precedent to the disfavor of professionalism, and, second, he permitted the semi-experts and ordinary performers to be in first moneys on scores of 88 and 98. Alas! we fear that the good old days are going, for it bodes ill for them when the epidermis of the amateur is stripable and is not stripped.

The Baltimore Tournament.

THE fifth annual tournament of the Baltimore Shooting Association, held on April 5 to 8, on the Association's grounds, on the Pimlico Road, was far from the success expected. As to the cause of the lack of support, it would be a difficult matter to determine beyond a doubt. Still there was a very strong suspicion that the number of manufacturers' agents who were present had much to do with the absence of the amateurs, or semi-experts. The latter-day amateur, he of the new school, has an abundance of the wisdom which enables him to discern when he has had enough. He doesn't want too much hopefulness as one part of the equation, and his dollars going out as the other part. Many systems, plausible in theory, but unavailing in practice, have been held forth, each with some special plea of beneficence and delectable opportunity in favor of the amateur. But one system has been found to work with any approach to equity to all concerned, and the very fact that it was the one which found disfavor with the professional was much toward proving that it was quite right for the trap-shooting interests at large. Nevertheless it has been rejected at times on the ground that there were those who objected to it.

The strong professional support given the Baltimore tournament was in part due to the manner in which the tournaments in the East, those worth the professional's attention, closed. The Reading tournament had a very strong professional attendance, which naturally went to Baltimore to attend that tournament before starting for the West, and in consequence an amateur stood about as much chance to win at Baltimore as he did at Reading, and a glance at the general averages of that tournament will show what the chance was. The amateur seemed to know it.

A high wind blew on every day, the weather being of the kind which does honor to March rather than to April. The first day was both stormy and windy, and there was a general falling off in scores. The great snowstorm which raged along the Atlantic coast did not spare Baltimore. A seat by the fire in the club house was far more to the liking of the shooters than was standing at the traps. The second day a strong raw wind blew from the northwest again, making most uncertain and irregular flights, besides drifting the shot at times to such an extent that it was most puzzling to determine the proper manner of holding the gun.

Some of the less expert shots entered for the targets only, at a rate of 3 cents per target. Some of the professionals protested strongly against this procedure, as by entering for targets only the poorer shots preserved their skins intact, which in a way impaired the ancient and vested rights of the professional as against the amateur, and deprived him of his just emoluments and honorariums. It was annoying to see the poor shooter enjoying himself, with his pockets sewed up as it were, and it was something not to be countenanced nor accepted.

Due objection was lodged with the management against the offenders, which was rather an unwise betrayal of the wolfish appetite, since it implied that if the poorer shots would not walk into the web voluntarily they must needs be brought in under pressure. It was further unwise in that such action tends more to bring the professionals into a distinct class by themselves, and will hasten their disbarment from all tournaments which depend on amateur support for their success. The objection was further badly taken even from a professional standpoint, as the poorer shot by paying 3 cents for targets was contributing to the added money which the regulars were raking in, so that the amateur was still a producer worthy of more than a passing notice, and surely too valuable to object to on the ground that he was not giving up all the money that he had. This brings to notice that the amateur is the man who pays for the added money as well as making the robust sweepstakes which he may gaze upon from afar. If he doesn't come in, his absence is severely felt, and then there is the sad, sad spectacle of wolf eat wolf, with the accompanying apologies which one wolf makes to another after he has eaten a part or all of him. It is not considered as being strictly professional for one wolf to eat another, but if there are no lambs then—look out, wolf!

The trend of trap-shooting interests has shown that the amateur will not patronize a tournament to any important extent when there are many professionals participating in it. The opportunity given the professional to display his goods and to shoot against all who enter against him is all that he can expect in the pursuit of his calling.

In the target events the moneys were divided in 40, 30, 20 and 10 per cent. There were so many good shots and the shooting was so difficult under the existing weather conditions that even if there had been six moneys, the poorer shot would not have been in it to any significant extent.

There was a great deal of dissatisfaction found with the targets, coast pigeons being used, although the programme stated that the events would all be on bluerocks. The complaint was that the coast pigeons did not break many times when hit lightly yet sufficiently hard to break them. Indeed there was an extraordinary number of dusted targets. They seemed to require very square hitting to break well.

The cashier's and scorer's departments were ably conducted by Mr. J. K. Starr, of Philadelphia.

TUESDAY, FIRST DAY.

A gale of wind and a snow storm out of season were weather conditions far from favorable for the comfort of the shooters or their best performance with the gun. The wind, blowing from the northwest, made freakish flights of the targets, and many a shot which was aimed aright failed because of the sudden rises, dips, curves, etc., which made the targets dodge the line of fire.

The amateur attendance was not equal to expectations. The bulk of the shooting was done by the regulars. The bad weather was a check on enthusiasm, and the warm stove in the club house was the chief rallying center throughout the day.

There were 10 target events, 20 targets, \$2. Each event was at known traps, unknown angles, except 5 and 10, which were expert rule, one man up. Purses in the target events were divided 40, 30, 20 and 10 per cent.

THE SCORES.

Events:	1	2	3	4	5	6	7	8	9	10	Shot	at. Broke.	Per Cent.
E Banks	16	18	17	13	12	13	16	16	14	12	200	147	.735

WEDNESDAY, SECOND DAY.

A strong northwest wind was blowing, which blew from the shooters to the traps. The sun shone bright, but there was a March rawness in the atmosphere which made the stove a favorite center of gathering. The percentages improved on this day, although the conditions were still very unfavorable for the best scores. Three extra sweeps were shot besides the regular events.

THE SCORES.

Boston Gun Club.

WELLINGTON, Mass.—With sixteen shooters on the grounds the Boston Gun Club found no trouble at all in flying 1,300 or 1,400 bird imitations between one and five o'clock, Wednesday, April 6. The beautiful afternoon proved an ally worth having, and though a nasty choppy wind was in evidence, yet some excellent scores were secured. The airy disturbance affected the doubles mostly, which was not to be wondered at. Doubles are here shot same rise as singles, in itself somewhat of a handicap. At 21, 18 and 16yds., with the wind raising Cain among the Keystone angles 2 and 3, 3 and 4, and 2 and 4; 50 per cent. and over is really very fair. Those present thought so, anyway, particularly after looking at the score sheet.

Centredale Gun Club.

CENTREDALE, R. I., April 2.—The scores of our opening shoot are given below. We threw about 3,300 targets from the magauprat, and it worked very satisfactorily. Beveridge broke 76½ per cent. Forehand 75; Jones 73 1-3; Walls 72; Hull 70½; Griffith 71; Greener 70; Arnold 67; Root 62½; and Moore 55. The above includes all the events, regular and practice.

The cracks were in the majority by a big margin, and included such men as Jack Hull, of Meriden, Conn.; C. E. Forehand, of Worcester; A. W. Walls, of the Sportsmen's Gun Club, Worcester; E. C. Griffiths, of Pascoag; H. H. Moore, F. L. Hammond and R. C. Root, who shot in the American Handicap; W. H. Sheldon, C. M. Staniels, Frank Arnold, S. D. Greene, Hugh Bain and C. C. Beveridge, the latter one of the crack shots of the Brooklyn Gun Club. Among the spectators were, besides the Secretary of State: Judge Albert L. Andrews, Henry C. Luther, Frank E. Comey, Dr. A. D. Rose and many other prominent men, the whole assemblage making up a concourse of genuine lovers of sport, by whom the events were contested and enjoyed heartily and without any friction or the least display of unfairness or "quitting," so obnoxious to the true sportsman.

An excellent quahaug chowder was one of the attractions, and the number of birds sprung was not far from 3,500, an enormous number, and far in excess of any like event in the annals of trap-shooting in this State. The weather after the first hour or two was bad, being cold and windy, but some excellent scores were made in spite of the gusty wind that blew across the range with the spitefulness of delayed March weather that was working overtime to catch up. The shoot was opened for practice about 10:30, and from that time until nearly 6 o'clock there was a constant fusillade of shots that sounded like miniature war to the villagers across the river. The real work began at 11:30, and the following events were contested by the shooters:

Events:	1	2	3	4	5	6	7	8	9	10
Targets:	15	20	20	15	10	15	25	20	20	14
Root.....	10	10	11	11	3	15	9	16	16	14

The prize shoot among club members was postponed until there shall be more time, and the novice shoot was won by Tate, with Tonge second and Isaac Angell third. The angles were all unknown.

Dansville Gun Club.

DANSVILLE, N. Y., April 1.—The Dansville Gun Club held its regular practice shoot to-day. Aside from a strong head wind blowing against the targets, making them very erratic in flight, the day was pleasant. The magauprat is growing in favor, and attracts considerable attention from shooters of other towns. The club's average was improved 3 per cent. over last week, as the following scores will show:

Events:	1	2	3	4	5	6	7	8	9	10	11
Targets:	10	15	10	15	10	10	10	10	10	10	10

WILLEY, Sec'y.

Audubon Gun Club.

BUFFALO, N. Y., April 2.—The scores made to-day are given below.

The new punch bowl emblematic of the city championship at live and artificial birds was brought forth from its case at the quarterly meeting of the Audubon Gun Club on the evening of April 2. The members did full justice to the occasion of the celebration of their triumph. In fact, the departure from custom found such favor with those present that there was not a dissenting voice when it was proposed to make it a permanent feature of meetings. E. C. Burkhardt and E. Reinecke generously volunteered to do the act at the next meeting.

Toasts were responded to by R. H. Hubbard, E. C. Burkhardt, L. W. Bennet, J. J. O'Brien, Arthur Coombs, C. S. Burkhardt and Dr. McMichael. J. J. Reid acted as toastmaster.

The members propose to establish the organization on a firmer basis than it has heretofore enjoyed. One of the principal features of the meeting was the appointment of a committee of three, E. C. Burkhardt chairman, R. H. Hebard and J. J. O'Brien, to select and buy suitable grounds for building a club house with the best conveniences for the members. They are to act and report immediately.

At the regular club shoot to-day the attendance was fair, considering the bad weather. Alex. Forrester carried off high-average honors in the target events, making 88 per cent. on the day's total, which was remarkably good shooting under the high wind and snow which prevailed.

In the badge shoot Norris and Forrester tied for A Class badge, and Forrester won in the shoot-off. In B class event George Zoeller and E. N. McCarney tied, Zoeller winning the shoot-off. Porter won C Class.

In event No. 7, at 7 live birds, E. N. McCarney and E. C. Burkhardt divided the purse with seven straight kills. Both did some excellent shooting, the birds being an extra swift lot, with a heavy wind to help them along. The score:

A. C. HEINOLD carried off high honors at the targets and E. C. Burkhardt, just back from the Baltimore shoot, and E. N. McCarney at live birds in the weekly shoot of the Audubon Gun Club on April 9.

The third event was the weekly badge shoot. Heindold won Class A badge, making a clean score of 25 straight, which was the third of the season of forty-two shoots. McCarney won Class B and J. J. Reid Class C badge. The last four events were at live birds. E. C. Burkhardt and McCarney beat out the field in these events, Burkhardt winning the first with 10 straight, and McCarney killing straight in the last three events.

Catchpole Gun Club.

WOLCOTT, N. Y., April 6.—The members of our club held their weekly shoot to-day over the new magauprat recently leased from the Cleveland Target Co. The scores are fair, taking into consideration that this was the first time that the club ever faced this new trap. Many shooters present never shot at targets from a trap of any kind before. To say that every member of our club was pleased with the magauprat does not express it. The shooting was difficult, owing to strong wind. Following is the score at 10-bird events:

FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

TERMS, \$1 A YEAR, 10 CTS. A COPY. }
SIX MONTHS, \$2. }

NEW YORK, SATURDAY, APRIL 23, 1898.

VOL. L.—No. 17.
No. 346 BROADWAY, NEW YORK.

PRACTICAL FISHING PAPERS.

THE chapters on fishing written by Mr. Fred Mather are intended to give practical instruction for beginners in the delightful art of angling. They are now dealing with trout. Others to follow will discuss black bass and other game fish.

Mr. George A. B. Dewar's description of dry fly fishing as practiced in Great Britain will excite lively interest in this country, where this mode of fishing is for the most part little more than a name. The use of the dry fly calls for the highest accomplishment in the angler's art. It combines the skill of fly-casting and rod handling with the patience and circumspection and perseverance of the still-hunter for deer.

Taken by and large the fishing columns of the FOREST AND STREAM contain a generous store of reading for those whose chosen recreation is with rod and line. During the months to come anglers will find in these pages a sustained interest.

SNAP SHOTS.

The St. Mary's Lake country, so long a portion of the Blackfeet Indian reservation, is such no longer. Tuesday, April 12, the mountain strip on the west side of the reservation, in which stand the Chief Mountain, Mts. Gould, Blackfoot and many other superb peaks, together with several great glaciers and the famed St. Mary's Lakes, was opened to occupancy and settlement under the mining laws of the United States. It had been expected that this opening would be an occasion of great excitement, but it's proved a very tame affair. Winter still holds its grip upon those rugged mountains, and the snow lies from 10 to 50 ft. deep over the ground that the miners and boomers intend to prospect, and then—to sell. It is not likely that the mineral wealth in these mountains will at all come up to the expectation of those who were so anxious to have the region opened to settlement, yet the irruption of prospectors cannot fail to have a disastrous effect on the game and the forests here. Both will be in a measure destroyed, and so one of the loveliest regions in America will lose a part of its charm. Yet not even the white man can level the mighty peaks which here seem to pierce the clouds, and the St. Mary's Lake country will long continue to attract the mountain climber. It is a region of surpassing natural beauty, and at some future day will become a great resort for travelers. But to some men—those who were among the first to penetrate to the heads of its narrow valleys and to scale its towering mountains—the opening of this region to the public and the building of trails and roads through its once lonely and silent fastnesses seems a desecration.

The New York Zoölogical Society has recently undertaken an inquiry into the extent and causes of the destruction of animal life in this country; and the result of the investigation is given in another column. Summed up in two words, the verdict is: Shot off. And the remedy suggested may be as briefly stated in the injunction: Stop shooting.

One chief factor not usually taken into account by students of the game supply is the growth of population. While the quail is a species which belongs with civilization, and of which the range has been extended by the settlement of the country, a reverse principle holds with other species. Man and brute may not possess the earth in common. The wild life must give way. The whole story of the game supply of the North American Continent may be read in the census returns of the population of the United States. In 1790 the total population was 3,929,214; in 1810 it was 7,239,881; in 1890 it was 62,622,250; and in 1900 it will be somewhere around 75,000,000. This means that the game, in one of the phrases of the time, must "get off the earth."

Game reduction and extermination—by game we mean all wild life—is moreover not distinctively a phenomenon confined to this continent. It is world-wide in extent. An English writer has just published a book dealing with lost and vanishing birds, in which he points out that a large percentage of the species which have

been obliterated from the British Isles could not have been preserved even under the favorable circumstances of the most elaborate means for their protection. They simply could not persist when brought into contact with civilization and the conditions attending it.

As in America and Europe, so too in Africa, that continent whose vast wildernesses were once thought to be game preserves of inexhaustible supply. Several species of African antelope are threatened with extinction, and sportsmen-naturalists are pleading for their immunity from further pursuit. This condition is due chiefly to the activity of the record maker, the hunter who shoots for "bag," and whose highest ambition it is to see his name above all the rest as a mighty slaughterer. The curse of killing for brag is upon the wilds of Africa, just as it is upon the prairies and the mountains, the marshes and the rivers of America.

The braggart hunter has been developed the world over; and he is everywhere the product of like conditions, which are those of a superabundance of game. Where the original indigenous supply is sufficient to withstand for a time the tax upon it, a growth of the practice of shooting for count is inevitable. When because of its abundance game is easily secured, no special credit is popularly attached to moderate bags; on the contrary, it is the big score that attracts attention, excites remark, and provokes emulation. Restriction, temperance and moderation are afterthoughts. They rise into the realm of recognized virtues only after a threatening diminution of the native store prompts men to say to themselves: "If these butchers kill so much of the game, there will be none left for us and for our children." Thereupon sentiment changes. Where before a big brag bag was envied, it is now condemned; and with an observance of the newly established code of ethics the sportsman ambitious to shine in the esteem of his fellows lays claim to the exercise of moderation as a field virtue. He recounts with pride not how he killed the last animal in sight, but how having taken his legal share he voluntarily let the rest escape.

The sway of sentiment controlling shooters in any given country at any given time, whether approving or disapproving big game scores, may thus correctly be predicated upon a knowledge of the condition of the game supply; and vice versa, if we know the sentiment concerning big scores, we may infer from this the condition of the game supply. If we hear deprecations of the killing of a long list of antelope in Africa we may know that African antelope are growing scarce. If the sentiment of sportsmen condemns the scoring of great bags of ducks or prairie chickens or quail in certain sections of our own country we may deduce from this a diminution of the native wild game to a point where one may no longer kill recklessly without regard to the rights and privileges of others and still presume to hold up his head as a decent member of society. In Great Britain and some other parts of the world, on the contrary, where battues are held on artificially reared pheasants, moderation based upon a regard for the conservation of the supply has no place in the code of shooting ethics; and so we hear heralded the record of Lord So-and-so's bag; and the bigger it is the more creditable an achievement it is held to be. In short, shooting prodigality is bred of abundance; moderation of scarcity. And the fact is that human nature being human nature the world over, realization of the necessity of moderation comes tardily. The stable door is locked after the horse has been stolen.

This rule that when the objects of pursuit grow scarce protection is demanded for them applies the world over, and extends to all wild animals which are pursued for sport. Thus we have the curious spectacle of certain species hunted from time immemorial as vermin and outlaws transformed into game animals and elevated to the rank of those deserving the protection of close seasons and restrictions as to modes of capture. Grizzly bears, alligators and tigers are now subjects of earnest discussion as to the ways and means of conserving the stock.

Once in the West a grizzly was looked upon as a foe to whom no quarter was to be shown; he was classed with the Great Adversary of mankind, and might be fought against and destroyed by any device fair or foul—

if indeed the idea of fairness could be entertained at all with respect to a grizzly. But within the last few years a sentiment has been growing up that the grizzly may be hunted only in a sportsmanlike way, according to rules and regulations laid down for the guidance of the craft.

So with the alligator in Florida. Twenty years ago he would have been laughed at who should have asked quarter for it; but to-day the people of the State who have seen the alligator practically exterminated from wide areas are beginning to think about restocking and protecting; and the wanton tourist rifleman who for so long was a disgrace and a curse of the State, with his alligator butchery, has been compelled by force of public opinion to curb his brutal propensities.

The advanced sportsmen of India are demanding that the immunity now enjoyed by the females and the young of animals counted in the sportsman's list shall be extended to tiger and bear cubs. The ground upon which this is urged is that same consideration of supply and demand which is calling for the protection of our grizzlies and alligators. It is to preserve the stock. From any other than the sportsman's standpoint the fewer the tigers and grizzlies in the world the better; the lay mind would regard their extermination with equanimity and gratitude. But the tiger hunter and grizzly hunter are not as other men; or to state the principle more accurately, they are precisely like others in demanding that their own interests shall be protected. To hunt the game they must have the game to hunt; and to have the game they must give it a chance to survive. If common sense provides seasons and modes of quail shooting, it is nothing else than common sense to adopt corresponding restrictions on the pursuit of bears and tigers.

If when you are strolling through the woods you come upon a spring and find there scattered about on the ground pieces of a cardboard box, egg shells, the bleached shells of lobster claws, a cork and pieces of string, these circumstances are taken as evidence that some one has eaten lunch there. If further on you come to a wire slip-noose attached to a bush, the noose encircling the neck of a ruffed grouse, with the skeleton and a few feathers still in place, this is circumstantial evidence that the grouse snarer has been there. Just such a relic of snaring was the skeleton which is pictured in our shooting columns to-day. It was found by the efficient detective employed by the Massachusetts Rod and Gun Club to break up the illicit business of snaring in the grouse covers of that Commonwealth. By the activity of the club's agent many miles of snares have been destroyed. This snare with its victim is one of the exhibits in the possession of Mr. Henry J. Thayer, the club secretary.

The Vermont Fish and Game League has a membership of over 550, distributed throughout the State; and it is building up a public sentiment which will make impossible a repetition of an experience related in the current League report as having happened in Essex county. Not many years ago a man was tried for killing a deer. The justice of the peace called the jury for a trial; there was no hotel in the place, and when the jury adjourned for dinner the men were distributed around the village. Two of the jurymen and the lawyer who defended dined with the respondent. They had venison for their dinner. After dinner the trial proceeded. At the close of the trial the jury announced that the man was not guilty.

The fourth chapter of Mr. Burnham's Yukon Notes is descriptive of the dogs used for packing, and it makes an exceedingly interesting story from start to finish. The presence of a trick poodle harnessed with a Newfoundland and in the intervals of his arduous task capering about and "doing his turn," as he may have gone through his part in some music hall, is suggestive of a veritable romance of dog life. What a story Ouida could make of it.

A few brief seasons ago there was universal complaint that the bluebird had disappeared from the land; and it was predicted that his epitaph was to be written. Then, after a season or two of scarcity, his grateful return was heralded, and to-day the bird is back in its old haunts and in the supply of former days. At best, while the people who are interested in birds are full of theories, the actual circumstances which control the supply are but imperfectly understood.

The Sportsman Tourist.

The Course of the Logs.

BY A. E. STEARNS.

"THE Connecticut River rises in the Connecticut lakes, flows in a southerly direction between Vermont and New Hampshire, then through Massachusetts and Connecticut, and empties into Long Island Sound." Such is the formula we learned as schoolboys from our geographies. To most of us the lower Connecticut is familiar enough, and perhaps not altogether attractive. But how many know anything about its source and its upper waters? I have lived for years near the old river; have floated on it; skated on it; fished on it; bathed in it; and enjoyed its beauty from the shore. But not until this last summer did I become acquainted with its birthplace. For years I had watched the logs floating silently by toward the fate that awaited them at some remote saw mill, and each year served to strengthen within me the desire to follow myself the wandering course of those logs. Finally the desire prompted to action, and on the first of August I set out with a friend for the northern corner of New Hampshire, where nestle the three Connecticut lakes, the sources of the river.

Of the country about the lakes little need be said. Civilization practically ends with the first and largest lake. Leaving this, the tourist plunges at once into the woods, which extend for miles north, east and west. About nine miles beyond First Lake we find Second Lake, somewhat smaller, but with wilder and more beautiful surroundings. Eight miles away lies Third Lake, the smallest, but most beautiful, of the three bodies of water. From the eastern shore of Second Lake an old trail strikes across to Rangeley, and no better description can be given of the Connecticut lake region than to say that it closely resembles that of the Rangeleys. Thickly wooded hills on all sides; the lakes nestling quietly at their feet; and numerous trout streams tumbling noisily down their sides.

We camped for two weeks on an inlet to Second Lake; fished and tramped to our heart's content; and then, having decided that we had become sufficiently well acquainted with the birthplace of the river, we packed up our goods and prepared to follow "the course of the logs."

Between the lakes the river is little more than a good-sized trout stream, and for about twenty miles below First Lake its channel is so wide and rocky as to render it altogether unsuitable for a canoe. So we decided to launch our cedar craft at West Stewartstown, and from there trust ourselves to the fortunes of the water.

Sunday morning, Aug. 22, found us ready to start. The day was all that could be desired, and as West Stewartstown offered few attractions for the Sabbath, we decided to drop down the river a few miles until we should come to a suitable place for dinner and our weekly "washing bee."

The canoe was heavily laden, and for the first half mile the water was shallow; but the channel soon deepened, and we glided along with nothing to disturb us. The scenery along this section of the river is attractive, but not wild enough to be ideal. Cultivated farm lands extend down to the banks on either side, while in the distance gently rising hills stretch away for miles.

Toward noon an attractive-looking sand beach came in sight. Directing our course toward it, we landed, and were soon in the water, forgetful of everything but the week's collection of soiled linen. In camp life what the weekly washing list lacks in size is more than offset by quality, and the river had speedily assumed a muddy hue. But the last garment was soon spread out on the neighboring bushes to dry, and after a final plunge in the river we fell to for dinner. Baked beans, bread and butter and coffee, our customary "quick lunch," furnished our repast, and then we stretched out under the shade of the bushes to enjoy a snooze. My companion was soon in dreamland, but while I was still in that drowsy transitional stage I heard a slight splash out in the water, and glancing out in the direction of the sound I saw a large muskrat making his way across the river. The rifle was near at hand, and the temptation to try a shot too strong to be resisted. Aiming directly over my companion's prostrate form, I fired. The aim was poor, and the animal disappeared with a splash; but the report of the rifle had given a new turn to the course of my companion's dreams. He jumped to his feet as though surrounded by Indians. "What was that?" he demanded, excitedly. I pointed to the widening circles on the surface of the water and explained the situation. He rubbed his eyes for a moment, grunted a few times as though disgusted with my levity, and was soon asleep again. At just this moment another muskrat, encouraged, no doubt, by the good fortune of his companion, and desirous of showing his contempt for me and my rifle, put out from the shore and started across the stream. That wouldn't go, and this time when the rifle cracked a kicking form remained on the surface of the stream.

"What in thunder are you trying to celebrate?" demanded the disturbed sleeper, as he again leaped to his feet.

"Same as before," I answered. "I don't intend to lie here and have those creatures dare me like that. I'll take a dare from some people, but not from a muskrat."

But sleeping time was now over. The washing was dry, and picking up our goods we started on down the river. Darkness had settled before we found an acceptable landing place for the night. Supper was cooked on the shore, and then striking back from the river for a few rods we came to a large pasture. A group of hemlock trees in the middle of it looked attractive, and we made for them. The place proved to be all we could desire, and while the bells were calling the good people of the neighboring town of Colebrook to evening worship we rolled up in our blankets and prepared for rest. Sleep soon had us in its embrace, and it was not until a flock of boisterous crows began their morning praise service over our heads that we regained consciousness. It proved to be almost 5 o'clock, and so we folded our blankets and started for the river. A good fire soon

drove the stiffness from our joints, and after a warm breakfast we were anxious to be off again.

Conditions favored us as we started on our second day's cruise. The light work of the previous day had left us free from blisters and lameness, and now with a clear sky overhead and swift water beneath us, we counted on making good headway. The country through which we were passing remained about the same as that of the day before, though occasionally a bend in the river would reveal the hazy outlines of the White Mountains, which promised us some glorious scenery in the near future.

As we paddled along the water grew swifter, and it became necessary to keep a sharp lookout for hidden rocks, for our canoe was none too light. Once we barely escaped a catastrophe. While bowling along through some swift water at a merry clip, our boat suddenly glided up on top of a submerged rock that threatened us with instant destruction; but by jumping overboard before the craft could swing around I managed to get her clear, and myself well soaked. But that was part of the programme. About noon a piece of water loomed up ahead that looked ominous. We landed and surveyed the course. We decided that a light canoe could easily run through, and as my companion expressed his willingness to sack some of the heaviest and most valuable articles along the shore, I agreed to pilot the boat through the objectionable stretch of water. The trip was soon completed, and at the end of the rough water we halted for dinner. Dainties from a nearby farmhouse helped to fill out our bill of fare, and after our customary loafing period, "to settle our dinner," we were again on our way.

It was nearly 4 o'clock when we reached a stretch of water called Lyman Falls, a place about which we had been cautioned by log drivers before starting on our trip. After a careful survey of the course the same scheme we had followed so successfully in the morning suggested itself, and we set out to carry it into execution. Allowing my companion to get a good start, I pushed off from the shore, and the canoe was soon tearing through the swift water at a lively pace. The situation was just beginning to grow enjoyable, when there came a sudden bump, and I found myself in the water with the canoe on top of me. Disentangling myself as best I could, I began a fierce conflict to save our half-submerged craft from being dashed to pieces on the rocks. The force of the water, its varying depths, and the uncertain footing I was able to secure, coupled with the weight of the boat, now filled with water, made my task a difficult one. But at last my efforts were rewarded, and I had the runaway craft wedged fast between two rocks where I knew it was safe for the time being at least. Then I started down the shore, hoping to overtake the fast disappearing goods that were tearing like mad down the stream. It was useless. They were traveling too fast for me, and all I could do now was to shout for my companion. He heard me, and dropping his pack, plunged into the river. But some of the articles had already sunk, and those that still floated were spread out over so wide a territory when they went by him that he could rescue little. The paddles, however, were saved, and we went back with a good deal of anxiety to examine into the condition of the canoe. Alas! one glance was enough to convince us that it must visit a repair shop. Our tent and all of our provisions had been washed away in the wreck, and it was evident that we must practically begin our trip over again. But just now it was necessary to get dry, and a huge fire was soon roaring on the shore. As we danced around the warm blaze in scanty attire, we discussed plans for the future. That we were in no condition to pass the night on the beach was evident. Shelter must be sought elsewhere.

Drawing on our still wet garments, we hid our goods in the bushes and climbed a steep bank behind us to explore the country. Fortune had not altogether deserted us. Near at hand were some farmhouses, and in one of these we were soon resting while our good host and his wife did all they could to make us comfortable. Our clothes were dried, our hungry stomachs satisfied, and then the guest room was placed at our disposal for the night.

When we appeared the next morning we found that our host had already inspected our battered craft and had arranged to carry it for us to the neighboring town of North Stratford, where we hoped to find the necessary repair shop. And so, having done justice to the good wife's breakfast, we climbed on to the old man's hay rack, and after loading the canoe jogged along to North Stratford. But here disappointment was in store for us. The necessary materials were not to be had in the town, and we were reluctantly compelled to ship the boat by freight to Wells River, the nearest town in which there was any prospect of our obtaining the desired results. Rain had begun to fall as we boarded the train for Wells River, and when we reached that town late in the evening we were thoroughly disgusted. To be sure we had not lost a great deal of the river trip, for between North Stratford and Wells River the greater part of the course is taken up with what is known as Fifteen Mile Falls, a long stretch of rapids, practically a continuous carry; and yet we were reluctant to lose even that part of the river, for the idea of resorting to a railroad was most repulsive to us.

Clear weather greeted us the next morning, and our spirits improved. As the boat had not yet arrived we spent the time laying in another stock of provisions for our now empty larder. During the afternoon the canoe arrived. In company with an assistant of the man who was to repair our craft I drove to the freight office. But we had no sooner loaded the thing on the wagon than the horse took fright, and making a sudden turn dumped the boat over the side and down a neighboring bank, where it lodged among the bushes. The horse was quieted, and after some little difficulty we once more had the canoe on the wagon. It did not rest easy, however, and I agreed to walk behind and steady it to prevent any undue straining. Again we started, and once more the horse began to show signs of fright. In his attempts to check him the driver suddenly found a broken rein in his hand, and now all he could do was to crouch in the bottom of the wagon and let the beast choose his own course and speed. The course suited

me all right, but the speed was growing too rapid. For a few yards I held on bravely, but as the frightened animal increased his stride I saw that I and the canoe were doomed. Still I raced madly on, horrible visions of a shattered boat and an inglorious railroad ride home rising before me. But the crisis came. A sudden lurch sent the canoe out into the road, while I sailed on over it and lit in a heap several yards beyond. As soon as I could regain my wind I pulled myself together and limped back to survey the wreck. In some miraculous way the boat had apparently escaped uninjured, and I sat down to wait for developments. The horse meanwhile had run all the way to the shop, a good mile away. Here a new rein was secured and the team returned for its load. I assured my friend that we would take no more chances, and though he remonstrated I compelled him to lead his steed by the bridle until we had reached our destination in safety.

Another morning dawned bright and clear, and after a little more tinkering the boat was ready to be launched again. We breathed a sigh of relief when a bend in the river hid from our view the smoke and dust of the town, and as the scenery had improved and the water favored us we gave ourselves up to the enjoyment of our surroundings.

A little below Wells River the current becomes sluggish, and for miles the river winds and twists in and out among broad farming lands, and progress is necessarily slow. At one time after paddling vigorously for several miles we found ourselves within quarter of a mile of a spot we had left long before. This was not encouraging, but as we had already lost valuable time we worked hard, determined to make up for the delay. Our noon stop was of short duration, allowing us just time for a cold lunch and a plunge in the river. Then we were off again, and when darkness came on we had left many miles of river behind us. The canoe glided into a little cove, and a fire was soon snapping at the top of the bank. The savory odors from our frying pan and coffee pot soon warned us that supper was ready, and we were not long stowing it away. The repast over, we turned in for the night under a clump of pine trees only a few rods away, and it again remained for our friends the crows to rouse us for the work of the next day.

We were late in getting started. In spite of careful repairs the canoe had leaked badly during the previous day, and we determined to remedy the defect if possible before proceeding, and so while I roasted over the coals of our morning fire a duck we had secured the day before my companion, armed with pitch and white lead, attacked the ship. When these important duties had been completed we were again ready to push on.

White River Junction was the town we had planned to reach that night, but we were doomed to disappointment. We had camped about two miles above Orford, N. H., and from this place to Orcut Falls, just above the junction, the river is wide and deep, with practically no current. To make our work harder a strong head wind sprung up, and the water became so rough that at times the waves almost submerged our low craft. At such times it was almost impossible to make any headway at all. As the daylight began to fade we were tired and out of sorts. Hanover was still a mile ahead of us, and between us and White River Junction lay about five miles of water and two carries, the one at Orcut Falls being the hardest of the entire trip. But complaining would do no good, and as the bank gave evidence of good camping grounds for the night we landed. Our disappointment had not taken the edge off of our appetites at any rate, and the way our supper disappeared was a caution. We had heaped our frying pan more than full with potatoes, bread, apples and "sand peeps"—"tip-up stew" we called the preparation—but when we had satisfied our hunger it was difficult to find even a bone. No wonder that we slept till late the next morning.

But we were already behind time and our breakfast was hurried. There was not a breath of wind stirring as we pushed off from the shore. The river was a huge mirror, and the reflections from Hanover to Orcut Falls were the most beautiful I have ever seen. The camera was brought into service, and snapped again and again. The results were in some cases gratifying, but none could begin to bring out the details or the coloring that gave to those reflections their wonderful beauty.

An hour's paddling brought us to the paper mills at Orcut Falls. As the canoe poked its way through the mass of chips, boards and logs that cover the river above the dam we began to realize that we had reached at last the most dreaded place of the entire trip. The carry here is a tough one. Up a steep, muddy bank, over a long stretch of rough ground, around the mills, and then at last down over a long, steep bank covered with a mass of broken rock and drift wood, until finally you reach a little cove, in which the canoe can once more ride safely on the water. Two hours were consumed here before we were once more on our way to the junction.

About half a mile below the falls is what is known to the logmen as the Lower Pitch, and here again we had to make a short carry. The river sweeps with great force through a narrow gap, and boils along for several rods in big choppy swells. But the carry is an easy one, and soon after 12 o'clock we paddled under the railroad bridge at White River Junction. Here we expected to find some mail waiting for us, and as it was already late we decided to purchase food for our dinner that would require no cooking. Leaving my companion in the canoe, I climbed the steep bank and made my way along the railroad tracks to the town. It was Fair Day, and the way the crowds stared at me was decidedly embarrassing. Evidently they took me for one of the freaks that form such an attractive element at the side shows of a typical county fair. My appearance would certainly have justified such a conclusion. My boots had assumed a color strangely like that of the river bottom, and were full of cracks; my stockings looked as though they had served as targets for our rifle and shotgun practice; my short trousers were adorned with everything from butter to coffee, while rents and tears were visible everywhere, some of the worst partly drawn together with the aid of pins and string, but most of them just as the bushes had left them. The sleeves of my dark blue flannel shirt had shrunk from continued

contact with the water until they barely covered my elbows, while the top button and its intended button-hole had agreed to separate until a good zin. intervened between them. This space was partly concealed by a gorgeous red and yellow and green tie, with which I had startled my companion while we were in Wells River. On my head I wore a battered cowboy's hat, with the tail feathers of a meat-hawk stuck jauntily in the band. A week's growth of beard completed my outfit. No wonder the people stared. But I survived the ordeal, and laden with letters and provisions made my way back to the river bank. The provisions were soon disposed of, the mail read and the canoe once more glided on down the river.

After the dirt and smoke and noise of White River Junction, the contrast afforded by the scenery we encountered between that town and Windsor is most refreshing. This stretch of the river is by far the most attractive one to be found between the lakes and Holyoke Dam. Thickly wooded hills shut the river in on all sides, and as the channel winds in and out among these it is often most difficult to tell where the stream is going to escape. The water too for the most part is swift, and we made good time. About 4 o'clock we reached the Queechi Falls, and here another carry was in order. The carry is a fairly long one, but the bank is free from obstructions, and our delay was of short duration. It was fast getting dark when we reached Windsor, and dropping down just below the town we landed. A short distance back from the river a steep hill rises abruptly, its top covered with trees and shrubs. Here in an old wood road we curled up in our blankets and were soon asleep.

"Wash day!" my companion sang out to me, as I opened my eyes the next morning. But breakfast was the first thing on the programme, and we set to work to prepare it. When our appetites had been appeased we dragged the canoe ashore, and dumping out its contents on the beach gave it the best scrubbing it had enjoyed for many a day. Then we set to work on our "linen." The list was a small one this week, and as the sun was most propitious we were soon on our way down the stream.

The water was still fairly swift, and we took things easy. But it seemed as though we never would lose sight of Windsor. For miles the channel holds almost a perfectly straight course, and it was well toward the noon hour when a bend in the river finally hid the town from our sight. A cool spring bubbling out from the bank offered us an attractive spot for lunch, and we made for it. Near by was a farmhouse, and while we munched our light repast the owner, a veteran of the late war, entertained us with thrilling accounts of his army life. Before we left him he had filled our pockets and every available space in our boat with the best apples his farm afforded, and as we paddled away he stood on the bank shouting after us his good wishes. There is no more hospitable or big-hearted man living than the average New England farmer.

The afternoon was quiet, the water without a ripple, and the woody banks were beautifully reflected in the river. It was an ideal time to be on the water. We had little inclination to work, and so stretching out on the bottom of the canoe we let her drift, and enjoyed to the full our inspiring surroundings. But as the afternoon wore away we realized that we must be on the lookout for our camping ground for the night. Paddling down below Charlestown, we guided our canoe into a small cove, and set out to find the place we desired. What seemed at the time an ideal place was discovered just back from the river, and our fire was soon blazing merrily. From our position among the trees we had a good view of the river in both directions. Just across the town of Charlestown lay spread out before us. On the opposite shore a party of young people were enjoying themselves to their hearts' content, and their babbling voices and shouts of laughter came floating over the water to us. But their merriment was interrupted by the approach of a boat which was coming up the river. Its occupant, a farmer's boy, had given himself up to the influence of his inspiring surroundings, and as he plied his oars was pouring forth his voice in a melody of song. His tones were unique, his range remarkable, and his selections included everything from "Hold the Fort" to "Swim out, O'Grady."

We ate our supper, puffed away on our pipes while the sparks from our camp-fire chased each other up through the pine branches toward the stars above us, and then as the blaze died down we drifted into sleep. But it was of short duration. An army of mosquitoes had discovered us and we were suddenly attacked from all sides. In vain we covered our heads with our coats, or buried them in our blankets; in vain did we shift from one position to another, and beat the atmosphere with our arms. We were outnumbered and defeated. Sullenly we crawled out of our blankets, started a fire, and lighting our pipes waited for morning.

We could leave that place none too soon that morning, and after some hard paddling—all the harder because of our unsatisfactory night—we reached Bellows Falls. Here a team was required to carry our boat around the falls. We were anxious to reach Brattleboro that night, and stopping only long enough to purchase a few provisions we pressed on. Below the falls the river again quickens its speed, and we traveled fast. But we still had many miles to cover to reach our destination before dark, and we worked hard, making only one short stop to allow ourselves a hasty lunch. Brattleboro was several miles away when daylight left us, but we determined to follow out our original plan, and so on we went. It was pitch dark when we came under Chesterfield Bridge, just above the town, and without any warning we suddenly found ourselves in a short stretch of swift, choppy water that almost swamped us. Luckily no rocks were in our pathway, and in a moment the threatening place had been left behind, and we breathed again.

At so late an hour it was useless to attempt to get a supper on shore, especially since our provisions were almost exhausted; and so hiding our canoe in the bushes we made our way to the town. To our surprise we found a hotel, where in spite of our tramp-like appearance we were given shelter for the night, and were not even asked to pay in advance. But a bed did not feel natural, and we made a poor night of it. A hotel

breakfast too did not seem to rest just right on our stomachs, but in spite of such drawbacks we started on for Turner's Falls in good spirits.

Just below Brattleboro Bridge we came through another stretch of choppy water, and for a number of miles a good stiff current carried us along at a lively pace. But early in the afternoon our work began. First the carry at the French King Rapids. Then a long stretch of dead water extending to the dam at Turner's Falls. About a mile above the dam a huge log jam completely blocked the river. But the lumber company has no legal right to impede navigation, and no objections were offered when we asked to have our canoe carried around the jam.

By the time we had secured a team to carry our boat around the falls it was dark, but no more hotel beds for us. When we found ourselves once more on the river bank we fell to work with a will, and soon had a tempting supper well under way. But it was too late to attempt to find an ideal camping ground, and we resolved to make the best of the first place that presented itself. Making our way through a thick clump of alders we emerged into an open pasture. Here, under a tall elm tree, while the frogs sang their prettiest to us, and the stars watched over us, we stretched out our blankets and forgot the world and its cares.

The next day was to complete our journey. Our friends at home had learned of our whereabouts and had planned to meet us just above Sunderland Bridge and celebrate our return to civilization with an old-fashioned picnic. We were the first to reach the spot, but the others were not long in appearing, and soon after the noon hour we were making huge inroads into the choicest dishes from our home larders. As evening drew near we left our friends to pack up the remnants of that glorious repast, and embarking for the last time in our canoe paddled the remaining few miles to Northampton. A team was waiting to carry us and our outfit to our home, and reluctantly we turned our back upon the old river that had furnished us so much solid enjoyment.

To a man seeking merely adventure and excitement the trip I have described would offer few attractions. But sometimes we crave outings of a different sort. Surely to one who enjoys nature, who appreciates the restfulness that comes from floating on the waters of an attractive river, and who derives any satisfaction from investigating the history of its wanderings, a trip down the Connecticut is well worth trying. The expense is slight; the river has waters of all kinds, from long calm stretches to foaming rapids, and along its banks is some of the finest of New England scenery. There are times too when we have neither the time nor money to shoot Canadian rapids, and at such times it often happens that the enjoyment and recreation we seek lie close at our doors, unappreciated by us because of their very nearness.

ANDOVER, MASS.

The Island of Marquez.

An account of the first expedition to California, compiled from original sources for children of all ages.

It is not generally known that the first white men to set foot within the boundaries of the present State of California formed a detachment sent out by the famous explorer Coronado.

The ultimate limit of Coronado's own journey was a country called Quivira, which, we know from the accounts of his march which have reached us, lay near the Missouri River, probably in eastern Kansas; yet if you look at the old maps of America dating even as late as fifty years after this great march you will find a country labeled Quivira built out a long way into the Pacific Ocean west of San Francisco and sometimes overlapping the longitude of New Guinea.

It will not therefore surprise us much, in view of the prevailing confusion of directions, to find that the detachment whose fortunes we are about to follow was sent westward to communicate with certain ships despatched to assist Coronado—ships that could only have reached him by passing eastward over a thousand miles of dry land.

First let us look at the origin of the main expedition and then the whole sequence of events will become clear.

Through all the earlier part of the sixteenth century the hardy soldiery of Spain, stirred by an immense impulse of hope, energy and enthusiasm, had performed wonders of discovery.

It was in the month of February, 1540, that the stalwart Capt. Francisco Coronado, emulous of other pioneers, led his forces out of the valley of Mexico. He was full of eagerness to realize a prospect of almost certain and enormous riches and renown. Reports had come to the capital from venturesome sailors of gold and pearls in lands still undiscovered. Friendly Indians had told splendid tales of the rich shores of the sea of Cortez. Why should not the upper country hold wealth such as Don Pedro de Alvarado had wrung from his southern provinces? And why should "old Christians" be frightened at stories of man-eating savages or sea serpents that served the demon?

Years before, the viceroy Guzman had planned to conquer the seven golden cities of Cibola, but his Indian guide had died and no one could tell the way to that mysterious land. Then three soldiers came to Mexico who had formed part of the band that Narvaez took to explore Florida. For eight years these sole survivors of that gallant host had borne the buffets of ill-fortune, shipwreck, slavery and weary journeyings, till from tribe to tribe and from village to village they had crossed the continent and stood before the great viceroy Mendoza, Guzman's famous successor. Dorantes, Maldonado and Cabeza de Vaca had passed from Alabama westward through Arizona to the Pacific nearly three hundred years before Lewis and Clarke sailed down the Columbia; fifty years and more before Philip launched his great Armada against undaunted England. These were the pathfinders of that golden age, and you must hunt in musty records to find their names. Yet if they suffered poverty and toil, if their memory is covered deep with the dust of oblivion, truly they had their reward—the joy of vast discovery of things unknown. So Mendoza heard the wanderers' tale and summoned Francisco Coronado, the governor of New Galicia (who should not be

confounded with his kinsman, Juan Coronado), and giving him three hundred Spaniards, many of them veterans and many of gentle blood, besides a body of Indian auxiliaries, dispatched him to conquer new lands. The Spanish soldiers were sent off separately to meet the native levies many leagues to the northward, lest before they became inured to discipline they should brawl with the Indian allies. So the whole army was gathered at Compostela and reviewed by the viceroy, who then turned back to the capital, while the expedition began its toilsome march.

The road lay over rough and mountainous country for a long distance. Traveling was difficult at best, and the hardship was increased by the loss of a large portion of the scanty baggage. Over the narrow and rocky trails only pack horses could be used for burden, and few of the soldiers and none of the gentry had ever packed an animal in their lives or knew even the rudiments of the necessary art of packing.

Now at Chiametla, some twenty-five leagues on the way, the army met Melchior Diaz, a seasoned explorer, who had been sent ahead with a few men to scout the country. Melchior reported that he had gone north near three hundred leagues of actual travel and over two hundred in a straight line as far as Chilchitcale, the place now known as Casa Grande in Arizona, but that he had seen no inhabited city, for though Chilchitcale was a vast adobe building, no doubt once both dwelling and fortress of a vanquished tribe, it stood then as now roofless and fire-blackened, a monument of the ferocity of the savage nomads of the surrounding deserts.

We need not follow this expedition of romance step by step—how they conquered or visited the Zuñi and Moqui towns and Queres and Taos and Acoma; how one detachment peered into and climbed part way down the grand cañon of the Colorado and another almost reached the banks of the father of waters, and how they returned richer in wisdom than in gold to the astonished and indignant viceroy.

Let us go back to Melchior Diaz, whom we find in September at the town of Sonora (now Hermosillo) preparing to lead a band of twenty-five men in search of the ships of Alarcon. For this seaman had been despatched laden with supplies for the army under orders "to pass the straits that separated the island of Marquez (called by some the island of California) from the mainland, and coast along the shores of the southern sea as far north as the 36th degree of north latitude, keeping in touch with the land force under Coronado—yet not to pass so far north as to reach the Great India claimed by the Portuguese, which touches this country on the northwest."

From these orders it will be seen that the viceroy's ideas of the lay of the land much needed that very correction which his adventurous explorers would soon give.

Many of the details of the doings of Coronado, Diaz and Alarcon have been given in the Spanish official reports, but these are accessible mainly through French translations, which omit circumstances deemed by the translators to be little worthy of credence or attention; and the original "relaciones" of Castañeda and Jaramillo contain much of interest and importance not to be found in the French editions. Besides these official reports there is a manuscript, old indeed, but unfortunately not quite contemporary with the events related, which purports to be written by a son of Tomas Martinez, who was one of Diaz's followers, at his father's dictation. This document is in the custody of Don Juan Martinez, living now or lately in the town of Altar, Sonora, Mexico, and contains a few intimate details either not given in, or differing from, the official accounts. Yet, as the official accounts themselves are occasionally at variance while obviously true in their general purport, it seems as if the Martinez manuscript were worthy of the same regard as they.*

In September of 1540 Melchior Diaz left Hermosillo for the Western coast. He had under him twenty-four fighting men, and a Franciscan priest, Father Jayme, accompanied the party. The soldiers were in the main old campaigners, ready for adventure and danger, but with a practical eye to the advantages of wealth and some experience in getting profitable work out of the Indians of the Mexican provinces.

Besides the Tomas Martinez already mentioned there was an Andalusian, Pedro Estrada, of dark color and perhaps some Moorish ancestry, who acted as a kind of informal lieutenant for Diaz, and two young Castilians, Bejar and Sainz. All of the party were at first mounted and these two Castilians were accompanied by two greyhounds, meant for coursing game, but much more apt to worry the sheep which the prudent captain had collected and was driving with his column to supply their needs in case other provisions fell short.

The detachment marched first down the Sonora River, which toward the coast dwindles to a dry sandy bed, and then, when in sight of the sea, the party turned north through the rocky and desolate region that lies along the coast. Several horses were lost here through thirst and starvation, and the men had hard work to get water enough to keep them alive from the few and bitter springs that were found. By chance one day they came upon a party of Seris Indians, who were so surprised by the appearance that they supposed the mounted Spaniards were creatures of another world and readily guided them to a water hole, when their wants were made known by signs. The natural ferocity of these savages, however, which does not even respect the supernatural, prompted them, after their first alarm was passed, to attack the Castilian Bejar, who was separated somewhat from the rest, little suspecting such a danger, and would have been killed but for his dog, which fell a sacrifice to his devotion to his master. The Spaniards to be sure promptly assailed the Indians and killed three of them, but the incredible swiftness of the survivors enabled them

* Note by the Editor.—The manuscript of the Island of Marquez was received from our correspondent Mr. Dulog something more than a year ago. Since that time the Bureau of Ethnology has published the original texts of some of the documents here named, including the report of Coronado and the relation of Castañeda, together with translations. In these accounts there is frequent reference to the journey given us by Mr. Dulog from the Martinez manuscript.

The details here given form an interesting contribution to the history of early discovery in America.

to outstrip, without apparent effort, even the fastest of the lean horses of the whites.

Northward the column plodded for some three weeks, at times catching glimpses across the western water of the blue peaks of the mountains of the island of Marquez, or of California, as they variously called it, and suffering some loss of horses, while the flock of sheep dwindled fast, and the now lonely dog had to be kept in leash lest he should race them to death.

Diaz now decided to stop and rest his company for a week. His march had been kept down to the pace of the traveling sheep, and he had made in this time little more than two hundred miles, but he went into camp on the bank of a pool, which formed part of one of those disappearing and reappearing streams so common in the arid West. This theoretical stream was called by the Spaniards somewhat pompously the San Ygnacio River. The grass, springing after the July rains, was now strong and succulent. The horses and sheep picked up wonderfully and the men managed to capture several antelope, which proved to be excellent eating. Starting again northward and afterward westward, Diaz at last reached the Colorado River about the first of November. He called the river the Tizon (or "burnt wood") River for some unknown reason, and was much struck by its size. Moreover, he began now to have misgivings about the viceroy's geography, and found that his own map was certainly unreliable.

Still he pressed on up the river along the east bank, and was finally met by news of Alarcon's ships. He interpreted the information, much of which was given by signs to mean that the ships were on the sea coast at the mouth of the river, as indeed they had been a month before. But, while yet a good way above the river's mouth, a tree was found on the bank with a great fresh blaze on the side, and on the blaze was written by the point of a hot iron: "Alarcon has come thus far; dig at the foot of this tree for letters." The letters were found in a wooden box and told that the hardy and intelligent sailor had been up the river with his men a long way in rowboats, but had found that it would be impossible to communicate with Coronado by this route. He also said that no further advance by sea was possible because the sea was a gulf and that the ocean did not flow in around the north of the island of Marquez or California, but that that supposed island was a part of the land forming the gulf. Alarcon therefore, after doing and finding out everything possible, had sailed back. Diaz now consulted with his men about their future plan of action. They decided first to march up the river until they might find some good place to camp for a few days and either fell timber for raft-building or capture Indian boats, if they should be found, to ferry them across the stream; then to visit the new regions beyond. For they had heard much of the pearls of the island of Marquez, and seen some fine jewels from those parts, and if Alarcon was right the Marquez land was no island, but could be reached on foot by crossing the stream before them, unless indeed some "mountains of fire" laid down indistinctly on the map should bar the way. One obstacle, however, to rapid journeys and easy subsistence was the determined hostility of the natives. Further south in Anáhuac, in Culiacan, even in Sonora, the Indians, who formed large and partly civilized bodies, were brave to be sure, and fought well against invasion, but after Spanish steel and Spanish powder had won a few engagements the natives for the most part submitted to Christian rule. Here, however, from the Seris onward, the miserable unsocial wanderers seemed animated by no motive but hatred of their kind. They lived on food often of surprising and disgusting character: spiders, insects, decaying meat, cooked or raw, all seemed palatable to these creatures. Their dress was but a ragged hide or loin cloth of woven grass. Their hair, matted with dirt, was the only protection for their heads. Yet, with all this, their endurance and swiftness were the marvel of the strong and hardy soldiers. Lurking behind some rock or cactus clump for hours or even days, they would fire their arrows and speed away laughing at the futile pursuit. Fortunately their bows were weak, and their aim, except at close distances, was poor, so that as the wary captain was always on his guard, the band thus far had suffered only from a few slight wounds and the necessity of a constant watch.

Diaz then starting his men up the river in the cool weather of the late autumn, kept near enough the stream to feed his animals on the green grass of the bottoms. Scouts could examine the level desert or the low stony hills with little trouble, and while occasionally the march was stopped at the sight of hostile natives sneaking in the neighborhood, the sheep were the main hindrance to speed. The flock, however, had proved indispensable and had fed the men for many days when the wilderness offered them no resources.

A little over a week's march (during which the party must have crossed the Gila River, though none of the reports mentions that fact) brought the explorers about a hundred miles above the point where they had found Alarcon's letter. Now they spied half a dozen of the brush-wood huts that the Indians live in, and a few of those platforms with huge baskets on them which the squaws used for the storage of the wild seeds they collected. The inhabitants of this village did not exactly defend their settlement, but lurked in the neighborhood and managed to wound both a man and a horse before a volley from the matchlocks, which were carried by a part of the Spanish force, scared them off to a respectful distance. Diaz found here a canoe, but his men did not manage it well. It was a small craft at best and so cranky that the two soldiers who tried it turned over with it after a dozen strokes.

The men were in shallow water, and waded out, but they neglected the boat, which floated down stream. No effort in fact was made to find the canoe, for Diaz thought it would be better to build a raft out of a group of cottonwoods which grew in a bend of the river.

The green trees were cut and proved to be so heavy as almost to sink in the water without a load, but some old windfalls lay amid the standing timber and by choosing those which were dry but not yet decayed a raft was made, lashed together with ropes. The raft could carry eight or nine men and their baggage. The horses were towed behind, either wading in the shallows or swimming in the deeper current, and the sheep were tied

and laid on the raft among the men, a few going over each time. A great part of the crossing could be made by poling the raft, and the main trouble then was to keep off the sand banks. Then when they drew near the channel, the raft was pushed along fast, and if there were a favoring breeze blankets were held up to give headway. It took, however, five trips, and two whole days were used up in ferrying, for some of the men had to go back each time with the raft, and at every crossing the current swept the clumsy contrivance far down stream, so that when the whole party were over they found themselves ten miles below their first starting point.

On Sunday, Nov. 21, old style—for the year, you remember, was 1540—the crossing was finished, the sheep, the dog, the surviving horses and the baggage were all safely over, and Father Jayme reverently laid on the ground the small consecrated stone he always carried to sanctify his rustic altars and celebrated mass, while the Spaniards knelt and a few Indians, less ferocious seemingly than their kinsmen across the river, gazed in wonder at the strange company with their stranger animals, their glittering arms and their impressive rites.

But these solemn rejoicings were followed by a stroke of fate which cost the expedition its loved and revered leader and sent most of the soldiers on a long retreat.

About a week after the party had started south along the west bank of the river the dog of Sainz was trotting along with the column when something frightened the sheep. There is no animal probably so stupid even to the point of suicide as a sheep. The flock was crowding over toward a steep ravine and Sainz ran to head them off. His greyhound, which was ill-mannered and untrained, straightway bounded after the sheep and was like to have bitten some and chased others to their death. Diaz, whose patience had already been tried by the antics of the dog, spurred his horse to a fast gallop and hurled his lance with a speed and aim which would have pinned the hound to the ground, but for the fact that the spear glanced on the branch of a mesquite tree and turned over and over, finally sticking into the ground with butt down and point raking backward. All this passed so quickly that Diaz did not notice his spear among the bushes until he was close on to it, and then his hard-mouthed horse did not turn quickly enough to save him. The spear point pierced the thigh and ran crosswise some zin. into the body of the rider. Courageous to the last, Diaz at once had the weapon pulled out, and though faint from the shock and bleeding directed his men to make a litter and bear him on to the next water. For two days they lay encamped at a scanty spring with little shade, when it became clear that Diaz's wound would probably prove fatal. He himself urged the whole party to go forward, carrying him while he lived, and after he died taking possession of new lands for the Catholic king. The soldiers were too cast down to care now for adventure, and the Indians, perceiving that some evil fortune had befallen the Spaniards, harassed them exceedingly. By slow marches the party withdrew to the great river, and there in the cool shade they nursed their captain for several days longer until his strong and gallant spirit took its flight.

To the last Diaz had urged priest and soldiers to further efforts, showing them the duty of a true Spaniard to his king and a true apostle to his church, and finally died bravely and quietly, having partaken of the holy sacrament.

The men sorrowfully buried their commander, and then consulted as to their future course. Father Jayme was filled with missionary spirit, and eager to follow the promptings of his own heart and that of his beloved captain. Estrada too was for going forward, and of that counsel were Martinez and Bejar, but Sainz was overcome with grief that his dog had caused so great a disaster and wished to go back, and all the others except the four named agreed with Sainz. So, in great friendship, the band decided to separate. And it is remarkable to see how few disputes arose, even after the loss of the strong and gentle hand which had trained the band to feel as one man. Sainz led back his twenty men to the land of the Pimas and Papagos, who were found to be much more tractable than the Indians of the river, and by the help of these natives they managed to collect quite a little gold dust from the placers of northern Sonora, and late in the winter returned to Culiacan.

Estrada, Bejar, Martinez and Father Jayme mounted their horses, for four horses of those remaining had been allotted to these explorers, and again started to the southwest to reach the land of the Cocopahs, who were said to be more gentle or at least less ferocious than the river tribes.

Father Jayme grieved exceedingly that of all the heathen he had met on the journey, one only had he baptized, and that one was a wounded man, who tried to stab the priest during the holy office, so that it was doubtful whether the power of grace had taken effect even in this instance. He thought, however, that perhaps the natives further south would be persuaded of the truth like the tribes of Anáhuac, and he hoped strongly to save many. The natives near by, however, were so hostile that the party started at night, and by a long march got a safe lead on their enemies. One boy only was seen dogging them the next day, skimming swiftly with bare feet over sharp flints and cactus thorns, of which even the protected Spaniards were wary. It is indeed uncertain whether the youth was really an enemy or only a hostage from the southern tribes held by the river Indians, who was anxious to join the soldiers on their march, but afraid to do so. Estrada laid a cunning trap for him. The party on passing over a sharp rise in the ground saw a gully twisting down to the left. Estrada jumped off his horse and hid behind a rock, telling the rest to hasten forward, so that only a part of them could be seen at a time in the twists and turns of the ravine. The simple plan worked perfectly. The pursuer came rapidly along, scanning the tracks and glancing now and then at the distant band. On a sudden, Estrada caught him with a strong grip on both arms and raised a great shout. The companions then came back and secured the captive with a rope, when they again took up their journey. The prisoner after the first start of surprised terror had seemed resigned. His stolid and dirty features looked as if they were trying to express wonder and admiration at the bearded whites and their strange animals.

Father Jayme was delighted. That evening in camp

he strove earnestly to exorcise the demon which evidently lurked behind the grim visage of the youth by certain Latin prayers. From the accounts of the soldier chroniclers it can be seen that Father Jayme was somewhat of a classical scholar, and not a little proud of his learning. When the writers speak of him as using the words of the vulgate or the service, this Latin, familiar to all good churchmen, is often recognizable (indeed it is sometimes a surprise on looking up some deplorable Latin to find that it gives the exact words of the vulgate), but at times the renderings of the good priest's learned words became a riddle after filtering through the untaught memories of his ruder friends. This is especially true of Martinez, who seems to have been less cultivated than either Jaramillo or Castañeda, the historians, who wrote also about the fortunes of other parts of the expedition, and indeed it is not certain whether Martinez himself could write at all.

The ceremony of casting the devil out of the captive began with the words, "In nomine patris conjuro te O! Satanas." The rest of the address cannot now be restored from the confusion of tongues into which it has fallen, but the prisoner himself, in spite of his forbidding appearance, seems to have desired to stand well with his captors. He submitted to an aspersion of holy water, and was grateful when the good father undid his bonds and wound a cloth around a ragged cut in his arm, which he seemed to have got by some fall or accident during the night. The good father was now assured that he had gained a convert, and only waited for a more complete understanding of the signs or words of the neophyte to baptize him.

Provisionally he was called Juan, as none of the party could pronounce those singular sounds he used, apparently to tell his name, and as a measure of precaution Estrada took his bow.

H. G. DULOG.

[TO BE CONTINUED.]

John Clough's Ride.

CURRITUCK, N. C.—This season, which closed March 31, was equal to any during the past ten years; and the snipe season just beginning bids fair to be a good one also.

There has been much speculation among the natives, as well as visitors, during the past year or two as to what the future holds in store for us. If the water continues to grow salt, as it has done for the past two years, there is no question that the canvasbacks, red-heads and ruddy ducks will leave us. About sixty-five years ago, when old Currituck Inlet was open, we are told by some of our oldest friends that while there was an abundance of black brant, sea coots, old squaws and other kinds of salt-water ducks, with an occasional flock of wild geese, there were none, or scarcely any, of the other varieties we now prize so much. There are many reasons for the water changing from fresh to salt, but the principal one is that the beach lying between the Sound and Atlantic Ocean, which is only from a half mile to one and a quarter miles wide, seems slowly but constantly washing away. Every fall and spring when the equinoctial comes the storm tides come across into the Sound and leave the water for months almost as salt as the ocean itself. Whether these storms grow worse we are not sure, but certain it is that every season more and more salt water comes across, leaving the beach more level and less able to prevent it.

In my own opinion, in less than a quarter of a century the whole beach from Back Bay in Virginia to Roanoke Island, N. C., will be simply a reef out in the sea. As an example we would direct the reader to Cobb's Island, off the Virginia coast. Five years ago it was a large island, hundreds of acres in extent, with a large hotel on it. Last fall a heavy storm came, and to-day there is simply a reef out in the ocean.

It has been our lot to be caught on the coast in some of these storms. The experiences were wild and weird, and never to be forgotten.

Sunday morning, March 16, 1846, John Dyer, of Princess Anne, about nine miles south of Virginia Beach, was aroused from his slumber and told he must prepare to vacate, and that he would probably have to swim for his life. It so happened that John had been careless with his gun some weeks before, and had shot a part of his right leg off. William Clough, his wife and three children occupied this one-story (16 by 20) building with John, but they had only one small skiff between them, which barely held William and his little family. William quickly placed them in the boat and pushed off, promising to return for John and his stiff leg as soon as he found land; but alas! he found no land, or at least no olive branches, and never returned. By this time the wind had increased to a hurricane, and the breakers were tumbling over the beach 10 to 15 ft. high. Now John had been placed, when wounded, on an old-fashioned high-post feather bed, in which there were solbs. of wild goose feathers. The house began to rock like a cradle, and John to pray; still William, his only hope, came not. It was awful. The water began to come in through the door and run across the floor; still no William. The cat, the only living creature left save John, jumped on the bed, and at this moment the roof parted and blew over; then came an immense wave, and away they went, floating away on the crest of the huge billow. The top part of the house had been used for a smoke-house, and as luck would have it, when the house fell a large ham fell on the bed with him. For hours he drifted before the wind and tide, flat on his back, on this "downy couch," with no hope of being saved. All that afternoon and far into the inky night he drifted on; finally, worn out from exposure, he fell asleep and slumbered on. There are no mountains in that section, but three days later John was found in the top of a live oak tree, about 12 ft. from the ground, still sticking to the old feather bed, with the cat for a companion quietly sleeping by his side. This is a true story.

CURRITUCK.

The FOREST AND STREAM is put to press each week on Tuesday. Correspondence intended for publication should reach us at the latest by Monday, and as much earlier as practicable.

Natural History.

Fox Squirrels in a City Square.

PASSING daily through the court house square of this city to and from my work, I have perforce become an interested spectator of the ways and habits of a number of fox squirrels, who make this their stamping ground. In the midst of business blocks and the teeming crowd one may well view the untamed nature and unconventional life of these wood creatures with considerable exhilaration and freshness. Fringed by a row of elms and soft maples, with other forest growth here and there, the square presents a scene seemingly as satisfactory to the squirrels as their native oak openings, although the absence of nut-bearing trees must necessarily be deplored for their sake.

Originally a dozen or more of these fox squirrels were introduced in the little park some years ago by a county official, and precautions were taken to supply their every demand and creature comfort. Boxes and cages were placed conveniently in the trees, and of nuts there was always a liberal supply. They were soon acclimatized to their surroundings, and their happy ways were a source of much delight and amusement to the loungers and to the people who had occasion to pass through the square in the course of the day. By and by their lessening numbers became a noticeable feature, and comments passed on their disappearance. Doubtless the small boy with his popgun and roving dogs could tell many a tale of the murder of the innocents.

It is a wonder that the three survivors of the colony haven't shared the fate of their brethren. The wild in our park squirrel is still predominant, but his tameness is oftentimes to be marveled at. He will trust a man or boy to the extent of approaching him very cautiously and taking the proffered nut from his fingers, but should an attempt be made to touch or fondle him he will resent it in a moment by elusively leaping from his outstretched hand. Audacious and reckless, his instinctive passion for nuts and grain sometimes places him in great danger. A flour and feed store, half a block west of the square, is well known to him. He knows that scattered grains of corn are invariably left by the farmer in unloading his wagon, and he will lose no time in adding these to his store, wholly unmindful of the teams and passing pedestrians in his trips to and fro. Approaching the square from a southern direction one Sunday morning last fall, and while almost a block away, I was agreeably surprised to notice one of the squirrels leisurely trotting down the street in the middle of the car line, swerving neither to the right nor left, and with no apparent object in view "What can be his aim? 'Fresh fields and pastures new,' eh?" I heard some one say. How lucky that no dogs were about, or he might have been obliged to adopt different tactics! How far he would have extended his course it a mooted question, but a small boy directly ahead of him suddenly changed the programme. In his hand he held a shell-bark, and this is what the squirrel was after. Securing his prize he deliberately retraced his course. I felt relieved when he reached the confines of the square, but my anxiety was again renewed when I noticed a pug dog stealing upon his intended victim, who, unconscious of danger, was busily sawing away at his nut. The squirrel did not see the pug until he was almost upon him, then in a moment all his pent-up wildness rose to the surface, transforming him into a little savage. Like a cat he crouched, and before his thick-headed antagonist knew what had happened, the squirrel had suddenly shot over his head, and with lightning bounds gained a nearby elm, where, just beyond the danger line, with body pressed close to the hole, head downward, he contemplated the baffled pug with silent triumph. (I can readily imagine what his smaller brother, the red squirrel, would have done, by way of voice, on such an occasion.)

Our square fox squirrel seems to have inherited the American liking for peanuts. One day last summer one of the park loungers told me that he saw one of the squirrels make several trips across the street to a grocery and pilfer peanuts out of a basket directly within the doorway. I hardly credited this until I was a spectator to something of a like occurrence. Making a short cut across the square one day about noon, I noticed one of the squirrels steal across the street to the grocery and pause at the entrance, where, sitting upright, he contemplated the interior, and particularly a basket of peanuts, with apparent wistfulness. Several amused customers called the attention of one of the clerks to the little intruder, who, divining the squirrel's quest, undoubtedly from past experience, proffered him a peanut, which he gingerly took from his fingers, and immediately went home rejoicing.

As near as I can observe, the cavities in the trees are seldom utilized by the squirrels to deposit their nuts. The burial process is preferred. The flower beds are much in demand, but throughout the length and breadth of the lawn, and in various out-of-the-way places, this nut-planting goes on. These little caches are guarded with considerable vigilance. One day I noticed a boy attempt to dig up a nut directly after the squirrel had finished packing the ground over it, but he was so savagely attacked by the plucky little animal that he didn't relish a second attempt.

Invading the squirrel's precincts I frequently manage to have either a walnut, shell-bark or pecan in my pocket. Should foxy be about, a soft whistle will attract his attention, and if the coast is clear from dogs he will cautiously approach and take the proffered nut from my fingers. But before scurrying away he first determines whether his prize is sound, and in his pretty way manipulates it with his paws, while those sharp teeth of his make the circuit. I can record but one instance when a walnut was discarded after the usual test was applied. Cracking it open I found the kernel to be partially withered. Frequently I find cracked hard-shell nuts, where some kindly-disposed person places them for the squirrels, doubtless ignorant of the fact that nature intended them to open their own nuts to keep their teeth in subjection. One old lady remonstrated with me one day for giving the foxies uncracked walnuts. "The shells were so hard for the dear little things to open!"

To vary their nut and grain diet, slices of apple are sometimes eagerly accepted. But just why a luscious peach was snuffed at and passed by so contemptuously by foxy on one occasion was doubtless better understood by our nut connoisseur than the astonished donor. Watermelon seeds are esteemed a great rarity by the bushy tails. In this connection I witnessed a funny sight early one morning last summer. A disciple of Bacchus, with an extra load aboard, was lying prostrate on one of the park benches, oblivious to all the world. Underneath, in the midst of the scattered remains of a watermelon, two of the squirrels were enjoying an early breakfast on the seeds. Finally one of them emerged from the banquet so liberally spread before them, and in turning his head caught sight of the strange shape on the bench. His curiosity was aroused. He communicated his discovery to his brother, and together they made an exploration of the shape from heels to head. Through it all the inebriate serenely slumbered. He at least was satisfied, if the bushy-tailed explorers were not.

While the squirrels have made friends with nearly every one with whom they came in contact, there is at least one individual—a son of sunny Italy—so the story goes, who looks at their frisky ways with eyes askance. The Italian in question keeps a fruit stand across the street west of the square on the corner of the alley by a clothing store. Some time during last fall he received a consignment of pecans and other varieties of favorite nuts, and having only a small portion of the consignment on sale he stored the remainder, something over a bushel, in the basement of the clothing store for safe keeping. The squirrels, in their open-eyed vigilance, spied this maneuver of the fruit vender, and to make the story brief stole into the cellar unseen, and through much caution and by circuitous routes transported the nuts one by one to their caches in the confines of the square. The Italian discovered the theft just in time to see the last few remaining nuts disappear. It is said that he at first decided to bring suit against the city for damages, but being rather kind-hearted and fearing that the apparently innocent animals might be exterminated he resolved to guard his nuts with more vigilance in the future.

Late last fall I noticed the squirrels carrying withered grass and leaves up certain trees to build their nests. On bright, sunshiny days during the cold season they venture further, but when it is dark and dreary they invariably prefer the snug retreat in a tree's cavity or their warm nests, which may be seen here and there in the trees.

SPRINGFIELD, Ill., March 29.

The Decrease of Wild Life.

At the last annual meeting of the Zoölogical Society of New York a resolution was passed instructing Mr. Wm. T. Hornaday, the Director, to make such investigation as was practicable as to the destruction of birds and mammals now going on in this country, and to report to the society. This report has just been made, and appears as a part of the Second Annual Report of the Zoölogical Society. It was very well that such inquiry should have been set on foot. Mr. Hornaday is excellently qualified to undertake it, and his conclusions may be accepted with much confidence. It was not to be supposed that this inquiry should develop anything startlingly new, but it is eminently desirable that the shocking decrease of our native wild life should again and again be brought to the attention of the public and impressed on as many classes of the community as possible.

The questions put by the Director are four in number:

- 1. Are birds decreasing in number in your locality?
- 2. About how many are there now in comparison with the number fifteen years ago? One-half as many? One-third? One-fourth?
- 3. What agency, or class of men, have been most destructive to the birds of your locality?
- 4. What important species of birds or quadrupeds are becoming extinct in your State?

These questions were addressed to several observers in each State and Territory, and brought replies from nearly 200 observers, representing all of the States and Territories save three. Fully 90 per cent. of these replies bear evidence of much care in their preparation, and they show, what is well enough known, that all our wild life is rapidly decreasing, but especially that "Our most highly prized species, the 'big game' quadrupeds, the fur-bearers, the gallinaceous game birds, water birds, herons, shore birds and most beautiful song birds, are the very ones that are most persecuted, and that are disappearing most rapidly."

The agencies of destruction operating to bring about this result assigned by most of the replies are tabulated by the author as these:

CAUSES OF DECREASE IN BIRD LIFE.

	Reports.
1. Sportsmen, and "so-called sportsmen".....	64
2. Boys who shoot.....	42
3. Market-hunters and pot-hunters.....	26
4. Plume hunters and milliners' hunters.....	32
5. "Shooters generally".....	21
6. Egg-collecting, chiefly by small boys.....	20
7. English sparrow.....	18
8. Clearing off timber, development of towns and cities.....	31
9. Italians, and others, who devour song birds.....	12
10. Cheap firearms.....	5
11. Drainage of marshes.....	5
12. Non-enforcement of laws.....	5
13. Gun clubs and hunting contests.....	5
14. Trapping birds for sale alive.....	2
15. Prospectors, miners and range-riders.....	2
16. Collectors (ornithologists and taxidermists).....	5
17. Colored population.....	4
18. Indians (for decrease of game quadrupeds).....	4

This is a list of eighteen agencies, of which all but four cover some form of killing birds, chiefly for food. The only two that are not likely to be interfered with by legislation in any form are the eighth and the eleventh in this list, namely, clearing off of timber and drainage of marshes. Other things being equal, the larger the mammal or bird the greater its danger from pursuit; yet the small finches are not exempt, while the destruction of birds' eggs by collectors and small boys is of course an important factor. The killing of birds for

millinery purposes is something which goes on all the time, but the sentiment against this is growing, and we believe will ultimately prevail.

The practice of conducting side hunts, which still prevails in certain parts of the country, does its part in this work of destruction. Men divided into opposing companies start out with their guns for the sole purpose of killing as many wild creatures as possible. Nothing is spared, everything counts. It is a shameful rivalry for blood pursued by men who would be shocked if the hundreds of lives sacrificed for their so-called sport were deer or antelope.

Mr. Hornaday, judging from the reports which he has received, has drawn up a table of percentages which shows, according to his figures, that "for the whole thirty States represented in the diagram the average loss in bird life for their combined area is 46 per cent." On the other hand, the report shows that in four States bird life is on the increase instead of on the decline. These States are Kansas, Wyoming, Washington and Utah. We should be disposed to ask for better evidence than can be here presented of the truth of this inference. Three of the States named are in the arid belt, and in them during the last fifteen years tree planting has gone on very extensively. This would result in the presence of many species of birds not previously observed in many localities, and it is possible that it is the presence of these new forms of bird life which has led correspondents to report as they have. On the other hand, in Washington the dense forests have in many places been cleared away, and this has led to the advent of species frequenting the open country which are wholly new to the locality.

In many places species of large mammals and even of the larger birds are reported as having become extinct; and this is inevitable with the spread of settlements and the contraction of the range. This must inevitably continue until such time as suitable reservations shall be set aside purely as game preserves in various parts of the country. This subject is one which has received much attention in FOREST AND STREAM.

Mr. Hornaday's conclusions as to birds and mammals we give below:

Recommendations Regarding Birds.—While at first thought it may seem impossible to propose a series of universal laws for bird protection that can save our bird fauna from annihilation, even if adopted by the different States, we believe it will be found on close examination that the task is not nearly so difficult as it seems. The difficulty lies, not in the framing of comprehensive measures, but in securing their adoption in the various groups of States wherein they are needed. The business of securing the enactment of legislation is a separate question, and need not be discussed here. As to the character of the legislation that would be most effective, there are certain demands so imperative as to be perfectly obvious, and the laws that would satisfy them would be so universally beneficial, their enactment would be desirable for every State and Territory, save two or three. They are as follows:

- 1. Prohibit all egg-collecting, except under license from State Game Commissioners, and the payment of a license fee.
- 2. Provide for the extermination of the English sparrow.
- 3. Prohibit the sale of dead game at all seasons.*
- 4. Prohibit the killing or capture of wild birds, and of quadrupeds, other than fur-bearing animals, for commercial purposes of any kind. (This will stop the slaughter of birds for millinery purposes.)
- 5. Prohibit all spring shooting.
- 6. Prohibit the carrying or using of a gun without a license.
- 7. For three years prohibit the killing or capture of any birds, except such birds of prey as may be declared by the U. S. Biological Survey to be sufficiently noxious to merit destruction. The only exception should be in favor of persons desiring to collect for scientific purposes, in moderation, and then only when properly vouched for by some scientific institution, and duly licensed by the State Game Commissioners.
- 8. At the end of three years, restrict by legal enactment the number of game birds that may be killed or taken in one day, or in any given period, by a single individual.
- Recommendations Regarding Mammals.—1. As a matter of duty to their own interests, the guides, hunters, ranchmen and sportsmen of the Rocky Mountain and Pacific Coast regions should assemble and decide what restrictions shall be placed upon the killing of large game—as to the number of head per man that may be taken, license fees and fines, and as to the necessity of total prohibition for given periods.
- 2. Every State and Territory now inhabited by large game should immediately enact a law prohibiting the killing of any female hoofed animal, under any and all circumstances, and also prohibiting the killing of any hoofed animal less than one year old.
- 3. Throughout every State and Territory now inhabited by them, the killing of antelope, mountain sheep and mountain goats should be absolutely prohibited for ten years; and the possession of a fresh skin or head should be regarded as prima facie evidence of violation of law.
- 4. Henceforth every person visiting the Western regions in quest of large game should regard it as his duty to cooperate with State and Territorial authorities in the observance and enforcement of the game laws, to kill sparingly at all times, and under no circumstances to shoot female or yearling animals.
- 5. No guide should conduct a hunting party in quest of game unless each member of it pledged himself to observe the rules of moderation in shooting that now are morally binding upon all.
- 6. In view of the alarming decrease of our large game animals, it is time for the adoption throughout the United States of an unwritten law that any man who kills a female hoofed animal is not considered a true and honorable sportsman.
- 7. Every State and Territory containing large game should collect a license fee on each gun carried or used in hunting; and all funds derived from this source, and from fines, should be used in payment of the salaries of game wardens.
- 8. The sale of dead game should be prohibited.

* This has long been earnestly advocated by FOREST AND STREAM, and the proposition is constantly gaining advocates. It is also one of the planks in the platform of the League of American Sportsmen.

Vitality of the Wild Goose.

FARMER H. N. CLEMENT, of Lowell, Lake county, Ind., was gunning in the Kankakee marsh. He came upon a flock of wild geese and bagged several of them, one of which astonished him by having as a breastpin an arrow gin, long. That goose became the wonder of the neighborhood and the study of scientists, the only conclusion reached being that, wherever the wild bird came from, there it got the arrow, so unique in formation that it could be assigned to no tribe of Indians in the United States or any other known country. Finally Prof. O. T. Mason, of the National Museum, said the bird and arrow could have come from no other place on the globe than the Yukon Valley, for except in that region no such arrows are made.

Science does not pretend to say how long the goose had carried the arrow of a Yukon tribesman until it met its death from the shot of a civilized gunner down on an Indiana marsh. The bird disdained the weapon of a savage, but turned up its legs to the marksmanship of the Hoosier farmer years afterward, and thousands of miles from its summer home in Arctic desolation, as it was journeying southward.—Cincinnati Enquirer.

Game Bag and Gun.

Calling Moose in the Daytime.

I HAVE noticed that some of your contributors have spoken of calling moose in the daytime as a recent discovery, and only practiced in New Brunswick and Nova Scotia. I know certainly that moose were called in the daytime in Maine forty years ago; and I believe that daytime calling had been practiced long before that.

I had several times been told by friends of moose coming to them when chopping in the daytime, having evidently mistaken the sound for the calling of a cow; but I never saw a bull called in the daytime till in September, 1857. Hiram L. Leonard, the well-known fly-rod maker, and myself had on Monday camped on Caribou Lake at the mouth of Ragged Stream. Mr. Leonard had in less than two days of still-hunting killed four moose by tracking them in the moss and leaves. It was now Saturday, and as we had fired numerous shots, and had our camp-fire burning for a week, it was a most unlikely place for calling a moose. The sea, which at daylight was too heavy to cross the lake, had by 9 in the morning subsided, so that we had packed up and were just ready to start when we saw a canoe coming up the lake. They proved to be two well-known hunters—Joe Diamond and Sam Parker. One of them wished Leonard to show him how to call a moose. Leonard for fun made all kinds of noises except such as a moose could ever be expected to come to, and finally called correctly several times. We were not looking for moose, as we had no thought of a moose coming in on a rocky shore in the daytime, close to a camping place; but one of them, who had been expecting moose to come, suddenly said: "There is a bull!" And sure enough, one was walking along the shore in the water, some thirty to forty rods away. It was their moose, as they had seen him first, but as they had quarreled on account of one of them having missed three fine shots at bears, they told us to go and kill him. Mr. Leonard handled the canoe very skillfully, and the moose was shot.

That night we camped at Chesuncook Carry. About 6 o'clock, while it was still daylight, I went down to the canoe for a pail of water, and seeing our calling horn lying on the breastworks where we had landed our stuff, I called, and at the first or second call was answered by two bulls, one on our side of the lake not over a mile off, the other across the lake nearly a mile away. We at once started out, but called in vain on our side, as he had winded our smoke and would not answer. The other answered regularly and began to travel toward the lower end of the lake nearly two miles off. We kept nearly abreast of him, calling at intervals, and finally he came to us at the foot of the lake.

Four days after this, as we were pitching our tent, just above Abol, on the west side of the Penobscot, I was sharpening a tent pin, when a bull gave such a roar as I never knew a moose could make. We both thought that he was charging right down upon us. After looking for him on our side of the river I set Leonard across while I pitched the tent. He soon came back, saying there were three—a bull, cow and calf—and that we would hunt them after dinner; so we did not build any fire, but ate a cold lunch, and putting on moccasins, crossed over. After following tracks some time we came out to the river and saw the old bull standing near the river, and slowly turning his huge horns. We started to creep up behind him, when we heard the cow call in some thick alders on the further side of a narrow strip of meadow. We at once started for her, but the bull got there first and was shot by Leonard when we were within 10 ft. of him.

Again, in 1858, as Mr. Leonard, W. H. Staples, P. Antoine Tomah and myself were going down the Allegash, a bull and cow started which were near the river. Leonard and Antoine followed them by the tracks in the moss till they separated, and then took the bull's track. After following a fourth of a mile one of them made a horn and called. At the very first call he came, making, as Hiram said, "a noise like pounding the joints of a frame together." He came directly to them, and was shot at short range. This bull had very large horns. This proves not only that they will come in the daytime, but that sometimes they will come in thick woods. Later the same fall, when we were near Blue Mountain Bend on the Tobique River, we saw a very large bull on the bank, evidently trying to find a cow which he must have heard, as he was answering. He allowed a canoe to be poled as near to him as was desired. This was done in perfectly open water, and one of the men had on a bright red shirt, which shows how stupid a moose sometimes is. We camped there that night, and in the evening heard a cow calling on the opposite bank. It is probable that he had heard her and was answering when we found him.

The same fall I heard a calf calling for its mother. It made a low whining noise. I had seen its mother cross the river a few minutes before.

Late in the fall of 1859, while fur hunting on Cancemgemmock, my partner, who was looking a sable line on St. Johns waters, was driven behind his camp-fire by a bull, which came to the sound of his axe. He had a fire in front of a small, open-fronted camp of new cedar splits, and was cutting up his night's wood. The moose rushed up, and when he retreated into the camp kept walking back and forth, just the other side of the fire, for a long time, all the time grunting as they do when answering a cow. He seemed perfectly furious at being deceived and not finding the expected cow. My partner was a man of good courage, and knew all about moose, but having only a single-shot rifle pistol, thought it safest to let him alone.

I could cite many other instances of moose coming in the daytime, but the above are sufficient to show that it has long been a well-known fact that moose will come in the daytime. Mr. Leonard seldom called moose for the sake of shooting when they came, but more to get a fresh track to follow. I often see long articles written by those who, by the help of a guide, have shot a moose—or their guide has shot one for them—or as is often the case, have bought a pair of horns—in which they

tell of their feats as hunters. Thirty or forty years ago things were different. There was no guiding. When a man went hunting he was obliged to know how to handle a canoe, cook, pitch his tent, and kill what he got.

In the fall of 1857, after Mr. Leonard had returned from a trip with me, when he had killed five moose in hunting less than two and a half days, he started back early in October. He was gone three weeks. He returned to Caribou Lake. The time occupied in going and coming and Sundays left him but ten or eleven days, and in that time he killed eight moose by fair still-hunting on dry leaves, and skinned and stretched his own game, making a record of killing thirteen moose in less than fourteen days. Mr. Leonard used to tell me that in any kind of a fair chance he could average a moose a day by still-hunting, and what I have seen him do would prove it. It may be said that he could do it because moose were plenty and tame in those days. While moose were plentier, they were not so much plentier than now as some may think, and were certainly much wilder. Moose and deer both are much easier to approach now in the first of the season than they used to be. Then they were shot at all seasons, and were kept wild; but now, seeing men and not being molested for months, they are tamer in the first part of the season.

To show the difference then between hunters, I will say that in 1857 we met two men who were called as good water hunters as there were. They had been out three weeks, water hunting and calling, and had not killed a single moose. To show what a man can do who understands his business, there is a man now living in Bangor—Mr. Samuel Whitcomb, an old partner of Leonard's—who in one day shot five old bulls with a single-shot muzzleloader by fair still-hunting on a light snow. The horns of one of these spread 60 in. P. Antoine Tomah in the fall of 1858 killed four old bulls and wounded a fifth in one day on light snow. Maine men used to know how to hunt, but they did not do it with a pen.

M. H.

Manitoba Game Interests.

WINNIPEG, April 14.—*Editor Forest and Stream:* On April 8 a deputation of delegates appointed by the different field trials and gun clubs by appointment waited on the Provincial Government Law Amendments Committee, for the purpose of impressing on the Government of the Province the necessity of their amending the present game act.

The attached is a copy of the address delivered before the committee by Mr. G. B. Borradaile, the Manitoba Field Trials Club's delegate. As it fully describes the different clauses of the bill now before the Government, you would confer a favor on the sportsmen of the Province by making mention or publishing as much of the address as the columns of your paper will permit, and greatly oblige

WILLIAM CHEE, Hon. Sec.-Treas. M. F. T. Club.

Mr. Borradaile's Address.

Mr. Chairman and Gentlemen: As one of the delegates of the Manitoba Field Trials Club, whose object is not only to improve the breed of sporting dogs, test their field qualities, etc., but to increase the interest of legitimate sport with dog and gun, I beg to point out why the club considers it necessary to appeal to you to amend the present game act.

You are aware that under the present act it is permissible for a person to visit the breeding grounds of the prairie chicken, grouse, pheasants and partridges between Sept. 15 and Dec. 1, and kill as many birds as he likes.

Gentlemen, I feel sure you will agree with me that this law would be an ideal one if the sportsman hunting would not kill more than twenty birds in a day, and refrain from shooting birds on the ground, off wheat and other stacks, and trees. Unfortunately we have in this country a few persons who pose and call themselves sportsmen, who contend it is perfectly legitimate to kill large bags of this kind of game, not only at the beginning of the season (when birds are very tame), and necessitates their being either sent to cold storage or left on the ground to rot, but who again visit the feeding grounds before the season closes and make large bags by shooting these birds off grain stacks and trees.

The present game act allows the kind of shooting I have mentioned. This being a fact, you will agree with me as to the necessity of its being amended.

Personally I regret the necessity of appealing to you to do so, as it will debar myself and others from hanging a few brace of grouse for winter supply. At the same time we all recognize the necessity of advocating the passing of legislation that will, if properly enforced, tend to better protect these grand birds that remain with us all the year round.

My reason, Mr. Chairman, for saying "if properly enforced," is, I believe there is a feeling among several of the members of the Legislature of the necessity of passing an act, on the plea of their scarcity, prohibiting the shooting of prairie chickens, etc., for a year or so. We, as a club, contend that even if such an act was passed it would not accomplish the desired aim of its promoters unless proper game guardians are appointed to enforce the law. As far as the scarcity of prairie chickens is concerned, I beg to say to you, gentlemen, that never before in the course of a residence of over twenty-two years in this Province have I ever known chickens to be as plentiful as they were in several parts last season.

It is certainly true that in certain localities they were scarce, which can be accounted for by floods in the springtime, also to prairie fires the previous autumn, which burned up their food supply; but more particularly can this be traced to the severe winter of 1897, when snow covered the ground so deep that food could not be had on the prairie, necessitating the chickens, etc., going into the timbered country, where food could be found in abundance and shelter the best. Those birds that migrated to that kind of country hatched there, and today can be seen in thousands.

Mr. Chairman, I do not think a more perfect bill could be framed for the better protection of all varieties of grouse, prairie chickens, pheasants and partridges than the one introduced at this session by Mr. Fowler, and

which I understand rests with you, gentlemen, whether it becomes law or not. The following valid reasons show why we believe the bill to be perfect and at the same time why it commends itself to all sportsmen who have the true welfare of the game birds of this Province at heart.

First—Because it shortens the open season by nearly a month, thereby prohibiting the self-designated sportsmen from visiting the feeding grounds during the cold, frosty mornings and evenings just before the season closes, and shooting birds in their own peculiar way, i. e., off stacks, trees, etc.

Second—It prevents persons from having in their possession fifteen days after the closing date of shooting any of the game mentioned. This will be considered by those sportsmen who make moderate bags somewhat of a hardship; at the same time they will agree with me that if we are sincere in our protestations to protect the game we must be willing to make some sacrifice, especially as we know that in doing so we are assisting you gentlemen to make a simple law that will permit of being enforced.

I have been asked, and refused, to advocate the passing of an act permitting fifteen brace of any of the birds mentioned to be in the possession of a person after the season has closed. My reason for refusing is, I am anxious to see an act passed that will permit of being enforced with the least possible trouble. If it is permissible to have fifteen brace of game some shooters would find it an incentive to have more than that number of birds in their possession when the season closes, necessitating the individual having more than that number calling upon his friends to help him to evade the law by taking birds under their protection.

Mr. Chairman, if you require any further evidence of the necessity of prohibiting the game mentioned from being placed in cold storage, I beg to be allowed to refer you to Mr. F. Sprado, the manager of the Manitoba; or to Mr. W. J. O'Connor, the proprietor of the O'Connor Hotel, Winnipeg, who will be pleased to inform you that prairie chickens and grouse can be purchased during the closed season.

Now, gentlemen, if you allow Mr. Fowler's bill to become law, you will make it an offense to have birds in possession fifteen days after the shooting season closes. Such a law will prevent prairie chickens, etc., from being hung up in cold storage or the back sheds of houses, in April, that should be out on the prairie breeding.

Mr. Chairman and Gentlemen, I again beg to be allowed to point out to you why the club I represent is anxious you should amend the present act, which reads as follows: "Any kind of wild duck, sea duck, widgeon or teal, between Sept. 1 and May 1," by allowing Mr. Fowler's bill to become law, which makes it an offense to kill the birds I have mentioned between Jan. 1 and Sept. 1 following.

First—Because it is in unison with the aims of our brother sportsmen to the south of us, who met in the city of Chicago on Feb. 7 last, for the purpose of drafting uniform game laws to be presented to the different State Legislatures, unanimously drafted a bill prohibiting the killing of any kind of wild ducks between Jan. 1 and Sept. 1 following.

Second—Experience has taught those sportsmen who shoot in the spring that if ducks are protected at that time they will nest in the Province. In many a late spring the birds arrive here mated and ready to begin housekeeping at the first quiet spot, but as the law now stands they are warned to "move on" by random guns at every slough and water hole they stoop toward. If the shooter cannot get enough shooting in the fall, let him take the advice of that prince of sportsmen, the editor of Field and Stream, and follow the ducks south; but "make it impossible for him who has abundant leisure to minimize the sport to him who has but a few days in the year that he can give to a shooting trip. Given immunity from danger in the spring, wildfowl would nest about every piece of water in the Northwestern States, and raise an enormous food supply and afford good sport till freezing time."

Gentlemen, that is the opinion of one of the recognized authorities on all matters appertaining to field sports.

Third—It does away with the chance of prairie chickens and grouse, etc., being shot by the self-designated sportsman.

Under the bill Mr. Fowler has introduced it is permissible to have all kinds of ducks and geese killed during the open season in possession during the winter months. Surely, Mr. Chairman, this concession should satisfy any fair-minded sportsman.

With reference to the appointment of a paid game guardian I am led to believe that on the plea of your Legislature having no funds with which to pay a guardian it is out of the question to expect the Government of this Province to appoint one.

Mr. Chairman, I do not hesitate to assure you that if the Government appoint a thoroughly competent game guardian, whose whole time will be devoted to looking after the game, and the enforcement of that act, the revenue derived from fines, etc., will more than pay his salary. While on the subject of that appointment of a game guardian, let me inform you, Mr. Chairman and Gentlemen, the importance of the guardian receiving your instructions to affiliate with every club and sportsman in the Province, who will, I feel sure, be only too anxious to render him every assistance in bringing violators of the law to justice.

For further evidence of the necessity of the appointment of a guardian, let me call your attention to a recognized fact, i. e., that no country in America is known better, or is more widely advertised on account of its game, than the Province of Manitoba. The Governments and railways make particular mention of the different kinds of game that can be shot within its boundaries. Under the circumstances, it is not only reasonable for the sportsmen of the Province to expect both these bodies to contribute toward protecting the game, the former by paying a guardian his salary, eac., and the latter by giving him free transportation?

Mr. Chairman and Gentlemen, let me conclude by asking your serious consideration of the points that have been brought to your notice in my endeavors to bring before you data that it is earnestly hoped will be of as-

sistance to you in framing amendments to the existing game act.

I beg to say that in presenting it in the manner done I have only been actuated by the desire to have a law placed on the statute books of the Province that would commend itself to the sportsmen.

(Signed) G. B. BORRADAILE.

CHICAGO AND THE WEST.

Close Season.

CHICAGO, April 15.—To-day ends the open season on ducks in Illinois, and henceforth the wily jack snipe will occupy the center of the stage. The spring of 1898, so far as can be determined by a general review, was about in proportion with preceding springs, that is to say, there are fewer ducks this spring than on the spring before. This is a conclusion reached rather by a look at the amounts of game marketed than by anything else. Of course we had the customary reports of heavy flights, which were indeed true, so that there was foundation for the usual rumor that the ducks were "more numerous than for ten years past." We always hear that report when a good flight is in on some of the better known marshes. The flight comes in big waves, not in a steady flood, and when one of the great north-bound bodies of fowl drops in it surely seems that there are ducks enough for everybody for all time to come. In due course, however, comes the corollary, scattered advices that So-and-so went to such and such a place, on the strength of reports that there were thousands of ducks, but So-and-so was very much disappointed to discover that the ducks were very scarce. The shooting was very patchy this spring, as one must conclude after watching the varying reports. After the first heavy bags, made just as the ice was breaking up, very little good shooting was had along the Kankakee country. It was better on the Illinois River, but very irregular there. Lake Senachwine and Swan Lake offered sport beyond the average of some years, I should say. The Mississippi River flight was better than it was last year. More birds were killed in upper Iowa than for some time. In Wisconsin I should say the shooting was not so good as it was last year, and this I am disposed to believe applies also to Minnesota. The Arkansas River flight was not so good as it should average, but on the contrary the flight on the Platte was better than it was last year, though ordinarily there is some relation between the numbers of birds on these two standard streams. I have heard of some good bags of redheads and canvasbacks in upper Iowa, but do not think that the Lake Koshkonong, Wis., canvasback shooting was so heavy this spring as it was last; at least I have not gotten word of so many parties having success. A week ago Harry G. Carter, of Janesville, made a bag of fifty-six on Koshkonong, but he reports a good many hunters unsuccessful, though there was quite a body of birds in on the lake, keeping out in the open.

Job Lot of Albinos.

By all odds the rarest and most valuable bag of fowl made this spring in this vicinity, so far as I can learn, was that made by Henry Ehlers, of the Diana Club, whose grounds are across the river from Water Valley, Ind. Mr. Ehlers killed on the same day two albino redheads, a male and a female, beautiful specimens both of them, and very much prized by the hunter, as may be supposed. But not content with this, he killed on the same day a white mallard, his third albino for the day. I think this bag will hardly be duplicated for some time. Mr. Ehlers has had all three of these birds mounted, and it will be many a day before they cease to interest him.

It is singular how adventures flock to a man sometimes. This same hunter, Mr. Ehlers, on this same trip, was trying for a shot at some geese on ground where he had a right to expect some geese. He had out a couple of dozen of goose decoys, and was well concealed in his blind. He had arisen early, and became sleepy, and the blind being comfortable, he fell asleep. He was awakened by a slight noise, and sat up to witness his decoys mixed up with a flock of wild geese which had alighted among them and were trying to make out what made the stationary birds so unsociable and hard to get along with. Mr. Ehlers was so sleepy that he hardly knew what he was doing, and managed to discharge his gun before he was quite ready, but he killed two geese at the first shot, and got another with the second barrel. This little hunt of his was a remarkable one, Mr. Ehlers thinks. Of course down in Texas or up in Dakota no one would think of boasting much about killing three geese, but along the Kankakee this is to-day a great feat. Perhaps I should add, by way of interest, that none of the geese was an albino, Mr. Ehlers having concluded to kill no more birds which were not fast color.

Jack Snipe.

The flight of jack snipe is in and has been for a week, and it is to be said that this erratic bird is proving about as near a constant quantity as he has been for some time in these parts. Last Saturday at the marshes along the Kankakee River a great many guns were out, and nearly all got bags. At Koutts, Ind., Oswald von Lengerke and Mr. Shaw got 31 jacks, mostly on the edge of the marsh and on meadows which were pretty dry. Around the Calumet River, near the Calumet Heights Club, last Saturday 17 jack snipe were bagged by different members.

At Maksawba Club last Saturday a number of guns were out, and the sport was good so far as abundance of birds was concerned. John Watson and his retriever got an even dozen birds between them, counting in the cripples the dog picked up. L. R. Brown got 8 jacks in an hour's shoot. W. P. Mussey got the same number in a short time, and Mr. R. B. Organ and man secured 28 jack snipe and 46 prairie plover ("grass snipe"). Of these latter small but temptingly accessible birds each gun took liberal toll as the big flocks swept by. W. R. Haskell killed two or three dozen of them, and six or eight jacks also. Each man came in with stories of plenty of birds, and the flight kept on dropping in all day long, but the birds were wild and the

wind very high, so that the sport was rather exacting. The water was just beginning to fall, so as to put the marsh in good shape, but the feeding grounds were yet too deep under water over the greater part of the marsh. On ground like this the birds got little feed, and would not lie well, going up at 35, 45 or 50 yds. ahead at the first sound or sight of a hunter. It took long range work, but made good fun for the shooters. The latter all report that, contrary to what might have been supposed, the wettest marsh, close along the banks of the stream, and not out at the far edge, along the dry fields, was the best place to find the birds. The ways of the jack snipe are inscrutable, and nobody but a Kankakee marsh man can find them out.

The Jack Snipe's Paint Brush.

I mentioned above the name of Mr. W. R. Haskell. The latter is an old-time club member and all-round shooter of this city, a good woodsman or marsh man, and not altogether a bad naturalist. It was he who told me something which I never knew before, and which perhaps a great many others never knew about the jack snipe.

"Do you know where the finest paint brush in the

CIRCUMSTANTIAL EVIDENCE.
A Victim of the Snare.

world comes from?" he asked me, "a brush finer than the finest camel's-hair, and more prized than any other by artists for certain sorts of work? I'll tell you. It's out of a jack snipe's wing.

"An artist told me this once—a portrait painter able in his profession. He said that he used this natural paint brush a great deal in his work, more especially in painting in the eyes of his portraits. He said that he would not be without one of these fine little brushes for any money if he had no way of getting another. Now tell me, where do you suppose this paint brush is carried by the jack snipe?"

I had to admit that this was all news to me, and Mr. Haskell continued: "Well, we'll see if we can find it. I said I would show it to you, and now let us see if I can find it myself. It's here on the wing of the bird, just at the outer edge of the long wing feathers, close up to the butt of the quills of the outer edge. See, here it is."

He had been examining and turning up the feathers along the edge of the wing of a jack snipe as he spoke, and sure enough he produced the paint brush, a delicate little feather about three-quarters of an inch long, with a fine little quill running up the middle, and edged with just the finest, most minute little hairy bristles of web, the whole terminating in a point which made the feather look like a solid little splinter. Touched on the end, these fine fronds were seen to spread apart into little soft teeth, closing up again, when released, like a stiff

but delicate brush. It was indeed an exquisite little brush, suited for soft light touches of color.

I do not imagine that very many men ever knew of the jack snipe's paint brush, and perhaps not everybody will be able to find it now, but it is there. For what purpose, I wonder, this rudimentary little quill with its soft tip? Surely a wilder or more elfsome tool never grew ready for the hand of man. Methinks some artist should do great things yet with this brush, which should hold many strange things in its power, many scenes of many lands, fitful and evanescent, but fascinating and alluring. It is a weird thing, this jack snipe bird, and this is the weirdest thing I ever learned about it.

From the Musk Ox Country.

There arrived at Winnipeg, Man., last week a traveler from a strange country, clad in strange garb and telling a wonderful story of experiences. This was Mr. L. Clifton, Fellow of the Royal Geographical Society of England, who has spent a year in the far North, beyond even the most adventurous gold seekers. Mr. Clifton left Winnipeg in March a year ago, and traveled to Fort Churchill, the last post on Hudson's Bay. He then went north to Hell's Gate, thence going among the Eskimo tribes, with whom he went on to Chesterfield Inlet, where he arrived in October. From this point he traveled 250 miles to the Maxendegate Hills, which he was the first white man to visit. At this point he concluded to go on a trip after a musk ox, and set out on a journey of thirty-five days further into the Arctic wilds. He was successful at last in getting a good head, which he brought all the way out with him, though he nearly had to eat it before he got back to Chesterfield Inlet. Not daunted by the horrors of the Northern winter he set out from Chesterfield Inlet Dec. 30, having with him three Eskimos, nine dogs, 10 lbs. of flour and 3 lbs. of tea. It was 600 miles to Fort Churchill, but he made it safely, an unprecedented winter trip. Thence it was a small matter of 900 miles more to Norway House, and he seemed to be well and hearty at Winnipeg. Mr. Clifton travels for the love of it, and knows northern Mexico, northern Africa and northern Russia very well. In 1894 he went over the Chilkoot with Wm. Ogilvie and explored the Yukon River from source to mouth, and learned then of the gold fields which have since been so largely exploited. One envies Mr. Clifton his active life in wild regions, but the story of his travels leaves one but small hope of ever getting into a new country, so far reaching already, it seems, has been the eager human foot.

With Pack Train to the Yukon.

Mr. Hamlin Garland, a well-known literary man of the West and of the East, called at the FOREST AND STREAM office this week on his way to the coast. Mr. Garland has a commission from McClure's Magazine, of New York city, and will take a very interesting journey across a very nice part of the mountain country of the West. He goes to Ashcroft, British Columbia, and thence travels horseback over the old Hudson Bay trails to the Hazelton post and Stickeen river. He will descend the Hootalinqua to the Yukon waterway, and thence drop down to Dawson City, which point he expects to reach not later than September. He will then come out from Dawson over the Dalton trail, which he thinks will by that time offer post horses for a price and feeding stations at proper intervals. Mr. Garland will have but one companion, and they will take but three pack horses, or five horses in all. They expect to go over a practically well-known country, and will have permits to outfit at the Hudson Bay points, so that they will not need to take in much outfit. They will pass over a splendid game country, including some of the best bear country of the continent, it is said; but Mr. Garland says he has not lost any bear and is only going after types for use in literary work. Of course he cannot expect to get much knowledge of the resources of the country in so hurried a trip, but as a vacation undertaking it should prove a distinguished success and any man who ever toted a gun must envy him the good fortune which makes it possible. Mr. Garland expects to be back in Omaha, via Dawson City, by next October, to fill engagements as chairman of the literary congress at the Omaha Exposition. For my part, if I ever got tangled up in that bear country, they could take their old exposition.

Wolf under Chicago Post-Office.

In the old days, yet not so very long ago, here in Chicago, they used to shoot ducks at Pullman, deer at Madison street, Indians at Rush street and wolves about anywhere. On the spot where the Chicago post-office stood—the old post-office which was last year torn down to make room for another and bigger one—there prowled in the old days the foot of many a big gray wolf, as we may well imagine. But no one would suppose that a gray wolf would ever be found underneath the foundations of the old post-office. Such, however, was the case, as I may of my own eyes testify. When they began excavating for the new foundations the workmen came upon a very good quality of clay, not a very pretty clay, in fact a sort of slaty blue clay, but none the less a plastic and tough and enduring clay. In some way word of this came to Mr. Edward Kemeys, the famous sculptor of wild animals, whose home is in a suburb of this city. Mr. Kemeys made a visit to the old post-office grounds, and saw that the clay was good modeling clay. He had four tons of it taken to his studio, and he has been making wonderful things out of it since. The first piece which he modeled was the figure of a big gray wolf, a wise, knowing, thoughtful but cynical gray wolf, such as no doubt at one time trotted over the site of the post-office, looking back over his shoulder to see if anything of interest was going on behind him. This is the wolf which was under the post-office, and it is a good wolf. A great many million people have passed that spot, never dreaming that the wolf was there at all.

E. HOUGH.

1206 BOYCE BUILDING, Chicago.

BERLIN pays a salary to a professional bird-catcher, who keeps scientific institutions supplied with birds, nests and eggs. He is the only man in the empire permitted to do so.

The Big Buck of Spring Pond Carry.

SARANAC LAKE, N. Y., April 1.—*Editor Forest and Stream:* Last October I went to First Pond, in the Bog River Chain, in Township 2, St. Lawrence county, a distance of about two miles from Long Lake Station, to prepare a camp for Messrs. Hoopes and Smith, of Philadelphia, who had engaged another guide and myself for a fifteen days' hunting trip. On Oct. 4, after the camp was built, and before the gentlemen had come in, I started out by myself for a still-hunt, my companion also doing the same. I walked up to Spring Pond carry, about three-quarters of a mile from our camp, and soon my attention was attracted by the moving of bushes a short distance in front of me. I raised my rifle to be ready to shoot instantly should it prove that a deer was there, and stood perfectly motionless on the trail. In about a minute I saw a buck's head with a most prodigious pair of antlers. The deer was not more than six or eight rods from me, and was hooking brush. As he moved along at about a right angle from me toward the trail his whole body appeared to view, and I saw at once that he was a monster buck. He stepped into the road and instantly turned his head and looked directly at me. As I fired he bounded into the air and dropped dead about three rods from the place where he stood when I shot. I had no means of weighing the buck, but he would easily dress 300 lbs., and was the largest deer that I heard of being killed in the Adirondacks last season. I was back to the camp with the deer in just one hour and thirty minutes from the time I started out from it on the hunt.

The property upon which this buck was killed is owned by Messrs. William R. and Frederick A. Weed, of Potsdam. It is situated in the southern part of Township 2, St. Lawrence county, and contains First, Second, Third and Fourth ponds, known as the Bog River Chain; Hornet, Three Pound, Spring, Long, Bradford, Alford, and a number of other ponds, while the Bog River runs through nearly the whole tract, which consists of about 4,400 acres. I do not believe the hunting and fishing to be had here is surpassed anywhere in the Adirondacks. The speckled trout in the ponds run from ½ lb. to 3 lbs. in weight, and once last August, in the latter part of the month, while fishing in Spring Pond, one of our party caught a speckled trout weighing 5 lbs. This, of course, was an exception, but large trout are the rule here.

In regard to the game laws, I would like to say that I approve of the action of the Legislature in passing an anti-hounding bill, and believe that with no hounding of deer in the Adirondacks for five years these animals will greatly increase in number, which must necessarily prove a benefit to the country and its inhabitants. The fact that I killed this deer while still-hunting is sufficient evidence that large deer can be shot and killed without the use of hounds; and as for sport, I never had so much pleasure and satisfaction in capturing a deer before in my life as I had in still-hunting and shooting this big buck.

E. E. SUMNER, Guide.

Jackson Hole Game.

JACKSON, Wyo., April 7.—I am pleased to report to you that all the game in the Jackson Hole country has passed the winter successfully, except such as has been killed by mountain lions and coyotes, with now and then by a person who has no interest in game in any country. The elk are now working toward the Yellowstone Park, their natural and safe breeding grounds.

I fail to see in any particular how the annexation of the Teton Timber Reserve to the Park will be beneficial to the game unless all of Jackson's Hole Valley is included, as there is no game winter range therein where game can successfully winter; and if the lower valley residents are precluded from ranging cattle on the proposed Park extension they will necessarily have to use the lower ranges of elk for a summer range for cattle, thus destroying at one fell swoop the entire band of elk now using it. Cattle are fed here for from 100 to 125 days, and the fields are in main the support of the elk. It looks to me as though the promoters of the Park extension must insist upon the whole valley going into the Park. Sure it is that the upper valley includes some fine scenery as well as some dangerous game destroyers, which the annexation will probably cover—the one with the other.

THE THIRD TETON.

Ring-Necked Pheasants for New Jersey.

IN his last report to the New Jersey Fish and Game Commissioners State Game and Fish Protector Charles A. Shriner reports that 250 ring-necked pheasants have been distributed to various points in the State. In the distribution the first attention was paid to associations of land-owners who control lands where the birds would be given a chance to thrive; next in order came farmers and other individual land-owners who could offer protection for the birds, and then followed individual applicants who desired to liberate the birds in suitable places. In this way it is hoped that the birds will be given a chance and that in the course of a few years they will become well established in all parts of New Jersey where the absence of pot-hunters will permit of such a course.

New York League Incorporated.

THE New York State Fish, Game and Forest League, of Seneca Falls, was incorporated by the Secretary of State on April 16 for the protection of the fish, game and forests in this State. This is a reorganization of the New York State Fish and Game Protective Association. The incorporators are: W. S. Gavitt, of Lyons; R. P. Grant, of Clayton; E. G. Gould, of Seneca Falls; O. C. Cornwall, of Alexandria Bay; C. W. Smith, of Syracuse; Percy Landsdowne, of Buffalo; C. B. Lapham, of Canandaigua; G. R. Beck, of Auburn; W. E. Wolcott, of Utica; J. E. Emerson, of Lockport; Aaron Mather, of Honeoye Falls, and L. D. Lunt, of Dunkirk.

SOME one having died, a man of birth and fortune in the West Country, celebrated in his life for drawing pretty freely with the long-bow, it was remarked that the heir had buried him with much pomp, and had ordered for his remains a handsome monument; "wi' an

epitaph," said John Clerk, in his broadest Border dialect; "he must hae an epitaph, an appropriate epitaph, an' we'll change the exordium out o' respect. Instead o' the usual 'Here lies,' we'll begin his epitaph wi' 'Here continues to lie.'"

Sea and River Fishing.

Dry Fly-Fishing.

BY GEORGE A. B. DEWAR (AUTHOR OF "THE BOOK OF THE DRY FLY").

In Three Parts—Part I.

THE originator of dry fly-fishing is unknown. The credit of first popularizing it within a limited circle of South of England fly-fishermen has been claimed for several anglers. Mr. P——, who has been fishing for trout for getting on now half a century, believes that he took trout with the single floating fly somewhere about the beginning of the 70s. His view is that to no single known individual can be justly assigned the invention, the patenteeship, as it were, of the dry or floating fly. I find that several other fly-fishermen, who have been angling in the same parts of the country for trout for forty or fifty years, share this opinion. Observing the rapid spread of dry fly-fishing from one or two Hampshire chalk streams to waters of all descriptions, and in all parts of Great Britain, and even to continental waters, I am scarcely surprised to see that Mr. A. N. Cheney predicts that the method will be practiced by and by in America. The rivers really adapted to the

A FORT PIERCE TARPON.
Taken by Mr. F. M. Tylor.

dry fly are those of a slow or moderate pace, in which the water is clear and the fish are of a good size, accustomed to take natural flies of various sorts at the surface and in the sub-imago or imago stages of existence. If you have such waters in your grand sporting land, and if your brook and rainbow trout rise well at the fly, I can hardly doubt that the dry fly will presently be known in America almost as well as it is in this country.

It is practically out of the question to try to explain to fly-fishermen by writing or word of mouth the method and the distinctive character of dry fly-fishing without bringing in the ordinary or wet fly method. Broadly speaking, the wet fly angler fishes the stream, where the dry fly angler fishes the rise, by which I mean the rise of one particular trout which he has observed feeding on natural flies in sub-imago or imago form on the surface of the water. The dry fly angler nearly always, certainly always where he can, gets well below his trout, and casts his fly up to it; he never uses more than one fly; he never, if he can possibly help it, lets that fly be out of sight; he strikes directly he sees the rise or sees the ring, never waiting till he feels the fish; he does not fish at all unless he finds a trout or grayling feeding at the surface. None of these rules are followed by the wet fly-fisherman, and this fact will, I think, help to show the wide essential difference between the two styles, and to give besides, what is more to my present purpose, some idea of how the dry fly is used.

The first thing which the angler has to do, after he has reached the water and fitted together his rod, is to find a fish on the move, and taking, or obviously ready to take, food at the surface. On some rivers one cannot but help notice that there is a fairly steady hatch of fly and rise of trout throughout the day. Except in the burning summer afternoons where no fly to speak of hatches, and when the fish seem to prefer either basking in the sun or else hiding themselves in the weeds, I have observed that these rivers are usually the smaller ones, such as tributaries of tributaries, with plenty of fairly rapid water.

Having discovered his rising trout the angler proceeds to get well behind it, more especially if the trout is situated on his own side of the stream. Sometimes he sees the fish more or less distinctly; at others only the ring which the fish makes in taking the natural fly. If only the latter, it is necessary to fix as closely as possible upon the exact spot where the rise is taking place. When a trout only rises once in or near the middle of the stream, and does not remain in sight, it is difficult for the angler to keep the exact spot in his eye, or mind. On the other hand, when the trout rises close in under the bank, or in a particular eddy, small pool, or the like, the angler is easily able to mark the spot. A single blade of grass, a stationary break in the water—if I may use such an apparently conflicting term—the overhanging twig of a willow, or some other similar object, will serve the purpose. Yet in order to feel perfectly sure of exactly where the trout is, the wise angler will usually wait to see a second rise before he commences operations. A good trout taking natural flies at the surface will move only a very little, rarely going more than a foot to the right or left of his lair to seize an insect floating down stream. Often the trout will not stir so far as that, but will prefer to wait and suck down only the flies which come over his very nose.

In this style of angling the more the angler can imitate nature the greater will his success be. The natural fly floats down stream with, if it be, as it usually is in the case of English "dry fly waters," one of the ephemera, upright wings. It is therefore necessary that the angler should make his fly float down with upright, or in dry fly parlance, "cocked" wings. To make the fly float the angler must prevent it getting water-logged. Therefore, after withdrawing the fly from the water after an unsuccessful cast, he has to shake the water out of it by a backward and forward motion of the rod in the air, usually over his shoulder. This process is known as drying the fly.

The actual cast should be so made that the fly will fall from 6 in. to a foot above the rising fish, or above the point where the ring, which tells where the fish is waiting for its prey, has been observed. It should then be allowed to float down, and if not taken should still by no means be removed from the water till it has traveled a foot or even 18 in. below the point where the fish is known to be lying. If removed too soon it will very likely scare or "set down" the fish for an hour or more—i. e., cause the fish to cease feeding on the natural fly. Delicacy of cast is by no means only essential to dry fly-fishing; from time to time for a long while past angling writers have laid stress upon the necessity of letting the flies fall "like thistle-down" on the water. But, if it is necessary in wet fly-fishing, it is assuredly not less so when the dry fly is being used. If the fly fall heavily on the water it will soon get drowned, perhaps before it has traveled its few necessary inches; and the trout will not under those conditions deign to even glance at it. Accuracy of cast is, if possible, more absolutely necessary than lightness of cast. Let a cunning old trout see too much of the gut, or let the fly fall wide of the mark at the first cast, and success is always unlikely. Therefore the angler should measure the distance nicely, and not let his fly alight till he is tolerably sure that he will be able to place it in the right spot. Hurry in dry fly-fishing is as fatal as it is in deer stalking. It is quite true that there often seems not a moment to lose during what the angler knows to be a short, sharp rise of fish and hatch of natural fly, but still it is far better to err on the side of deliberation than precipitation. The thing is never to hurry, and yet never to lose a moment, but then that way lieth perfection.

New England Fishing.

BOSTON, April 13.—Landlocked salmon fishing at Sebago Lake in Maine has been unusually good since the ice went out. Thirty-five salmon were caught there Saturday and Sunday, and ten or twelve on Monday. One of the largest, caught by C. E. Davis, of Portland, weighed 12½ lbs. One or two good fish have been taken by Boston fishermen, and they all unite in praising the fishing there. Charles A. Robinson, of South Windham, a gentleman thoroughly posted on salmon fishing at Sebago, telephoned John G. Wright, of this city, on Thursday to look out for a 12½ lb. salmon that was on the way to him. This fish goes to just the right place, since Mr. Wright has been prevented from making his usual fishing trip to Sebago this spring by illness. With Mr. Robinson he has fished there every spring for a number of seasons, and may go later.

The members of the Sebago Club are off to-day for their delightful sporting camps at that lake. The party includes Mr. Gookin and friend, Mr. E. Harding; Mr. Sias, Mr. Mitten, Judge Bolster, Mr. Paine, Mr. Fitch, Mr. Lawson, Mr. Henderson and Mr. Fisher. The gentlemen are all fond of fishing; several of them are salmon experts, and some good catches should be recorded, though the latest reports suggest that the fishing has not been as good for a day or two as on the first days after the departure of the ice.

Some good catches of trout are noted from Wheeler Brook, in and near Byfield. Senator Charlie Bailey and C. H. Tarbox fished there a few hours on Saturday, with the result of five trout for Tarbox and six for Bailey. Two or three of the fish measure 10 in. in length. This is considered very good indeed for brook trout in Massachusetts. The brook is controlled by the land owners around it, and is thoroughly posted. Restocking has been done to some extent, and the fine fish taken this spring are believed to be the result of restocking and protection.

BOSTON, April 18.—Cold weather has kept the trout fishermen at home for two or three days, but later the skies are bright, and good catches are looked for on Patriots' Day, April 19. The ice did not get out of Newfound Lake, N. H., till Thursday, according to telegrams, and the R. O. Harding party did not start till Saturday. They expect good fishing. At this writing the ice is still in Winnepesaukee, though expected to leave at any moment. Considerable preparations are being made at several points on that lake for the entertainment of fishermen, who troll for lake trout. Lake Auburn, Me., is clear of ice, or will be by time this item is read, since the coves were clear, according to reports last night,

A good run of salmon is looked for there, since some of the largest on record were taken and stripped last fall at breeding time. The Commissioners also noted a greater number than usual at that time on the spawning beds. Moosehead is expected to clear of ice early this year, to be in keeping with the waters of the southern part of the State, but still the woods are full of snow in that part of the country, with freezing weather nearly every night.

Fishing at Sebago Lake has been even better than at first reported. On the whole more salmon have been taken than ever before for the same length of time, and though there was a lull in the fishing for two or three days last week, still the persistent fishermen were getting two or three fair fish each day. The milder weather of to-day is expected to start the fishing again. The greatest success has been found at "The Bar," so called, not far from the mouth of Muddy River. Fully fifty fine salmon were taken there in one day—Tuesday last. Mr. R. P. Woodman, than whom there is not a greater salmon enthusiast, returned the other day with a score of seven handsome fish, the largest weighing 8½lbs. He is greatly pleased with his success, but kindly attributes a good share of it to his guide of many other seasons, Kit Shaw. Mr. Woodman says that Kit will work all day, if there is a salmon ready to bite, and be very sure to put his man "on to him." Immediately on finishing for Mr. Woodman Kit was placed in charge of two more Boston fishermen, at Mr. Woodman's instigation. They will also stop at Crocket's, which point is proving to be the best for fishing this year. On his way out, and they on their way in, Mr. Woodman met the members of the Sebago Club already noted, fourteen of them. Mr. Fisher, of that party, asked him "What luck?" "Seven fine ones," answered Mr. W. Instantly his words were caught up with a shout by the rest of the party, and went through the whole car.

Judge Hobbs, a former fishing friend of the late Judge Virgin, of the Maine Supreme Bench, has taken the biggest salmon at Sebago so far this year; and everybody is glad of it. The Judge declares that the fish "pulled like a heifer and jumped 9ft. out of water several times." Dr. Brock, of the Maine General Hospital at Portland, has taken a 10lb. salmon, and his friends are congratulating him.

The "specimen" sent to the Boston Athletic Club by Guide Douglas, of Kibby Valley Hotel, last week, proves to be a loon instead of a bear. The writing was mistaken. It got blurred somewhat, and it was easier to read "bear" than "loon." But the club is much pleased with the specimen, however.

SPECIAL.

Two Thousand Miles for Three Days' Fishing.

BALTIMORE, April 13.—O. K. Chobee's letter in your issue of April 9 reminds me to report to FOREST AND STREAM. I left Baltimore with a friend Saturday, April 2, for Florida, and we arrived at Fort Pierce on the Indian River Sunday afternoon—241 miles south from Jacksonville. Fort Pierce is a short distance from Indian River Inlet, and here the best fishing on the river can be had.

Monday rain interfered to some extent with our fishing, but as we had traveled 1,000 miles for a few days' fishing we didn't scare a bit for the rain. The wind blew a gale and the sea trout were hungry. The sailing and fighting the trout of 6 and 10lbs. on an 8oz. rod were exciting, and the boat surging along over the whitecaps lent additional zest to the sport. Tuesday and Wednesday were a repetition of Monday's catch with the exception that on Tuesday we went to the inlet and interviewed the red snapper, otherwise greased lightning.

This day my friend J. C. S. fastened on a channel bass of 20lbs., which seemed in the humor to carry away 300ft. of line, rod and reel. He, however, stopped the fish, and after a fight of twenty minutes brought him to gaff. My friend's efforts to stop him furnished me with much amusement, and I concluded I did not want any of that in mine. "Wait," said J. C. S. "He laughs best who laughs last." But the best of the fun that day was when he interviewed the red snapper. Whiz! sang his reel. "Stop him!" cried the boatman. "Stop the devil!" said J. C. S. "Can't stop greased lightning." And he didn't. The fish started shoreward, fouling the line on some mangrove roots and parting it. I didn't dare laugh, for he tips the scale at 20lbs., and the water was too deep for wading.

Wednesday he had the laugh on me. We had been out but a short time, the wind blowing fresh west-north-west, when I had a wicked strike. "Tarpon," said the boatman. Away he went, 200, 300ft. "Stop him!" "Can't do it; the line on the reel burns my thumb; see the smoke from it." I finally checked him so far as to enable me to get control of the reel. "What is it?" I asked of the boatman. "Young tarpon," he replied. "Can't be," I said; "he did not leap when I struck." "Channel bass," said J. C. S. "You now have some of my meat. What are you mad about? Bring him to gaff. Don't fool away your time."

Away he goes again, 200ft.; and we follow with the boat. I finally bring him to gaff after thirty-five minutes of hard fighting—27lbs. of channel bass and a ton of mad fish. "I don't think I ever saw you real mad before," said J. C. S. "How do you like it? Do you want more of the same?"

Now I acknowledge I was a little "riled," because he had the laugh on me. "No," I said, "if I strike another steam engine I will cut my line if I can get hold of it."

Half an hour later I had another fight with a 20lb. fish of the same kind. The fighting quality of the channel bass is not equal, pound for pound, with that of the sea trout. They make many fierce runs, and are difficult to control with a light rod, like the one with which I was fishing, and with a sea in whitecaps, but taking it all in all I have never had the sport discounted in an experience of fifty years' angling. Remember too that this was my first experience in salt-water fishing. Heretofore my angling has been confined to fresh-water brook trout and black bass (small mouth), with very few

exceptions in my early youth. We returned home well pleased with our sport and success, with a new skin on cheeks and nose, especially the nose, and were rated as fishing cranks for traveling 2,000 miles to get three day's fishing. Well, well, every man has his hobby, and we took a long journey because we didn't want to ride our hobby to death.

Now something of Fort Pierce. We were domiciled at the Fort Pierce Hotel with Mr. Frank M. Tyler, one of the best of hosts. Mr. Tyler will not only take especial pains to make you comfortable and feel at home; he will feed you well and exert himself to have you provided with good guides for hunting and good boatmen for fishing. Mr. Tyler is a fisherman for tarpon, and his prowess is evidenced in a mounted tarpon of 5ft. 6in. and a register of many others. There is a record of twenty or more, giving size and weight, as also by whom captured, during the season of 1897, which record is placed on a blackboard in the hotel office.

The Gulf Coast cannot claim all the sport, if sport it be, attending the capture of the "silver king." The method of capture on the East Coast differs from that on the Gulf Coast. On the East Coast they do not "still-fish." They troll, and the fish does not swallow the bait and hook, as is the case on the Gulf Coast; the fish is hooked in the mouth, requiring greater skill in bringing to gaff, and in consequence many more escape than are captured. Nor do they fish with Mr. Joe Jefferson's "billiard cue" (vide Brother Cheney). It seems to me the method employed on the East Coast is more sportsmanlike and to be preferred to that of the Gulf Coast, premising that I cared to fish for tarpon; but I freely confess I haven't any hankering that way. I wouldn't like to be towed all over the ocean coast at night—no, nor in daylight—by a big brute of a fish. In such circumstances I would cut and run.

E. S. Y.

Fresh-Water Angling.

No. III.—Brook Trout (Concluded).

BY FRED MATHER.

THERE is no fly-fisher who is so free from anxiety as the angler who is seated in a boat upon a lake. There are no overhead bushes to either detain or snatch a fly from his line, and but few sunken logs or limbs to look out for. With a freedom from anxiety there is also a large batch of personal comfort in the absence of wet feet and the other traditional features of fisherman's luck, as well as freedom from too much physical exertion which just suits a lazy man, such as I claim to be. There are many good people who revile a lazy man, but the lazy man usually finds it too much trouble to say, as I do, that a busy, bustling, nervous man, who always wants to do something when there is no need to do anything, is a nuisance of the first water in camp. To him action takes the place of thought, and he has no pleasure in contemplation of nature in her moods and tenses, and therefore has no poetry in his soul. The lazy man may not be the most successful hunter, fisher or business man, but his compensation comes in getting more enjoyment out of life than the hustler who is worn out before he has had time to reach middle age.

Trouting from a boat on a lake is, to me, the very poetry of angling. It is a compromise between the almost lethargic angling of the Waltonian school, which was content to sit all day in hope to see "his cork go down," and the ferocious fisher of to-day who seeks to break records and is willing to tramp through miles of streams to do it. Fishing records are a modern abomination; they are supposed to measure the amount of pleasure that an angler has had when he answers the question, "How many did you get?" or "What was the biggest fish you ever caught?"

Communing with Nature.

To the man who loves to commune with nature these questions do not enter into his calculations. Angling is merely his excuse for an outing, and the lazy man is the one who takes time for such communion and is not worried for fear that his catch will not be as great as that of some other man. He is not afraid, nor ashamed, to say that his catch was very light, but with the mental reservation that he had a most pleasurable day. The Apostle was not ashamed to say: "We have toiled all night and caught nothing." There is no disgrace in this. If the fish are not there, or are not feeding, the best of anglers cannot make a large catch, and the fact that the largest fish ever taken from a certain water was taken by you does not crown you as king of all the anglers, and is not a thing to boast of, for it was an accident. If you had not been there at that time the fish would have been taken a few days later by another angler, and you are entitled to no particular credit for taking the largest fish, and its capture does not place you on a pedestal where you are to be admired as the greatest of anglers. Remember it was merely your luck.

It is not all of Fishing to Fish.

In my book, "Men I Have Fished With," I credited the saying, "It is not all of fishing to fish," to the late George Dawson. Its origin has been disputed, but the saying will live as long as it deserves to do. The busy angler who fishes from the time he can see in the morning until he can't see at night may be fond of fishing, but misses the best part of it; he keeps count of every fish, and knows the exact number in his creel, but he does not see the wood duck go to her nest in the hollow tree, the mink prowling on the shore, nor does he hear the wood pewee nor the tap of the woodpecker; to him the fishing is all there is of it.

Lake Fishing.

Seated in a comfortable boat on a mountain lake is my favorite form of trouting. No boatman is needed, at least not by me; but with light oars which have an iron swivel, or dowel, which fits into a hole in the gunwale, so that the oars may be dropped and hang by the side of the boat when not in use, one can do the little rowing necessary while casting.

In spring and fall, or while the water is cool, the trout

may be found near the shore, and it's a good plan to row up against the wind and let the boat drift down, using an oar now and then to keep in or off shore, as needed. Keeping about 60ft. from shore and casting toward it at different distances, or wherever the trout are rising, is a good plan if the wind is not too strong to allow careful fishing. If the boat goes too fast, for it should drift gently, an anchor must be dropped while the water near and far is fished; then lift the anchor just clear of the bottom and drift into new water, steering with one oar or both.

In this mode of fishing it is best to cast in semi-circles, beginning at 20ft. and casting up or down the lake, making casts 10ft. apart on the half circle and then reel off more line and cast 30ft., and so on until the water has been covered, unless you see where a trout is rising, when it is well to cast near that spot, not necessarily into it; within a few feet will do, for the chances are that the fish did not go straight down, and the angler may often see which way it headed and make the cast where the fish is supposed to be at the time.

Spring Holes.

Most lakes become too warm near the shores and on the shallows in May or June to be comfortable for brook trout, and then they do not care to go to depths of 60 or 80ft., as the lake trout of the Great Lakes and the Adirondacks do. It is cool down there, and in the lakes mentioned it is my belief that the brook trout know that their monstrous relatives dwell in those cool depths and would take the largest of them in and out of wet if they only had a chance. At any rate they do not go there, but congregate about the springs which come into the bottom of the lakes in shallower water, say from 8 to 15ft. deep, where they find a temperature to their liking, food, and light enough to see it.

To know the spring holes is to know the lake, for it is seldom that there is any surface indication of their existence. Usually the spring bubbles up in a hundred or more small boiling points, which just lift the sand and keep it clean, but with no central spout strong enough to ripple the surface. Here the trout must be approached warily.

A "dry fly" would be useless in a spring hole. I doubt if a trout can see an ordinary fly and distinguish it as a fly, if it is looking up through 15ft. of water when there is a ripple on the surface. If it can distinguish it the trout will not rise to the surface for it. Possibly the knowledge that the surface water is warmer may influence the fish, but I prefer to think it a question of vision, for a trout cannot see far, and by far I mean to say that it cannot see 50ft. straight ahead in the clearest water. True it will take fright at a splash in the water beyond that distance, but a splash may be heard or felt by the trout. Yes, a trout can hear a sound made under water, but can't hear a fisherman swear. I have no time nor inclination to go into this question, which has been argued at length, and will let the assertion rest.

Therefore spring-hole fishing for trout is an art by itself. Approach the spring hole carefully. Anchor to windward, so that you may drift down on it, but stop away off. If you know that this particular spring sheds its coolness over a circle of say 60ft., stop at about that distance from the circumference of the circle; cast toward it a few times, and if there is no rise move a few feet nearer by lifting the anchor and dropping it again; not by a plunk as if you were bobbing for eels, but as described above.

If the spring hole is over 10ft. deep, put on a split shot just above the tail fly and cast, working the fly after it has sunk about 2ft. Cast to right and left, and if a fish is hooked keep it from getting to the center of the pool at all hazards. Lead it around to the other side of the boat and fight it where it will not disturb the others, and so proceed to fish the spring hole in a systematic manner.

Never make a cast into the center of the pool until you have fairly circled it and picked off a few trout from the outside, because a trout that is hooked in the center of the pool, and fought there, may be the only one that you may get from it. To alarm a trout has the same effect as alarming any other animal; it becomes cautious.

Split shot can be bought of all tackle dealers, and in different sizes. They are readily closed on a leader by the teeth or a tap with a pocket-knife. They are a necessity in fishing spring holes, but not in other trout fishing. I don't like them, but when trout are in deep water and will not come to the surface for a fly, it is the old problem of Mahomet and the mountain.

The Number of Flies to Use.

On a 9ft. trout leader we often start in with three flies of different colors, the tail fly and two droppers; the last one is sometimes called the hand fly, because it is nearest the angler. The tail fly is an extension of the leader, and while that is sunken and moved in the water like a swimming crustacean or water insect the droppers being pendant from the leader are playing on the surface like an insect occasionally touching the water to lay its eggs, a process known as dapping.

I have said that we often start in with three flies. Some anglers never fish with less; and many a night have I lain in camp and argued the question of one fly or three. My own choice is for only one, but it is fair to present both sides of the case, and we will.

Years ago I fished and camped on an Adirondack lake with the late James Geddes, of Syracuse, N. Y., of whom I wrote as one of the "Men I Have Fished With" in FOREST AND STREAM of Oct. 16, 1897, and he said: "I tell you that a 'dropper' playing on the surface is more attractive to a trout than the drowned tail fly. It is more like what Reub. Wood describes as dry fly-fishing, which he practiced in England, than our ordinary fly-casting. The movement of the living insect is counterfeited, and with the right colored droppers the trout prefer the droppers. Your old friend Nessmuk, whom we rescued from a watery grave last night*, had a worm on his tail fly, but none on the droppers, and I think that he is an authority on the subject, and that you don't know a little about it. Now what have you to say?"

* See FOREST AND STREAM of Sept. 25, 1897.

"I have this to say: Nessmuk is an authority on woodcraft, but to quote him on fly-fishing is a new proposition. When he was not near anglers any kind of bait that would take trout would serve his purpose. He was a part of nature, but somehow his sentimentality did not take the direction of trout fishing—more's the pity."

"Well, what has this to do with the question of hand flies?"

"Nothing further than to refute your assertion that our old friend Nessmuk was an authority on fly-fishing. I will concede him an intimate knowledge of camping, light canoes, and knowledge of the woods, but at fly-fishing he could hardly rank as a duffer, for he did not practice it. He fished merely to get meat, and he loved the woods as few men love it."

"Well, well, we will admit all that. Go on and present your case for a single fly, and that a drowned one on the tail end of the cast. I'm a sinner if I can see where you have a leg to stand on."

"My dear Jim," said I, "the tastes and fancies of a trout are various. On a stream or lake you may present three flies to at least 10,000 trout which are lying below. They all see them, but they only attract about fifty fish; figure the percentage for yourself. Of that number about twenty take the fly and are caught, the rest miss it. Of these twenty at least fifteen are taken on the tail fly, if it is the one which has lured the most fish either in its present position or as a hand fly."

"No, I object," said Mr. Geddes. "In this argument there must be no shifting of a favorite fly from a dropper to a tail fly."

"Then we must bind ourselves to keep a fly in a certain position," I replied, "and that would kill my practice of putting the favorite as a tail fly and abolishing all others. In my experience the tail fly, if properly selected as a killer for that day, will take more trout than any other fly on the leader, because it is sunken and resembles a swimming thing, perhaps a gammarus or other crustacean, or some swimming beetle or fly, or, as I think more likely, the trout does not think about it nor mistake it for anything which it ever saw, but just snaps at it on general principles, just as a puppy will grab at a toad because it moves and then drops it when the toad burns his mouth with the secretions from its skin. Usually one lesson teaches the puppy the difference between the acrid skin of a toad and that of the harmless frog, but the trout pays for the mistake with its life, while the puppy froths at the mouth like a boy who has bitten an Indian turnip, and gets over it sooner."

I can't believe that a trout is an entomologist who casts his eye aloft at the imitation insect, and thus soliloquizes: "That moving thing cannot be a May fly; its tail does not cock up enough; it is probably not one of the ephemera, but may be some species of Phryganeidae which I do not know, and I'll sample it and try its flavor."

If any of the "natural school" of fly-fishers who believe in copying the natural fly thinks that a trout reasons in that manner, and it pleases him to think so, we will not quarrel about it, but he would need to argue long to make me think so. In my first article I merely intimated that I had no belief in trying to imitate natural flies, but will now say that I have a belief on the subject, and that belief is that a trout will take a nondescript fly as quickly as any, if the fancy strikes the trout to seize it. It is an impulse that is acted on at once and is not reasoned out on entomological lines, just as I have slapped down a beetle which came too near before I ever thought of striking at it. I struck first and thought afterward, and I believe that a trout does the same.

If every trout that saw the angler's fly rose at it there would be no trout left. It is only the occasional fish, say one in a hundred, which rises to the cast, and of this number there are many which miss.

A Trout Rises in Play.

Many of the misses seem plainly intentional. I have seen the same trout rise several times at the same fly, cast after a few moments' rest, and miss it every time. The trout is a fair marksman, and while it may miss a moving fly occasionally it will not repeat the miss many times. Why then does it so often rise and miss? Play, my boy, play; only this and nothing more. Most animals play, why not the lively trout?

Some years ago, a subtle humorist, perhaps Charles Hallock, started anglers to arguing over the question whether a trout did not strike a fly with its tail and flip it into its mouth. The question was taken seriously, and as we have all seen a trout come up in play and toss the fly in air with its tail there was quite a lot of fun got out of the arguments. Verily the funniest thing is not a frog, although he has the reputation of it.

Doubles.

The reason why I wish to learn which fly is the most killing and then to fish it alone as a tail fly is a dread of doubles. I would prefer to fish for an hour without a rise than to hook two trout at once. It may happen if you use more than one fly, and that is why I prefer to fish with only one if I can hit on a fair killer for the day. The favorite of yesterday stands small chance today if the weather conditions differ, or if they do not. Woman has been charged with being capricious; in my limited experience I have not found her so, but if there is a living thing on the earth or the waters beneath that is fickle in its fancies it is a trout. With two trout on the same leader there is no yielding of the rod between them, nor giving of line which saves the day in the savage rush of a lusty trout when there is but one to handle. With a double there is danger of both jerking in opposite directions at the same instant, and then something may give way or so strain the gut that it is weakened.

When the angler is so unfortunate as to hook two fish at the same time he must be patient and humor them until they are tired enough to reel in, trusting that one may unhook itself or that they may not jerk at the leader simultaneously. If, however, they are brought near enough to net, be very careful; get the net well under the furthest trout and then take the other, but never try to net the near one until the other is in the net.

Unlucky Strikes.

Worse than a double is a trout that strikes at the moment when you are recovering for another cast. Of course it can't be prevented, and so I call it unlucky. Such a strike may break anything from a snell or a leader to the tip of the rod, and it happens to the best anglers. If the trout is a small one it may be snatched out of the water and over the head of the angler without breaking anything, but it puts a strain on tackle which does it no good, while if the trout be of good size there is sure to be damage.

Chuck and Chance.

This is a term of derision devised by the sticklers for imitations of natural flies, to be hurled at the heads of anglers of my class who do not care whether a fly imitates anything that lives or not, as long as a trout will rise at it. We are "chuck and chance" anglers, and if the term pleases them it pleases us.

What is there to do but to chuck and chance? Note the beautiful alliteration. We go to the lake or stream and "chuck" three different flies; if one or more by "chance" proves acceptable, there we are. If, however, the trout will have none of them, we change flies and "chance" again and again until we hit the right fly. Some have a rude formula which prompts them to use dark flies on a bright day, light-colored flies at evening, but others reverse the rule.

This mode of chance the "natural fly" man, who is much more common in British waters than here, contemptuously calls unscientific. In his fly-book there are no nondescripts, such as the red ibis, queen of the water, and other flies which have no resemblance to living insects, and therefore should not be used to lure trout, but he has all the so-called imitations of insects which ever by accident or design appear on the surface of the water, and he believes that they are really imitations; a faith which requires a strong imagination behind it. He approaches the water in a thoughtful and observant mood. He satisfies himself as to the kind of fly, or flies, which are hovering over the water on that day, and if the trout are rising at them he searches his book for an imitation. If he has nothing which satisfies his aesthetic mind he catches one of the flies, counts the hairs on its off hindleg, and producing materials from his kit he proceeds to tie what he thinks to be an imitation of the insect, and having wasted an hour at this work begins to cast, and if he takes a few brace of trout with his fly he is satisfied, and flatters himself that no other combination of fur, wool and feather would have taken those trout. He is perfectly satisfied, and why should not we, the "chuck and chance" men, be satisfied?

My dear brother of the angle, if the "natural fly" angler will permit me to so address him, there is not the slightest objection to your methods nor to your nursing of pet theories. You may be a trifle cranky, but you are a good fellow after all; you are entitled to respect because you are sincere. We, who cast the derided nondescripts, are as sincere as you, and if we choose to begin casting in what you deridingly call the "chuck and chance" manner, why is not our sincerity entitled to as much respect as yours?

I don't pretend to see with the eye of a trout nor to think with its brain. Just what insect the trout may think, if it does think, my fly may be is a matter of perfect indifference to me if the trout decides to take it. A fly in a tackle store may look to the buyer very different from its appearance to a trout who sees it wet and sodden through 6 ft. of water, against a sky which may be white, gray or blue.

These are radical views, but in the first article I declared myself a Philistine on the fly question, in order to anticipate the charge, if it should be made. Most anglers, especially American anglers, use more nondescript flies than the alleged imitations, and by the word "alleged" I mean to assert that the imitations may serve to deceive a trout which is lying in three or more feet of water, but to me have no resemblance of an insect. Take a "palmer," or "hackle," as it is often called; would a child of ten years old ever mistake it for a caterpillar? Never in the wide, wide world. And so it goes; the imitations of natural flies are, to my eye, most imperfect imitations, and sometimes they are killers and at others the trout will have none of them, but prefer some gaudy nondescript, and if they do I indulge them in their tancy and "chuck for chance" without a bit of respect for traditions, or the rules laid down that certain flies are only to be used during certain months, or any other rule which I may consider nonsense; but then I am a Philistine, and what can you expect?

Hockhocks and Pine Brooks.

PATERSON, N. J., April 14.—*Editor Forest and Stream:* Permit me to say a few words in regard to the complaint made in your last issue by Mr. Leonard Hulit, to the effect that streams recently stocked by the State were unlawfully posted by a deputy warden. Shortly after the streams in question were stocked an application was made to me by Deputy Brown and others for notices prohibiting fishing for three years; I replied that no such notices were used, as the law prohibiting fishing in stocked streams for three years applies only to streams when first stocked. When I was informed that notices had nevertheless been posted by Mr. Brown I had the matter investigated, and I learned that about one-eighth of a mile of the stream was posted by a well-known lawyer of Long Branch, who was anxious to protect the fish against pot-hunters, but who never objected to sportsmen indulging their sport with rod and line. Every property owner has the right to prohibit trespassing at all times, and if I am correctly informed nothing further was done. I am led to believe that Mr. Hulit was misinformed as to the extent of the posting. The State Commission certainly never has prevented fishing in streams because they had been recently stocked.

CHAS. A. SHRINER.

The FOREST AND STREAM is put to press each week on Tuesday. Correspondence intended for publication should reach us at the latest by Monday, and as much earlier as practicable.

ANGLING NOTES.

The Pikes.

A GENTLEMAN in Pennsylvania sends me the following questions: Being very much interested in a controversy in which the mascalonge and pike have played an important part, I thought I would write and get your opinion on the following questions:

First—Is the true mascalonge (*Esox nobilior*) found inhabiting Chautauqua Lake?

Second—What is the most marked difference between the mascalonge (*Esox nobilior*) and pike (*Esox lucius*)?

Third—Do these two species of fish ever cross?

Fourth—What is the average weight of the pike (*Esox lucius*) in this country?

Replying to these questions in their order:

First—The mascalonge is found in Chautauqua Lake, and is propagated by the State of New York artificially. It is, however, no longer known by the scientific name *Esox nobilior*, as according to Jordan & Evermann's classification it is *Lucius masquinongy*, and the pike, formerly *Esox lucius*, is now *Lucius lucius*.

While the Chautauqua Lake mascalonge is not colored like the St. Lawrence River fish, it is structurally the same, and this is also true of the Wisconsin fish in comparison. The Chautauqua fish, instead of having

PICKEREL.
Cheeks and opercles completely scaled.

round brown spots on a light ground, has splashes of brown, quite irregular in shape, on a light ground. Occasionally these marks are nearly round, some of them on some specimens. The Wisconsin fish, like the Ottawa River fish, is unspotted, but they are all true mascalonge.

Second—The most marked difference, perhaps, that is constant is the scales on cheek and gill covers. In the case of the mascalonge the scales cover the upper half only (generally about eight rows of scales) of the cheeks and gill covers; while in the case of the pike the cheeks are entirely covered with scales, and the lower half of the gill covers is bare the same as the mascalonge. The coloring of the pike is more constant

PIKE.
Cheeks scaly. Lower half of opercles naked.

than the coloring of the mascalonge. The pike of this country and Europe are the same, and always it is found with lemon-colored, bean-shaped spots on a darker ground. Within a year, I think, FOREST AND STREAM has published cuts of the scales of pike, mascalonge and pickerel on cheeks and gill covers in a manner to show the difference beyond a question.

Third—No; not in nature. It is man that makes mules, and up to this time man does not appear to have thought of making a hybrid pike, but he may when he does think of it, in which case we will have a fish that is not as good as either parent.

Fourth—It is difficult to give the average weight of pike in this country, but probably from 4 to 15 lbs. The largest I know of being taken came from a lake in

MASCALONGE.
Lower half of cheeks and opercles naked.

Pennsylvania, and weighed 35 lbs. A pike of 56 lbs. was caught in Ireland. I mentioned this fish, at the time of its capture, in this journal; and several times since that time lists of big pike have been printed in the English papers, with never a mention of the 56 lb. fellow. Very recently I read a letter from a gentleman who gave the details of the capture of the fish in question, and now I presume it will be included in future lists printed in England. Some years ago—I cannot give the date—FOREST AND STREAM published in connection with my notes a half tone of a pike caught in Lake George, N. Y., and it was one of the best pictures of the fish I have seen, and it was because the

markings of the fish were so plainly shown that I sent it in for illustration.

Pickereel.

There is a clipping on my hook which fits in right here. Some one sent me an article from the New York Sun descriptive of fishing in Florida, and in the article is this: "The pickerel of the Ocklawaha are big fellows too. They are exactly the same as the chain pickerel of the North (*Esox reticulatus*), but they are so black that the reticulations are hard to find until the fish have been out of the water some time. From 4 to 6lbs. is ordinary weight, and 10 to 12lbs. something to boast about."

This man writes as though he were perfectly familiar with his subject, and *Esox reticulatus* is the chain pickerel all right enough, or it was until its name was changed to *Lucius reticulatus*; but the weights, 10 to 12lbs., are what make us gasp for air. The maximum weight of this fish was heretofore supposed to have been about 6lbs. in very exceptional cases, and the average from 1½ to 2½lbs. The Florida pickerel has been described under another name, *Esox phaleratus*, and its southernmost limit is Crooked Lake, Orange county; but Jordan says there is no difference between *phaleratus* and *reticulatus*, and gives the maximum length of the species as 24in., and a 24in. pickerel will not weigh anywhere near 10 to 12lbs. It is true that the writer in the Sun does not declare that the pickerel of the Ocklawaha do weigh 10 to 12lbs., for he says those weights are something to boast of; but I do not imagine this is said in the same sense that a man would say that a brook trout of 25lbs. is something to boast of, knowing that there are no brook trout of that weight. We must assume, I think, that the writer intends to convey the idea that pickerel actually did grow to the weights he mentions in the waters he described, but I would really like to know whether this was scale or water weight; whether the fish have ever weighed 10 or 12lbs. on scales, or when seen in the water they were estimated to weigh over 10lbs. Will some one familiar with the region please enlighten us on this subject?

Scrod.

Another clipping came to the surface when I was fishing for the 12lb. pickerel on my copy hook, and here it is:

"The difference between broiled schrod and broiled fresh codfish is that the former is salted for about thirty-six hours before being cooked."

I protest against the spelling and the salting. I cannot now tell where the clipping came from, but probably, from its appearance, from some household receipt column in one of the daily papers, and the man who wrote it (a woman would have known better) was a farmer who may have been an artist at sheep shearing, but he was off on broiled scrod. First, as to the spelling. The Century Dictionary says: "Scrod (skrod). A young codfish, especially one that is split and fried or boiled (New England)."

The first broiled scrod was eaten in New York a good many years ago. I was in the habit of going to Fulton Market for oysters for luncheon, and I ate them at Dorlon & Shaffer's before ever Dorlon dreamed of a place in Twenty-third street. I went as usual one day, but I had rather tired of oysters, and as I met Dorlon at his stand I told him so; and he said take luncheon with him, and it would not be of oysters. When a covered dish was placed between us I was curious to know what was under the cover, and when I saw that it covered what I guessed to be a codfish I was disappointed, and expressed my disappointment, to use no stronger expression. Dorlon advised me to try the fish before finding more fault, and I have always regretted that I kicked before tasting the fish. He said that when I came into the market the codfish was alive, and had been killed and broiled while I sat at table. Since that day I have eaten the scrod where it was born, in New England, until friends have applied a name to me, and Scrod is part of the name. Within six hours of the time that I am writing this note I expect to start for Boston, and a friend, Mr. J. W. Burdick, that I am to meet on arrival, said to me: "We will go by different trains, but arrive about the same hour. Meet me at Young's Hotel, and we will have broiled scrod about 6ft. long for breakfast, and for luncheon we will have just plain broiled scrod of any size that it happens to come." Feeling as I do about broiled scrod, and that the young cod cannot be too fresh from the water for broiling, salting for thirty-six hours seems to me as much out of place as a salmon reel on a 50z. bamboo rod in front of the hand.

A. N. CHENEY.

Rare Waltons.

At the coming sale of the library of Hon. Francis B. Hayes, of Boston, says the New York Times, for the second time a complete set of Walton's "Angler" will be disposed of at an American auction, Bangs & Co. having sold Alexander's copies—the first so sold—in March, 1895. The "Angler" of 1653 is more sought after than are the other Waltons (though the second edition of 1655 is said to be rarer); but that is because it is the first edition. Alexander's copy, measuring 5-9-16 by 3-5-16, brought \$1,325, and £210 was given in London in 1892 for a copy that was 5-7-16 by 3-3-16 in size; £310 is another of the London big prices, while the highest of all, £415, was paid for a 1653 Walton, at Sotheby's, in December, 1896. Hayes' copy measures 5½ by 3½, and has been bound in full straight-grained morocco. The title has been rebaked and the dedication mended at two corners; folios 81, 83, 85, 89, 111, 155 and 161 have been repaired, and the margins of the music shaved closely by the binder, but otherwise it is a tall copy and in excellent condition.

The Hayes Walton of 1655 is in dark olive calf, by Bedford, and measures 5-9-16 by 3, Alexander's, which brought \$210, measuring 5½ by 3-1-16. Folio 117 has been mended and folio 203 repaired on blank margin. The music has been cut into slightly by the binder, and in places the headlines are nearly touched. At the Alexander sale \$150 was given for a Walton of 1661, which was 6 by 3½ in size. Hayes' is 5½ by 3½, and has been bound by Bedford uniformly with the preced-

ing edition. The back cover, however, has been rubbed, the last leaf of text mended, and a few words of the "Table" restored in fac simile. The Hayes Walton of 1668 is a fine copy, though the lower margin of the last leaf has been mended. It is in a binding similar to that of the first edition, and is 5½ by 3½. Alexander's two copies, measuring 5½ by 3-9-16 and 5-9-16 by 3-7-16 respectively, sold for \$95 and \$100. The Hayes copy of the fifth edition, 1676, is in green morocco, by Gosden, and measures 5¾ by 3-9-16. The first title is mounted and a very small portion of the word "printed" is cut away. The second title is reinforced at back. Alexander's was 6 by 3-9-16. It fetched \$90.

CHICAGO AND THE WEST.

The Trout Season.

CHICAGO, Ill., April 15.—The trout season opens to-day in Wisconsin, and here I am sitting at my little typewriter table writing copy, not doing my duty first instead of having pleasure, and not being up to the knees in the Prairie River instead of up to the eyes in work. Maybe things might have been otherwise if I had not heard that there was going to be a log run on the Prairie this week, so that the fishing will probably be better a little later.

The White River of Wisconsin is one of the best of the early streams in that State. It is lower down in the State than most of the well-known streams, and the trout there take the fly better early than they do later. The White is good for some heavy trout each season, and it is not an unpleasant stream to fish. Princeton is a favorite point of striking it. A great many Oshkosh men go to the White River, and among others who are reported to have gone there yesterday, so as to be on hand at 12:01 this morning, are Messrs. G. A. Buckstaff (the beagle lover, game law maker and representative in Legislature of the sportsmen of that section), Bert Hooper, John R. Evans, F. Challoner, G. L. Madison, Willis Minckler, Turn Chase, C. O. Josslyn, William Rogge and Dr. Russell. Oshkosh and Fond du Lac are fishing cities, and send out an army each spring to the trout streams. The Pine River is a favorite water also, and among others who start to the Pine to-day and to-morrow are Dr. Oviatt, B. Hooper, C. C. Chase, A. H. Goss, M. J. Peck, H. N. Clark, H. I. Weed and H. L. Battis, all of Fond du Lac, with Frank Favour, A. G. Gallinger, C. O. Sweet, W. E. Fildes, Thomas Baird, W. C. Kimball and F. Lampert. The Chicago men are usually later to make their start for the trout waters, it being very often the case that a party will prefer to combine trout and 'lunge fishing. It is further from Chicago to the trout streams than it is from Milwaukee or Oshkosh, and the sport at this season is so problematical that the average Chicagoan waits a bit before taking his chances. Still, I don't think that any trout ever tastes quite so good as the one caught on the first day of the season, just about thirteen minutes after sun-up.

Prepared.

The members of the Grand Rapids Fish, Game and Dog Protective Association have built a new club house on the Little Manistee, one of the loveliest trout streams that ever lay out of doors, and they will have a grand opening on May 1. The fly-casting tournament of this body, June 8 to 9, bids fair to be a good event, and already the members are getting together prizes for the competitions.

I do not remember whether or not I mentioned earlier the fact that the Flint & Pere Marquette Club, whose generous hospitality I sampled to my great edification last spring, has this season erected a fine club house upon the banks of their stream, Kinne Creek. This saves a little walk from the club house to the grounds. This trouting club is one of the very best in the West, and its waters are alive with fish. It has a membership of the selectest selection, and if they don't have fun over there about May 1 I give it up. Mr. W. B. Mershon, of Saginaw, offers to forward the tables of the catch, and I anticipate something a bit startling, for the trout in Kinne Creek at the first of the season are multitudinous and accommodating.

Question of Popular Right.

An old but still interesting question of popular right is up for decision in the Supreme Court of Wisconsin this week. Some years ago the Willow River Club, of that State, bought several miles of land along the stream of that name, which was stocked by the State and also by the club members, most of whom live in Minnesota. The club notified local fishers that they would not permit trespassers on the stream, but a good deal of fishing was done by parties claiming that under the law any stream was open which had been stocked by the State. Several suits have been brought, and the club has won twice in the lower courts, and once had a case remanded by the Supreme Court on technical error. The present case is against one Wade, and is brought by stipulation of attorneys of both sides. Its decision will be awaited with interest by local men, who claim that this water was of no value until the State put \$2,500 worth of fry in it, so that it became tempting to the club men who bought it up. As the club has planted much fry of its own, it may be difficult to tell which is a State fry and which is a club fish, but it appears that the local anglers want to catch the trout and get them into hand for a careful examination on this point. The court will have a nice point to settle.

Blown Up.

A curious case, the second of the kind which I remember to have seen noted, occurred out in Idaho this month, in which a man engaged in dynamiting fish was blown up by his own dynamite and killed. Mr. George H. Garrison, of Olympia, Wash., sends me the account, which was taken from the news columns containing a dispatch from Kendrick, Idaho. It seems that Henry James and two other men were dynamiting fish on the Clear Water, being out in a small boat. They had five sticks of dynamite, and James was the operator. He had exploded one stick and killed a number of fish, and had lighted the fuse on another stick. He saw some large

fish near the boat, and hesitating for a moment, allowed the dynamite to explode in his hand. His hand was blown off, and the rest of the dynamite was exploded, destroying the boat. James sank and was lost, though the other two men were rescued later, not so badly injured as to be unable to swim a little. This was not a very good way to die, but the enormity of the result overshadows any act preceding it, however ill advised or perhaps ignorant it may have been.

E. HOUGH.

1206 BOYCE BUILDING, Chicago.

The Angler and the Queen.

THE Balmoral water, lying between the Invercauld fishery at Ballater and the Invercauld water at Braemar, covers a stretch of some seven or eight miles in extent on both sides of the Dee, part of which belongs to her Majesty the Queen as proprietrix of the manor, and part of which she holds on lease from the adjoining lairds. The scenery through which the silvery Dee works its meandering, rapid, dashing course at this part, if not so impressively grand as that some miles further inland at Mar Lodge, is yet most picturesque in the extreme. In short, as the guide books say, "The scenery is thoroughly highland and very beautiful." The Balmoral fishery includes the Balmoral water proper, the Abergeldie water and the Birkhall section, all of which are at the command of Her Majesty's guests.

"Pol-manear" is a favorite cast near the castle, and was always held as the special preserve of the late John Brown, Her Majesty's personal attendant. John was an enthusiastic and inveterate fisher, and often the royal larder was indebted to his prowess for its supplies of spring salmon, when the rods of the other fishermen failed to bring them to the bank.

It is authentically reported among anglers on Deeside that when the Queen wanted John he was immediately at her call, but when angling; and at such times she studied not to disturb him. The tacit understanding between them is said to have arisen in the following fashion. Her Majesty one day sent an imperative message to the river side, desiring John to immediately wait upon her. "Tell Her Majesty," replied John in his usual Doric, "that I am rinning a salmon and I canna come." The messenger came back to him in hot haste, saying that the Queen desired to see him this very minute. "Well, tell Her Majesty this time that I am rinning a salmon and I wanna come." And that settled it.—Illustrated Sporting and Dramatic News.

Mohawk "Mullet."

DANBURY, Conn.—Editor *Forest and Stream*: Not having found out as yet what the Mohawk River, N. Y., fish is named that we call the mullet, I wrote to an old fisherman who resides at Crescent, N. Y., and lives on the Mohawk River, and inclose his letter. Please give the name of this fish in the *FOREST AND STREAM*, as the fishermen of Danbury are divided about equally in their opinion. Your decision in your paper will be accepted as final.

J. L. S.

CRESCENT, N. Y.—There are such fish as mullet in the Mohawk River, and plenty of them. We catch them with a hook and line, but have to use a very small hook. Just before dark they bite quite freely. The largest we catch weigh 5lbs. or upward. It is within only about three years that they have been caught here in the river, and it is supposed that they come from the lakes through the Erie Canal. I am acquainted with that species of fish; years ago I used to catch them at the Troy dam with a net in the Hudson River. DAVID F. SMITH, J. P.

[It is the mullet-sucker. The mullet-suckers, commonly called "mullet" in the interior, are coarse-scaled species, and in the Mississippi Valley they are called "red-horse." There are five or six species of them, and they range over most of the Mississippi system, the Great Lakes and New York, at least one species inhabiting the Genesee and Mohawk rivers. Their scales are so much larger than those of the common white sucker and the stone-roller as to be noticeable at once. Somehow they are not so plenty in the Hudson as are the small-scaled species. The small-scaled species are in the genus *Catostomus* and the large-scaled in the genus *Moxostoma*.]

The Mastigouche Waters.

THE angling territory controlled by the Mastigouche Fishing Club, in the Province of Quebec, will not be open to the public this year, since the members of the club have determined to reserve the fishing for themselves. This, however, does not of necessity imply that all anglers who have in the past proved the delights and rewards of Mastigouche fishing need be debarred from the preserves, since the club membership, we are advised by President Atwater, is not full.

In the notice last Saturday of Mr. Mather's entertaining book, "Men I Have Fished With" (Forest and Stream Publishing Co., New York), the admirable journal to which the sketches were originally contributed was represented as the victim of an untoward fate, whereas Garden and Forest is the publication that has lately suspended. *FOREST AND STREAM*, so far from being in a state of suspension, is enjoying its vigorous existence in the unclouded sunshine of prosperity, and next month will celebrate its twenty-fifth anniversary. Thus a well-intended expression of sympathy was wholly misplaced. The case of the elephant and the chickens may be recalled. Having killed the mother of a fledgling brood, the pachyderm gathered the chicks under his wing, and sitting down on them gently, as the old hen was wont to do, said: "Be easy now; I'll be a mother to you." It was a case of excellent intentions, but it hurt the feelings of the chicks. All the elephant could do was to regret the error. Verbum sat sapientia, and the people who have conducted *FOREST AND STREAM* to the maturity of its quarter centenary are wise in their day and generation. —*Philadelphia Press*.

FOR SALE.—Hunting and fishing preserve in Adirondacks. 12,000 acres forest land; several fine lakes, 15 miles trout streams. Deer in plenty. 14 miles from railroad. A. A. Leonard, Knickerbocker Athletic Club, New York.

The Kennel.

Yukon. Notes.—IV.

The Dogs.

For long journeys in the frozen Yukon country no animal of traction is so satisfactory as the dog. Horses, oxen, elk and goats are all used to a considerable extent for drawing loads over the passes at the upper end of the trail, where bases of supplies at Dyea and Skagway are handy, but the hay eaters are rarely seen at distances greater than thirty miles from the coast. Their food is so bulky that it does not pay to carry it any distance, and the country as yet affords no winter supply.

The Canadian Government had some hay at the foot of Lake Lebarge, 180 miles from the coast, that had cost \$1,100 a ton. Early in the winter circumstances made it imperative for the Mounted Police to bring through a large amount of supplies to this point, and horses and mules were used. These animals drew sleds loaded with the food, and with them went hay for their needs in tiny bales of about 75 lbs. each. This hay had been carried across Chilcoot Pass on the backs of men at a cost of 50 cents a pound. The original price paid for it in Dyea was 2½ cents per pound, and the other 2½ cents was for incidental expenses. It may easily be seen how a horse could eat his head off with that hay, and it is not surprising that private individuals do not use horses more. People who know say that the United States Government just saved itself from making a bad break when it gave up its pack train relief expedition into Dawson City. Our Government has an excellent credit, and backed as it is it might have been able to get the expedition through, but the original plan must certainly have been defeated. The expedition was not a charity, and no more was it a speculative venture, and it was proposed on reaching its destination to sell the supplies merely at cost price. This was to include the cost of getting the supplies in, and also the estimated expenses of the expedition back to the coast. There are a good many millionaires down there, but the chances are if the enterprise had been carried out on a cost basis there would have been nobody in Dawson rich enough to buy the food. With the dogs the food question is simplified. They eat the same food that their master does, and the native breeds, sharpened in this direction by their training and wolfish ancestry, can sometimes support themselves from the country. To the winter traveler in the Yukon they are all that the camel is to the Arab of the desert, or the reindeer to the Lap. Good sledge dogs always command high prices. Up in the Mackenzie country broken dogs sell for about the same price that average horses bring in civilization, or from \$25 to \$100 apiece. Their breeding and training are being carefully looked after, and owners of teams take great pride in their dogs and grow so fond of them that it is not uncommon for them to refuse to sell at any price. The difficulty of procuring dogs was one of the reasons why the Canadian Government tried horses at a time when feed cost so much.

Gov. Walsh sent a man to buy up dogs, and after a trip pretty well over the available Northwest the man returned without any, reporting that he couldn't find a dog that was a dog for any price within the bounds of reason. The Governor sent another agent with instructions not to come back till he had procured what he was sent for, and either because he wanted to get back, or else because he wasn't such a connoisseur in dogs as the other fellow, this man soon reported with a big string of canines mostly picked up on the north shore of Lake Superior. His round-up was the laughing stock of every mounted policeman and dog driver on the Yukon, and the mongrel character of the lot was freely commented upon. It was even said that a poodle was included, and the youngest sergeant in the service told me that one of the dogs had been a pet in a barber shop in Prince Albert, where he had spent his time in laying on fat rather than learning to gee and haw with a dog team.

There were some good dogs in the lot, however, and it is safe to say that the police will get out of each mother's son of them what there is in him; and what these dogs don't learn by the end of the season about the art of pulling the sledge on a trot, and keeping at it from sunrise to dark, won't amount to much. Though each member of the Mounted Police knows something about handling dogs, and many of them are expert drivers, Major Walsh has a good many professional drivers with him. Most of these men are Indians or half breeds; all are men to whom the frozen land from Hudson Bay to the Rockies and from the Arctic Ocean south is home. "Fiddler," Andrew Flett and William McBeth are types of these men. All three have driven dogs since they were big enough to handle a dog whip. McBeth is a white man who has an uncle running one of the Hudson Bay Company's posts in the far North. He is going up to see his uncle next year, and intends taking a run over into the musk-ox country, which is quite handy, with a couple of dog teams, and bringing back what robes and heads he can carry. He invited me to join him on this trip, which he says will be very inexpensive after the jumping-off point on the railroad is reached, and as I shall not be able to accept I turn the matter over to the readers of FOREST AND STREAM. If any FOREST AND STREAM man wants to go I have no doubt he can make terms with McBeth. He must bear in mind, however, that a good year is needed for the trip, and that the hunt would take place in the depth of winter. McBeth says that the Mackenzie River country where he has been is a much better game country than the Yukon. It is vastly more level in general character and much more thickly wooded. Having once known the Mackenzie, the Yukon has no charms for him.

"Fiddler" is a full-blooded Indian. He is a jolly good fellow with a football shock of hair and a wiry, sinewy figure. Both he and McBeth claim to have run seventy miles in a day beside their dog teams, and there is no occasion for doubting their statements. Fiddler likes to make records, and nothing seems to please him so

much as to travel all night or get up at unearthly hours when the moon happens to rise and plug away as long as he can see the shape of his leader in the dog team. He told me that he can't eat or sleep when he is traveling as he does at other times. He has a nervous impatience to get to the end of his journey. It took my partner and myself, pulling our own sleds; two long and wearisome days to make the distance from the Big Salmon to the Hootalinqua, but Fiddler, who left at 10 in the morning and passed us on the way, reached the Hootalinqua at 4 in the afternoon—not bad for a trail that by the map measures thirty-three miles, and which as a matter of fact is considerably longer on account of its windings and detours.

Andrew Flett is the half-breed son of a Scotchman by the same name, who crossed the Rockies from the Mackenzie with Robert Campbell in the summer of 1848, and established a Hudson Bay post at Fort Selkirk, the first on the Yukon. The elder Flett is still living. Campbell died only a year ago. For three years these men supported themselves with their guns and nets, and saw no white man's food. Flett was fresh from a mercantile life in the old country, and the experience must have been an eye-opener to him.

Andrew Flett, Jr., was born on the Peel River, near the delta of the Mackenzie, where they have a hundred days of twenty-four hours' sunshine. As a result of breeding and education he has become hardened to the cold in a wonderful way. Flett was driving dogs for John Piché, Government messenger, and the fact that Piché wore an Eskimo corset and asserted that it was in the interest of economy in the food supply that he did it, as having his boilers (figuratively speaking) protected, he did not require so much fuel to keep his engine in effective working order, was a perennial source of amusement to the half-breed.

"He eats more than I do," said Flett, "and I wear no Eskimo corset. The warmer I feel the more I like to eat." I asked him what he wore, and he pulled up his threadbare cardigan jacket and let me feel his undershirt, which would have been rated as a medium fall weight in New York. Besides his Mackinaw coat this was all the clothing he wore on his upper body. In addition he had on Mackinaw pants and light drawers, a single pair of heavy socks, and a single pair of moccasins, though he acknowledged that at times he used a blanket wrapping as well for his feet. He said that he wore the same clothing the year round—that summer and winter were much the same to him. Most of his time was spent out of doors, in the immediate neighborhood of the Arctic Circle, and he very rarely slept under a shelter. He always had a good fur robe with him, however, for sleeping, and it was his custom to build a roaring big fire largely of green wood that would keep in all night. Dead wood was used, of course, to start the fire, and after that growing spruce trees felled on the fire, or long sections of green logs thrown on—all laid parallel, so that the fire would burn out toward the ends, and so keep in the longer.

Flett had a team of five dogs that in December drew a load of 3,000 lbs. eight miles over the glare ice of Lake Bennett. The sled had to be started for them, but after that they kept it moving. These were little 40 lb. dogs, the smallest that I saw anywhere. The stock wasn't anything in particular. They looked as much like large wire-haired Scotch terriers as anything. They had been bred for the work, however, and Flett had them beautifully broken in. He talked rather contemptuously of the men he had met coming out from Dawson, saying that they had spoiled their teams so that the dogs would not go unless one man ran ahead to encourage them, and another ran alongside with a club to pound them when they faltered.

Flett never let his dogs see him on the trail. He ran behind where he could steady the sled in bad places, and handled the dogs by word of mouth. He did not believe in punishing the dogs if it could possibly be avoided. He had seen too many fine dogs ruined that way, he said. High-strung dogs, which make the best workers, most often provoke whippings, and such dogs lose heart and become spiritless as a result of punishment.

His system was one of rewards, and to prove that it was effective he could point to his dogs, which excited universal admiration by their spirit and faultless work.

They trotted along as if they enjoyed their work, in strong contrast to a great many teams where the dogs plodded along with heads and tails drooped, sore-footed, beaten and tired.

The professional drivers are never cruel, but many of the white men coming out from Dawson were. I have seen a man knock one of his dogs down in the traces and jump on him in the most vicious kind of a way. Two days later this dog was out of harness, and from his looks, no doubt, he died soon after. When following the track of a dog team you could see where the owners had left the trail from time to time to cut whips from the bushes growing along the banks of the river. Judging from the frequency of these side trails, the number of sticks that were worn out on the poor dogs was something alarming. With these dog team owners it was often a desperate race against starvation to get out to the coast, and all the kindlier feelings were shelved for the time being, and the dogs were worn to the last ounce of their strength.

As high as \$500 was paid for single dogs in Dawson. I know of \$1,500 being offered and refused for a team of five dogs. The Indians grew rich from the sale of their dogs, but their money avails them nothing, for no food is purchasable, and they are starving at many places along the river.

The native dogs, siwash, malamute, or husky, were most in demand, but all kinds of dogs were used. I saw a trick poodle in one team. His leader (there were only two dogs in this team) was a big, sullen Newfoundland, a picture of pessimism personified. The poodle had been recently clipped and still had its heavy mane and tasseled tail. It must have been a joker who set the fashion of transforming this most inoffensive of dogs into the resemblance of the king of beasts.

The poodle was the best tempered little brute imaginable. Every time the team stopped, and stops were frequent, for there was a sick man along, the dog would caper around in his harness and do everything short of

turning somersaults. He stood on his hindlegs, and turned backward in the harness, and never was still for an instant. It was comical to see how bored the big dog looked.

In a good team a 40 lb. dog will draw as much as a 200 lb. man can, and keep it up; and the dog will travel in a day twice as far as the man. The general rule for men who pull sleds is to draw a load equal to their own weight. A 200 lb. man will draw 200 lbs. on his sled, and over good going travel about fifteen miles. The dog draws the same load and goes thirty miles. He is right down to his work, and exerts his force in the long run to better advantage than the man does. Most of the dogs weigh more than 40 lbs., however, and are not given proportionately heavier loads.

The big dogs from civilization give out in their backs and hindlegs, as they have never been trained for pulling. Their feet also are too tender for ice work. On the ice any dog soon wears down his toe nails, and not uncommonly they have to be temporarily laid up for this cause.

"Husky" is a shortening of Eskimo, and indicates the origin of the dog. Huskies come from east of the Rockies, and have a great deal of wolf blood in them. Flett told me that in summer wolves came around their chip pile nights, and if circumstances favor wolf blood gets an admixture into the dog pack.

The Siwash dogs are very similar in appearance and size to the huskies. They will weight 60 to 80 lbs., and have a wolfish though kindly expression. These dogs are native to the Yukon.

The malamutes are said to be Eskimo dogs, and occasionally a white one is seen. They come from the northwestern coast of Alaska, I believe.

The Indians on the Yukon hitch up on the average two dogs in a team to pull their little, narrow track-to-boggans. In the Mackenzie country and among the professional drivers four or five dogs are considered the right number for a team. Many prefer only four. In Chilcoot and White passes newcomers from the outside world frequently worked as many as nine dogs in a team. A discussion of etiquette, in which every dog of the nine takes a mouthful, is the nearest approach to a circus they have in that God-forsaken country.

The harness for teams consists of two long traces, reaching from the leader back to the sled, and attached to the collars of each dog. In the intervals between, the traces are supported by a band crossing the dog's withers, to keep them out of the way of his feet when slackened.

The collars are circular in outline and oval in section, well padded, and of a size that will just slip over the dog's head. In harnessing a team the leader is put in first. This dog is generally the most intelligent of the lot, for on him devolves chiefly the duty of obeying signals and setting the pace. The other dogs are called in turn and their heads slipped through the collars. It takes only a second to put the team in, if the dogs are fresh and willing, but with tired teams the driver often gets black in the face, swearing at the dogs, before he can get all in place. He stands at the harness and calls the dog wanted to him. The poor brute may be curled up near by, with his nose tucked down in his fur to keep warm. At first the dog pays no attention. Then, as the exhortation becomes more lurid, he twitches his ears, raises his muzzle a little and peers at the man out of the corner of his eye—a bloodshot eye, like as not.

The man holds "Siwash's" collar and kicks the other dogs from time to time to keep them on their feet, and fairly scorches the dog with a hot simoon of profanity, and at last poor, tired old "Siwash" hobbles over and submits his neck to the yoke.

"You'll get limbered up soon enough, old bastard," the man says, as he kicks the dog's hindquarters around in line with the traces, and "Siwash" knows from sad experience that he speaks the truth.

Two general types of sleds were used for dog teams, and individual variations were many. The first was the basket sleigh, which cost in Dawson eight ounces (\$16 to the ounce), and the other was the ordinary Yukon sled, 7 ft. in length, similar to those pulled by men. This latter sold for \$40 in Dawson. In Seattle such sleds can be bought for \$5.

The load is fastened on this sled by crisscrossing a tie rope from side to side, and it is generally managed by a man who runs between the dogs and the sled inside the traces, and handles the "gee pole." The gee pole is a green sapling 6 ft. long and 2 or 3 in. in diameter, firmly lashed to the front end of the sled, and projecting upward like the bowsprit of a boat, till its highest end is convenient for a man's hand. It is used to steer the sled, and by its adroit handling the sled is often kept from upsetting. The basket sleds are frequently steered from behind. The back end is built up to the height of a man's chest, with a horizontal bar on top to hold on to. Basket sleds are so named from the light wooden and wire framework that is built up on top to hold the load. This framework runs completely around the sled, generally flaring outward. It is a foot or so in height. Basket sleds are not infrequently 9 or 10 ft. in length. The standard width is 16 in., though a few sleds tracked 20. Toboggans are not common among the white men, though the Mounted Police packers had some. They are not so good for an ice trail as the sleds, as they slide sideways on the irregular surface of the river, whereas the sharp edges of the sled runners hold much better. A sled too runs easier on ice, even when the ice is covered by snow. Some of the police sleds had a toboggan body, so that if the runners sank more than a certain number of inches in the snow it became converted into a toboggan. It was an ingenious adaptation, but not popular among profane dog drivers, who said it was no good either as sled or toboggan. Dogs are driven by a combination of English, French and cuss words. "Machan," or "mash," or "mush," as the Dawson cockneys had it, which is no doubt derived from "march chien," clipped short and Anglicized from the voyageur patois means "go ahead."

The dogs are started with this word, and also encouraged to increase their speed by it. They are turned to the right or left by "gee" and "haw," and brought to a stop by "whoa" or "whoa-back."

A good team, not too heavily loaded, keeps on the trot all the time; twenty-five or thirty miles is covered in

six or eight hours, which is about the ordinary day's journey. Toward nightfall, or when approaching a camp, the dogs always increase their speed, for they like to make a grand-stand finish.

To keep up with the dogs requires a constant jog trot, and thirty miles of this makes a man feel averse to being disturbed after he once sits down at his journey's end. I have seen men so stiffened after such a run that it was the next thing to a physical impossibility for them to move once they had settled down to rest.

The dogs are fed bacon, bread, mush, rice, and in fact almost anything their owners have in their outfit. The bread is baked in long, flat loaves called bannocks. Dried salmon is generally placed ahead of other foods, but last year it was very hard to procure in the interior. The bacon and bread diet is much better than fresh meat, and though horse meat and beef heads and offal could be procured at points on the trail, they were not generally fed. One pound of bacon is said to do a dog more good in that cold climate than 3lbs. of fresh meat. They want fat, and the fresh meat is lean.

In the interior dog teams are used for freighting from Circle City and Dawson to the mines tributary to these respective centers. They have been also used to a considerable extent for freighting from Circle to Dawson. On the short trips one freighter told me he earned on the average nearly \$50 a day with his five dogs. The charge for taking "passengers" out from Dawson to the coast, 650 miles, was from \$500 to \$600 a head, or about \$1 per mile. Passengers sometimes had to foot it every step of the way, and work at making camp as hard as any one. They paid the \$1 a mile for having their provisions carried. J. B. BURNHAM.

In the Kennel World.

VOLUME XIV. of the American Kennel Club Stud Book series has made its appearance, and the steady increase since the years 1894 and 1895 has been made more apparent. The volume for 1894 had 3,666 registrations, and low-water mark was reached in 1895 with 3,473, which was followed by 3,527 in 1896, and now we have 3,737 for 1897. There is also a marked increase during the same period in the dog show record. In 1894 the record given for individual dogs filled fifty-eight pages, and at that time any mention made by a judge was recorded, whereas nothing lower than a prize winner is now taken notice of, and yet this year there are 103 pages of dog show record. There are also the official awards of the various field trials of the beagle clubs and Brunswick Fur Club, and it is a pity that the field trials by setters and pointers are not also to be found in the stud book, and thus be of easy reference. It is not because of lack of desire that the American Kennel Club does not publish these, but from apathy on the part of the field trials clubs. The American Kennel Club is too firmly established to have to ask for support not willingly tendered, and as it has a surplus of several thousand dollars there is not the slightest doubt that it would willingly oblige the field trials clubs by publishing their records. That would entail some sort of membership which could be got over readily enough if the field trials clubs would form an association of their own, and let it affiliate itself in some way with the American Kennel Club. We have the Pointer, Gordon Setter, Irish Setter, Spaniel and several beagle clubs as members, so that it cannot be said that owners of sporting dogs are not interested in the American Kennel Club, which had a membership of sixty-six clubs for the year 1897.

Still another evidence of the support it receives from pointer, setter and spaniel men is the large registration of these breeds. The following figures are based upon the rates of eight pedigrees to the page, which is the average in the stud book, and avoids the necessity of counting heads: English setters 632, Gordon setters 64, Irish setters 112, pointers 432, spaniels 320, beagles 120, or a total of 1,680 out of 3,737. Any belief that the American Kennel Club and field men are not working along for each other's good is denied very emphatically by these figures. The two breeds of St. Bernards combined alone outnumber the English setters, but taking all setters versus all St. Bernards they are practically equal in number. No argument could possibly be advanced so conclusive as these figures for the stud book becoming the medium of official record of field trials, and the clubs ought to consider the advisability of taking steps toward its becoming so, and make each volume a full reference history of the preceding year.

Still another way of judging of the hold the Kennel Club has upon dog owners of all kinds is to be found in the list of the associate members, the list now numbering 218, as against 194 for the month of December. This membership is purely voluntary, and for the \$5 dues each member gets the Stud Book, Gazette and two free registrations.

What the Kennel Club will do with its surplus is something that will ere long have to be considered seriously. It was, we believe, the intention some years ago to invest \$5,000, as soon as the surplus reached that amount, and use the interest as a special prize fund, but the litigation that took place at that time cost the club about \$2,500 and the fund prospects faded. Now, however, with a balance of \$4,276.49 on Dec. 31 of last year, and an annual increase of \$1,000, as has been the case for the past three years, the fund figures will soon be reached. The club is now giving medals of record for champions as fast as they are turned out at dog shows, but the rate at which medals are won will not eat up the interest on \$5,000, much less the annual addition to the surplus.

The storm center which developed in California last month has disappeared, and no one is particularly harmed over the result except the tempest decocter. Inflamed by false statements regarding indifference to letters and requests sent to New York, the Pacific Coast Mastiff Club sent out a circular letter to the clubs proposing a meeting for secession. A copy of this was sent by a California member to the office of the American Kennel Club, and there was nothing to be done but place the club and officers under suspension. At the same time, however, the Mastiff Club secretary had written a letter of complaint regarding the alleged

pigeonholing of the club letters and received the information that the letters had been duly presented to the rules committee and fully considered by its members. The result of this letter was that at the meeting of the club held on April 6 the resolution regarding secession was unanimously rescinded. The prompt action of the St. Bernard Club, the strongest specialty club on the coast, in repudiating secession and giving notice that it would under no consideration support any show, either by prizes or entries, not held under A. K. C. rules, was the pivotal point in suppressing disaffection, for it made the course of the San Francisco Kennel Club plain sailing. Strange to say, the suggestions of the Mastiff Club were practically carried out by the new rules, while the St. Bernard Club wanted something else, yet accepted the situation most loyally.

The cruelty of joking regarding hydrophobia was fatally illustrated last week when a young man died at a hospital in this city as the direct result of the influence of imagination. He had been bitten a short time before by a dog, but the wound had healed and the matter would have ended there, but his shopmates and companions thought it good fun to joke with him as to hydrophobia, with the result that his mind became so worked upon that he went to the hospital. There he was assured that there was nothing the matter with him, but he persisted in remaining for treatment, and although everything was done to clear away the hallucination he lost his reason and died a raving maniac. GAD.

Yachting.

MR. AND MRS. C. OLIVER ISELIN, who have been abroad for several months, returned to New York last week. Just before leaving London Mr. Iselin, through Ambassador Hay, offered his services to the United States Government in any capacity in which he might be useful.

MR. CLINTON H. CRANE has placed with the Spalding St. Lawrence Boat Co., of Ogdensburg, an order for two racing 20-footers, from his designs for the Seawanhaka trial races. Mr. Crane is now in New York, after spending the winter at the Glasgow University, in the Department of Naval Architecture.

Spray.

21ft. Fast Cruiser.

(Concluded from page 314, April 16.)

THE general arrangement and construction of Spray were illustrated in our previous issue. The cabin house is 8ft. 6in. long inside, with a breadth of 4ft. 6in. and headroom of 5ft. 2in. at the fore end. The floor is 21in. wide, a compromise between headroom and footroom. The cockpit is 6ft. long (8ft. inside of coaming) and of average width of 4ft., the floor being 16in. below deck and 8in. above L.W.L. It is fitted with scuppers for drainage. Below is room enough for a water tank, if the yacht is to be used on salt water, and also for a good ice-box. The lockers in the cabin give room for two berths with the usual buffet at the fore end, or the latter may be omitted on one side and the locker carried forward to make a second berth. The interior of Spray is merely fitted with lockers and shelving, the final arrangement of closets, shelves, etc., being left until the yacht has been used for a time, and the best possible disposition of space determined by actual trial. There is room for one hand forward, if necessary, in a hammock berth; but in so small a craft the interior will naturally be fitted up entirely for a Corinthian crew.

The construction has been planned to give a thoroughly strong and durable craft, with tight bottom and dry decks for an indefinite number of years. While lightness has been considered and the scantling is cut to near the safe limit, there is plenty of wood to hold the fastenings and to stand the strain of caulking, hard sailing, etc. The specifications are given in full for the benefit of any one who may wish to build from the design, as follows:

Frame.

Keel—White oak, sided 5in., moulded as per drawing, 9in. amidships.

Stem—White oak, sided 3in., moulded as per drawings.

Sternpost—White oak, sided 3in. at tuck, tapering to 1½in. at heel, with score for rudder on after side.

Horn Timbers—White oak, sided 1in., moulded 6in. on sternpost and 3in. at after end, which shall be jogged into sternpiece and well bolted.

Chock—White or yellow pine, 3 by 2½in., fitted between the two horn timbers and projecting ¾in. to form rabbet.

Rudder Trunk—To be carefully built, with sides of 1½in. white pine, to form, with sternpost and horn timbers, a water-tight box. The joints to be made with cloth painted, and caulked where required. The lower end to be closed with an oak chock, fastened with brass screws. The bottom of trunk to be wide enough to permit rudder to ship easily.

Sternpiece—Oak, shaped as per drawings, including round of deck, with rabbets for planking and deck. To be well bolted to horn timbers. All superfluous wood to be cut away, to save weight.

Quarter Timbers—If used, to be of oak or hackmatack, shaped as per drawings and well fastened to planksheer, sternpiece and sheerstrake.

Mast Step—Oak, bolted to stem, with long mortise and space for wedges fore and aft of mast.

Deadwoods—As per drawings, of oak or yellow pine. Stopwaters—Of dry white pine, ½in. in diameter, carefully placed in all joints of stem, keel, deadwoods, etc.

Frames—Six frames spaced 42in. on centers, to be of oak, single-sawn, from knees of the proper sweep; to be sided 1½in., moulded at heels 2½in., at turn of bilge 1½in., and at heads 1in. (two frames abreast mast to be sided 1½in.) Between each pair of sawn frames three bent frames, of oak, to be placed, spaced 10½in. on centers, sided and moulded 1in. from heel to head. The

heels of all frames to be jogged into keel and deadwoods and securely bolted. Suitable timbers to be cut in all frames and floors.

Floor Knees—Each sawn frame from mast to after end of iron keel to have a forged floor knee of flat iron, 1¼ by ¾in., with arms 1ft. 3in. long; these knees to be carefully forged in the throat. Each alternate bent frame to have a solid floor of 1in. oak plank, well bolted to keel and to heels of frames.

Shelf—Clear oak, or yellow pine in single length, 2 by 1½in. for middle half of length, tapering to 2 by 1in. at ends.

Bilge Stringer—Clear oak or yellow pine in single length, 2 by 1¼in. for middle half of length, tapering to 2 by ¾in. at ends.

Deck Frame.

Deck Beams—Oak or hackmatack. Main beams, at bitts, partners, fore and after ends of house, and transom, to be sided 2in. All other beams and half beams to be sided 1in. All to be moulded 1¾in. To be spaced not over 10in. on centers.

Knees—Oak or hackmatack, sided 1¾in.; one abreast of mast on each side, one at middle of trunk, and one at after end. One lodging knee abreast mast and one at after end of house.

Partners—Oak or yellow pine, 1½in. thick at mast, also filling at bow in place of breasthook; and at bitts.

Partner Planks—Oak, ¾in. thick and 10in. wide, in center of deck forward; 6in. wide aft.

Planksheer—Oak, in single length, ¾in. thick and 3½in. wide amidships, tapering to 2½in. at ends. To be well fastened to sheerstrake and beams.

Planking and Decking.

Planking—White cedar on bottom; wales of yellow pine in single lengths. Other planking to have not over one butt in each strake, such butts to be made on butt-blocks of ¾in. oak; butts to be at least four frames apart on adjoining strakes, and if in the same frame space to be separated by not less than three strakes. The planking to finish full ¾in. The planks from the bilge upward to be not over 3½in. wide. All seams to be close on inside and full 1-16in. opening on outside for caulking. The entire outside of hull to be carefully planed off.

Deck—Of clear and dry white pine, ¾in. thick and not over 2in. wide. To be laid with sweep of side line; all ends properly supported and fastened. Seams of deck to be caulked with cotton and payed with marine glue.

Deck Joiner Work.

Rail—Oak, 1in. by 1¼in., around edge of planksheer, with scuppers.

Cabin Trunk and Coaming—Oak, ¾in. thick, side of trunk about 9in. high, coaming about 5in. high, both thoroughly edge-bolted with ¼in. steel rod. Two oval windows of ¾in. plate glass in each side of trunk, four in all, and brass-hinged decklight, of as large a size as space permits, in middle of fore end. Ledge of oak, 2½ by 1½in., around inside of trunk to carry beams; beams of oak, 1½ by ¾in., spaced 10in., covered with ½in. matched pine, with canvas over top. Companion slide and doors of mahogany.

Cockpit—Sides of matched mahogany, floor laid the same as the deck, both to be perfectly water-tight.

Fore Hatch—Coamings and hinged hatch, opening 18 by 15in., all of mahogany.

Bitts—Locust, 3½ by 2¼in., running down to sternpiece and well bolted. Keyed below deck. Locust keel, 1½ by 1in.

Cleats—Locust, for sheets, as per sail plan.

Rudder—Stock of oak or locust, 3in. diameter, tapering to 1½in. at heel. Backing of yellow pine securely through-bolted to stock.

Fastenings.

Keel Bolts—Steel, ¾in. diameter, about 12 bolts in all, with standard heads, nuts and washers.

Blunt Bolts—All deadwood, keel and frame bolts to be of good quality of iron or steel, properly galvanized and neatly headed over washers of the same metal. Stem, keel, horn timbers and deadwoods to have ¾in. bolts; heels of frames to be fastened with ¾in. bolt iron or spikes; plank floors to be fastened to stem, keel and horn timbers with two ¾in. bolts through each; iron knees to be fastened to keel with two ¾in. bolts. Planking to be fastened with galvanized iron boat nails in all frames and at hood ends. All parts not specified to be fastened in the usual manner. All plank fastenings to be set in for putty stops, and all fastenings about deck and trunk to have wooden deck plugs set in varnish.

Interior Joiner Work.

Floor—Ash, ¾in. by 2½in., matched, in battened sections fastened down by large brass screws.

Ceiling—Cabin to be ceiled with ½in. white pine or similar wood.

Ladder—Mahogany, with three steps, each with rubber tread.

Lockers—White pine, ¾in., one on each side for seat and berth. Lockers and shelves in forecabin for dishes, etc.

Metal Work.

Keel—Of cast iron in one piece, soundly and accurately cast to shape and smoothly finished; weight about 3,900lbs. To be bolted to hull with 12 steel bolts of ¾in. diameter.

Rudder Braces—Two, of galvanized iron, neatly fitted and well fastened to post and rudder. Brass cap with name of yacht on head of rudder stock. Brass plate around rudder stock on deck.

Chain Plates—Two for main shrouds and two for runners, of 1½ by ¾in. iron, with ¾in. hole for pin of turnbuckle. Two for bowsprit shrouds, 1½ by 3-16in., with ¼in. hole.

Gammon Iron—2½ by ¾in. iron. Bobstay plates, bobstay of ¾in. iron rod, with turnbuckle. Cranse iron for bowsprit end. Traveler for main sheet blocks; one pair of ¾in. turnbuckles for main shrouds and one pair of ¼in. for bowsprit shrouds. Gooseneck and spider band, 5in., for mast and boom.

Brass Work—Fittings for rudder, rudder cap, two

SPRAY, 21FT. L.W.L. FAST CRUISER.
Designed for, J. W. Keogh, Esq., by W. P. Stephens, 1898.

SPRAY. DETAILS OF IRON KEEL.

SEAWANHAKA ONE-DESIGN CLASS. W. B. STEARNS, DESIGNER. DIFFER, ARTHUR ISELIN, ESQ.
Photographed by N. L. Stebbins.

leading chocks on bow and two on quarters; eyebolts and leaders for jib sheets, screw deck plate for pump; chain pipe; hasp, hinges and lock for cabin door; brass-hinged deck light.

One No. 4 Babbitt anchor, galvanized.

Plumbing.

Pump—Single-barrel copper yacht pump, $2\frac{1}{2}$ in. diameter, with $1\frac{1}{4}$ in. suction pipe to well, galvanized iron pump spear and brass screw plate in deck.

Scuppers—Of tin. lead pipe, fitted in cockpit floor, one on each side, to drain below waterline.

Spars.

Spars of spruce, to be properly proportioned and neatly worked; mast, 5 in. diameter at deck, about 31 ft. heel to truck; bowsprit, $3\frac{1}{2}$ in. in gammon, 7 ft. long; boom, 4 in. diameter in slings, 25 ft. long; gaff, $2\frac{3}{4}$ in. diameter by 14 ft.

Fittings.

Tiller—Locust or iron.

Boom Crotch—Oak, as per drawings.

Caulking and Paying.

All seams of planking to be properly caulked with cotton, run with paint and payed with putty. All seams of deck and cockpit to be carefully caulked with cotton, using no oil or grease on the iron, and run with Jeffries marine glue, as per directions furnished by maker. All nail and screw holes about decks to be filled with wooden deck plugs set in varnish; all other fastenings to have putty stops.

Painting.

Inside of hull, below floor, to be painted with one coat of red lead and linseed oil.

Bottom—To have two priming coats and one finishing coat, smoothly applied; the latter of suitable anti-fouling paint.

Topsides—Up to rail, to have two priming coats, both well rubbed down; and one finishing coat of best black or white, no oil to be used.

Varnishing—The spars, rails, planksheer, deck, cabin trunk, and all deck work to have one coat of filler and two coats of Crockett's spar composition, each coat being thoroughly dry before the next is put on. The interior of cabin to have one coat of filler and two of Crockett's spar composition.

Rigging.

Standing Rigging—One main shroud to each side, masthead pendants and runners, jib stay, of best quality steel wire rope; to be neatly spliced and served.

Running Rigging—Of manilla rope.

Blocks—For ordinary knockabout rig, yacht blocks with patent sheaves.

Sails.

Mainsail and jib of 8 oz. cotton, double-bighted, with reef points, etc., and covers.

The details of the iron keel are given to a larger scale; the pattern is best made of a common quality of pine, two or three thick planks screwed together and worked out to the shape by means of templets made from the full-size drawing on the floor. In order to get the full weight of keel, about 3,900 lbs., the full allowance for shrinkage must be made, about $\frac{1}{8}$ in. per foot, the pattern being larger than the drawing in this proportion. The foundryman who is to cast the keel should be consulted before the pattern is made as to the proper allowance for shrinkage in the length, breadth and depth, also the placing of cores for the bolt holes. The keel should be cast and ready in the shop before the wood keel and deadwoods are completed, so that in the event of the iron keel being somewhat different from the drawings, owing to this shrinkage, the wood keel may still be made to fit it.

The main keel does not rest on the iron keel, but a piece of deadwood is interposed, as shown in the longitudinal section, page 314, bringing the keel up to a proper point to take the rabbet.

There being no restriction on bowsprit or sail plan to consider, a broader and lower rig than the regular knockabout sail plan was selected; the bowsprit gives a finish to the yacht, and is rather more shipshape in appearance, besides offering a convenient means of carrying the anchor, and as the yacht is intended for open water, and to carry a fairly large rig, there seemed no special advantage in the high and narrow rig of the knockabout as opposed to the more moderate proportions of base and height, with a decided lowering of the weight aloft. If desired, the sail plan can easily be adapted to the knockabout rig, with jib tack at the stemhead and longer mast and hoist. We shall be glad to give any further information to those who may desire to build from the design.

Messrs. Rice Bros. inform us that they are prepared to duplicate the yacht, to these specifications, for \$800.

The Seawanhaka and Cohasset Classes.

THE accompanying photos, by N. L. Stebbins, of Boston, show two of the new one-design yachts designed and built during the winter by W. B. Stearns, of Marblehead, Mass. The boats Dipper and Remora, the former of the Seawanhaka design and the latter of the Cohasset, are the first of their respective classes afloat, and have recently been under trial at Marblehead. Dipper is owned by Arthur Iselin, of New Rochelle, and Remora by C. H. Cousens, of Cohasset. The design of the Seawanhaka class has already appeared in the FOREST AND STREAM. The Cohasset class is very similar, but the draft of hull has been reduced to 3 ft. 6 in., with a deeper centerboard, and the sail area has been increased to 600 sq. ft. The photos show what handsome little ships Mr. Stearns has turned out, and there is no doubt that both classes will show well in the matter of speed.

COHASSET ONE-DESIGN CLASS. W. B. STEARNS, DESIGNER. REMORA, C. H. COUSENS, ESQ.
Photographed by N. L. Stebbins.

Cohasset Y. C.

Coming rapidly to the front as a racing organization is the Cohasset Y. C., and it promises to make its mark alongside many of the racing clubs of the Yacht Racing Association. At its annual meeting on April 14 the club voted to arrange for a date in the Y. R. A. circuit upon which to give an open race, and also to provide suitable prizes therefor. Last year's open races for knockabouts over the triangular course to the lightship and the bell buoy on Harding's Ledge was a very successful one, and an open race this year for all classes would undoubtedly take the same rank.

The club has money and many enthusiastic yachtsmen, a combination which is hard to beat. Add a fine racing course, and success ought to be in sight. It will be cordially welcomed to the racing ranks.

The following were the officers elected: Com., Frederick H. Pratt; Vice-Com., Charles W. Gammons; Treas., Charles H. Cousins; Sec'y, Irving L. Blossom; Meas., Arthur O. Higgins. Executive Committee: Commodore, vice-commodore, treasurer, secretary, William H. Crane, Benjamin C. Clark, Amos A. Lawrence, Caleb Nichols, Lyman D. Willcutt. House Committee: commodore, vice-commodore, Lyman D. Willcutt, Samuel C. Bates, Caleb Lothrop. Membership Committee: Commodore, vice-commodore, Edward F. Willcutt, Wentworth J. Earle, Edward F. Ripley, B. Preston Clark, Frank R. Pegrum, Frederick Higginson, Harry E. Mapes. Regatta Committee: Commodore, vice-commodore, Daniel N. Tower, Ralph B. Williams, Alanson Bigelow, Jr., Hugh D. Montgomery, Arthur O. Higgins.

The reports of the secretary and treasurer showed a club membership of 120, and a balance in the treasury after retiring 19 of the bonds issued for building the club house.

The club voted to recognize the Knockabout Association of its members, the membership in which is held by the owners of the 21ft. one-design knockabouts built by W. B. Stearns at Marblehead, and agreed to provide races for the boats of the class under Association rules.

The Association has at present nine members and nine boats, as follows: Francis J. Moors, Albert S. Bigelow, Alanson Bigelow, Jr., Henry W. Knowles, R. B. Williams, Albert C. Burrage, Wm. R. Sears, Henry De Ford, and Charles H. Cousins, secretary. Races are to be held Saturdays and holidays, beginning on Memorial Day.

Charles H. Cousins was elected delegate to the Y. R. A. of M. The club has received from Mr. Stearns a very handsome model of the new knockabouts.

Hobe Sound Y. C.

Hobe Sound, Fla., April 11.—The H. S. Y. C. continues to flourish, notwithstanding the freeze of last January. We have sailed five races of our second series and the points are pretty even. The corrected times in the first four races are as follows, for first class:

	1	2	3	4
Gull	1 05 18	1 39 46	1 39 28	0 57 15
Wenonah	1 13 38	1 43 36	1 21 16	1 07 25
Wanda	1 09 23	withdrew.	1 28 03	1 03 05
Sprogie	1 27 27

The points won are:

		Total.
Gull	4	3
Wenonah	2	2
Wanda	3	0
Sprogie	1	...

In the second class only two boats have been racing, with the following result in points:

Lorraine	0	2	1	3
Juanita	0	1	2	3

The fifth race was sailed to-day in a strong southeaster. The yachts got away well together and for a wonder stayed together. The Gull rounded the first buoy about 15s. ahead of Wanda; Wenonah, Penguin and Sprogie, in the order named, not over 1m. behind Wanda. Gull set her gafftopsail, which immediately split, and a few seconds were lost while the crew cleared away the wreck. She held her own, however, and crossed the line on the first round still in the lead. On the second round Gull, Wanda and Penguin seasawed for the first mile, but Penguin finally drew away, rounding the mark 22s. ahead of Gull, Wanda 10s. behind, and Wenonah close up. On the run home, Penguin steadily increased her lead, Gull and Wanda still scrapping, with Wenonah slowly crawling up on them.

The jibe around the north buoy and the short beat to the line were very pretty. Gull was only 2s. ahead of Wanda, and she 4s. ahead of Wenonah. It was a matter of time allowance to decide the winner.

	1st round.	2d round.	Elapsed.	Corrected.	Points.
Penguin	43 39	46 09	1 29 48	1 29 48	5
Gull	45 45	49 10	1 34 55	1 31 40	4
Wanda	45 20	48 58	1 34 28	1 31 48	3
Wenonah	45 51	46 30	1 32 21	1 32 21	2
Sprogie	Withdrew.				

	Second Class.	Actual.	Corrected.
Juanita	1 05 14	...	1 05 14
Ariel	1 06 55	...	1 06 55

H. D. McVEAN, Purser.

Gilberts Bar Y. C.

WAVELAND, Fla., April 11.—The Gilberts Bar Y. C. held their usual monthly regatta Saturday, April 2. There was a strong northeast wind. Results as follows:

	First Class.	Actual.	Corrected.
Albatross	0 38 14	...	0 38 14
Britannia	0 40 02	...	0 38 41
Penguin	0 41 57	...	0 41 11
Joker	0 41 27	...	0 40 20

Winner, Albatross.

	Second Class.	Actual.	Corrected.
Swallow	0 46 49

PAUL M. ASTON, Sec'y.

Corinthian Y. C. of Philadelphia.

THE third general meeting of the Corinthian Y. C. was held in Philadelphia on April 13. It was announced that Com. Griscom had resigned on April 4, and that the trustees had elected Alexander Van Rensselaer, steam yacht May, to fill the vacancy. The trustees reported that extensive improvements had been completed at the club station at Essington, also the election of Merle Middleton as a resident member and Mrs. Kate Felton Elkins as a flag member.

A. C. A. Membership.

APPLICATIONS for membership may be made to the purser of the division in which the applicant resides on blanks furnished by purser, the applicant becoming a member provided no objection be made within fourteen days after his name has been officially published in the FOREST AND STREAM.

Atlantic Division.

Rifle Range and Gallery.

Revolver Records at Louisville.

LOUISVILLE, Ky.—The regular weekly shoot of the Louisville Revolver Club was held at the Armory, Wednesday evening, the 13th inst., Messrs. L. S. Barnett, president of the Hall & Hayward Co.; Dennis Long Miller, connected with one of our largest foundries, and Mr. G. F. Norton, a prominent business man joined this meeting. Mr. G. F. Norton will present the member making the highest average score in the Brooklyn-Louisville telegraph match with a silver cup. The most prominent society people of our city will be invited by Mr. Norton to witness this contest.

Mr. H. S. Gilbert in the 15yd. distance made a score of 96 out of a possible 100, shooting ten times in 33 seconds, and in the 30yd. distance made a score of 97 out of a possible 100, thereby lowering the former club records. Mr. Gilbert used Peters cartridges, loaded with King's semi-smokeless powder, full service shells.

E. B. Dye, using the above make of cartridges and powder, made a score of 99 out of 100 at the Armory on March 29, and in token of this remarkable shooting the Peters Cartridge Co. presented him with a solid gold watch chain, highly engraved, which Mr. Dye prizes very much.

The secretary of the club, Mr. Sim Watkins, has a new idea in the way of a score book for keeping scores of the shoots, and will be glad to send sheet to any one interested in such work. It will be good for rifle or shotgun scores as well.

Below we give scores in full for last contest:

Ten yards, 2in. bullseye counts 10:

W J James	8	9	10	8	10	10	9	9	10	93
H S Gilbert	9	10	9	9	9	8	10	10	9	81
E B Dye	10	10	8	6	9	9	10	4	7	83
S Watkins	8	7	6	8	8	7	6	2	8	63

Fifteen yards, 4in. bullseye counts 10, 20 seconds allowed for each 5 shots:

	Total.	Seconds.
H S Gilbert	10 10 10	9 9 10 10 10 10 96
W J James	10 10 10	9 5 10 10 10 9 92
E B Dye	10 10 9	8 3 9 9 7 6 5 76
S Watkins	8 7 6	5 1 8 7 7 6 5 60

Twenty yards, standard American target, 1in. bullseye counts 10:

H S Gilbert	8	7	10	8	10	9	6	7	10	85
W J James	7	0	0	8	5	8	8	2	3	49
Sim Watkins	0	3	3	7	0	7	1	5	10	39

Thirty yards, 4in. bullseye counts 10.

H S Gilbert	10	10	10	10	10	9	9	10	10	97
W J James	8	8	7	4	8	8	10	5	10	78
E B Dye	7	10	8	6	4	6	7	8	6	97
Sim Watkins	6	5	4	9	5	7	2	1	1	49

Shell Mound Rifle Range.

SAN FRANCISCO, Cal., April 11.—The customary open shoots of the rifle clubs, the "spring festivals," began April 3, the Turners' Schuetzen opening the ball. A good attendance was present.

On the same day the California Schuetzen Club held its regular medal shoot, and a notable score was made by the famous shot A. Strecker. The scores of this club are 20 shots, 25-ring target, 200yds., only one entry. Strecker made 461 rings, thus breaking the Coast record.

The FOREST AND STREAM deserves credit for the exhaustive report of the Boston tournament, given in the issue of April 2. Several of our local cracks are loudly lamenting their inability to be present, especially the experts with pistol and revolver.

Yesterday was medal day at Shell Mound, and good scoring was done:

Germania Schuetzen Club.—First championship medal, J. Utschig, 443; second, H. Hueber, 413; first class, J. Peters, 380; second class, J. D. Heise, 396; third class, Wm. Goetz, 341; first and last best shots, J. D. Heise, 24 and 25.

San Francisco Schuetzen Verein.—First championship medal, A. H. Pape, 441; first class, John Peters, 414; second class, F. Koch, 400; third class, R. Stettin, 394; fourth class, John Langenar, 361; best first shot, Wm. Lindeman, 24; best last shot, J. D. Heiser, 25.

Columbia Pistol and Rifle Club.—Pistol, 50yds., champion class: C. M. Daiss 39, A. B. Dorrell 47, J. E. Gorman 47, M. J. White 62, H. C. Young 68. First class: S. M. Bailey 61, F. E. Mason 65. Third class: J. P. Cosgrove 76, B. P. Jonas 78, Mrs. S. Mannell 94. All comers, Siebe medal: Dais, 40, 41, 41, 46, 47; Gorman, 32, 44; F. O. Young, 40, 40, 45, 46, 47, 48.

Medal and Ross trophy for ladies, 50yds.: A. B. Dorrell, 18, 20, 21, 22, 24, 28; F. E. Mason, 22, 24; Mrs. W. J. White, 52.

Rifle, 200yds., all comers' medal: A. H. Pape, 44, 52, 54; F. E. Mason, 49; F. O. Young, 51, 51, 53.

Members' rifle medal: A. B. Dorrell 49, J. E. Gorman 60, 66. Champion class: D. McLaughlin 54, F. O. Young 61, F. E. Mason 68. First class: A. B. Dorrell 71, C. M. Daiss 72, J. E. Gorman 73, C. A. Bruner 96. Second class: M. J. White 120, S. Barley 128. Third class: B. Jones 114, S. Mannell 114, Mrs. White 115, M. Carillo 177.

On next Sunday the California Schuetzen Club will hold its spring shoot at Schuetzen Park. Over \$1,000 will be distributed on this occasion in prizes. Philo Jacoby, the veteran marksman, has charge of the affair, and he is doing everything in his power to make it a success.

ROEEL.

Iroquois Rifle Club.

PITTSBURG, Pa., April 14.—A challenge issued some time ago by the Iroquois Rifle Club, of Pittsburg, to the Pittsburg Rifle Club, of the same city, for a gallery team shoot found its culmination in a team match, which took place at the indoor range of the Iroquois Club, on the evening of the 13th inst. Five members from each club constituted the respective teams, each shooter firing 30 shots in six targets of 5 shots each, the reduced standard American target being used. The contest was a most exciting one, and as the scores will show was nobody's match until the last shot was fired. The team of the Iroquois Club was victorious, defeating the Pittsburg Club team by 7 points. The scores made were as follows:

	Iroquois Rifle Club.	Pittsburg Rifle Club.
A C L Hofmeister	46 45 45 42 46 48—272	
H Spurling	36 30 31 42 39 35—213	
A O Goldstrom	36 46 44 40 42 39—247	
H B Pierce	42 40 43 44 48 45—262	
R F Phillips	45 47 44 48 41 47—272—1266	

C P Sorg	37 45 40 43 43 41—249	
L P Ittel	49 43 42 49 43 48—274	
R Hoffman	38 41 36 37 31 42—225	
D Black	40 45 44 46 40 39—254	
F Ingersoll	41 41 44 42 45 44—257—1259	

A. C. L. HOFMEISTER, Sec'y.

Pittsburg Rifle Club.

Several members of the Pittsburg Rifle Club engaged in a practice shoot at the indoor range on the evening of April 5. They shot at 20yds., off-hand, on standard targets, 5 shots per target, the center counting 10. Ittel was at his best. The following scores were made:

Ittel	49 49 50 48—196	Engersoll	46 46 46 45—183
Bradshaw	48 47 46—188	Hoffman	46 45 44 43—178
Black	48 47 46 46—187	Schmidt	45 40 40 33—158
Ewing	48 47 47 45—187	Shaw	41 39 36 36—152

Trap-Shooting.

Fixtures.

April 18-20.—St. Louis, Mo.—Tournament for amateurs only at the Du Pont shooting Park, under the management of J. A. Cotty.

April 19.—Brookton, Mass.—All-day shoot for merchandise prizes, first of weekly series. B. Leroy Woodard, Manager.

April 19-21.—Lincoln, Neb.—First annual amateur tournament of the Lincoln Gun Club. Each day \$50 added to the purses. Geo. L. Carter, Sec'y.

April 27-28.—Peru, Ind.—Second annual amateur tournament. Jack Parker, Manager. Address all communications to J. L. Head, Peru, Ind.

May 4-5.—Brunswick, Ga.—Tournament of the Interstate Association, under the auspices of the Atlantic Gun Club. J. H. Polhill, Sec'y.

May 4-6.—Newburgh, N. Y.—Trophy shoot, Hudson River Trap-Shooters' League, on grounds of Newburgh Gun and Rifle Club. J. B. Rogers, Manager.

May 4-6.—Eau Claire, Wis.—Tournament of the Eau Claire Gun Club. E. M. Fish, Sec'y.

May 10-11.—St. Cloud, Minn.—St. Cloud Gun Club's amateur tournament. E. S. Hill, Sec'y.

May 10-13.—Des Moines, Ia.—Charley Budd's shoot. First three days, targets; \$350 added. Fourth day, live birds; 25 birds, \$25, handicap, \$50 added.

May 16-21.—Kansas City, Mo.—Annual tournament Missouri State Fish and Game Protective Association. G. M. Walden, Pres., Kansas City.

May 17-19.—Macon, Miss.—Tenth annual shooting tournament of the Noxubee Gun Club. C. M. Scales, Manager.

May 18-19.—Crawfordsville, Ind.—Tournament of the Crawfordsville Gun Club. C. E. Lacy, Sec'y.

April 27-29.—Waterloo, Ia.—Annual tournament of the Waterloo Gun Club.

May 24-27.—Omaha, Neb.—Twenty-second annual tournament of

the Nebraska State Sportsmen's Association. F. S. Parmelee, Sec'y.

May 25-26.—Wilmington, N. C.—Tournament of the Interstate Association, under the auspices of the Eastern Dog and Game Protective Association. H. McL. Green, Pres.

May 25-27.—Owego, N. Y.—Owego Gun Club's tournament. Two days at targets, third day at live birds. Frank B. Tracy, Sec'y.

May 30.—Canajoharie, N. Y.—Decoration Day shoot of the Canajoharie Gun Club. Targets. Charles Weeks, Sec'y.

June 1-2.—Peekskill, N. Y.—Trophy shoot, Hudson River Trap-Shooters' League, on the grounds of Peekskill Gun Club. J. B. Rogers, Manager.

June 2-3.—Alton, Ill.—Second annual bluerock tournament of Piase Gun Club. F. C. Riehl, Sec'y.

June 7-8.—Ottawa, Kans.—Annual tournament of the Kansas State Sportsmen's Association. W. L. Beardsley, Sec'y-Treas.

June 7-8.—Indianapolis, Ind.—Annual tournament of the Indiana Trap-Shooters' League, of Indiana, on the grounds of the Limited Gun Club.

June 8-9.—Findlay, O.—Annual tournament of the Magautrap Gun Club. O. B. Marvin, Sec'y.

June 8-10.—Parkersburg, W. Va.—Second annual tournament of the West Virginia State Sportsmen's Association. Address all communications to L. O. Bower, Sec'y, Sistersville, W. Va.

June 14-15.—Stillwater, Minn.—Tournament of the Stillwater Gun Club.

June 15-16.—Portsmouth, Va.—Tournament of the Interstate Association, under the auspices of the Portsmouth Gun Club. W. N. White, Sec'y.

DRIVERS AND TWISTERS.

Club secretaries are invited to send their scores for publication in these columns, also any news notes they may care to have printed. Ties in all events are considered as divided unless otherwise reported. Mail all such matter to Forest and Stream Publishing Company, 346 Broadway, New York.

The second annual amateur tournament of the Peru Gun Club, of Peru, Ind., fixed for April 27 and 28, has ten target events in the programme of the first day, and twelve in that of the second. The entrance is \$1, \$1.50, \$2 and \$2.50, accordingly as the number of targets in the event is 10, 15, 20 or 25. Shooting commences at 9 o'clock, but shooters arriving on any of the trains arriving before 10:15 A. M. will be permitted to shoot in the first event, so that they may contest for the average prizes. Targets 2 cents each, with the qualification that \$2.50 for each 1,000 targets thrown in the programme events will be set aside for equal apportionment among the four guns making the best general average for all programme events of both days. This reduces the price of targets to 1 1/4 cents. It is conservatively estimated that 15,000 will be thrown in the two days. All purses divided 35, 30, 20 and 15. Guns and shells shipped to F. A. Haimbaugh will be delivered to the grounds free of charge. Manufacturers' experts will be barred from the purses of the regular events, but will be allowed to shoot for targets, and will be afforded every opportunity to display their goods and show their quality as agents. The club mentions that special railroad rates have been secured for those who will attend. Mr. John Parker, of the Peters Cartridge and King's Smokeless Powder companies, will be the manager, and his well-known skill and efficiency insures expert management. For further information address J. L. Head, Peru, Ind.

The programme of the tournament of the Chambersburg Shooting, Fish and Game Protective Association, Chambersburg, Pa., May 3 and 4, provides eight events, six at targets, two at live birds on the first day, six on the second, of which two are at live birds. Of the target events of the first day three are at 10 bluerocks, \$1; three at 15, \$1.50. Of the two events at live birds the first is at 7, entrance \$5. The second at 10, entrance \$7.50, birds included in each event. Extra events will be shot to suit the shooters. On the second day two events are at 10 targets, one at 15, and one at 25, the entrance to the latter being \$1.50, optional sweepstakes \$2.50. This is a merchandise event. Two of the live-bird events have the same conditions as the two of the first day, besides which a miss-and-out, \$1, birds extra, will be shot. Dropping for place will not be tolerated. The tournament will be held on the grounds of the Association, on Fifth avenue. Targets will be thrown from nine traps. Purses will be divided 40, 30, 20 and 10 per cent. Manufacturers' agents are barred from sweepstakes and purses, but are welcome to shoot for targets only, and to display their goods. Shells shipped in care of A. L. Solenberger, Chambersburg, will be delivered at the grounds free of charge. Mr. M. R. Rhodes, assisted by F. P. O'Leary, will manage the tournament.

The Noxubee Gun Club, of Macon, Miss., has issued the programme for its tenth annual tournament, May 17 to 19, inclusive. It is open to the world, though manufacturers' agents and experts will be handicapped. Gentlemen who come under that classification can learn as to their handicaps by writing to the manager. The club announces that it will add \$500 in cash and merchandise prizes, and there are seventy-five of the latter, with probabilities of more. Dropping for place is prohibited. Ten-gauge guns and black powder barred. All ties divided, except ties for merchandise, which may be divided or shot off in the next event. Targets at three cents deducted from purses. Class shooting, 50, 30 and 20 per cent., except when otherwise stated. The twelve events of the first day are at 10, 15 and 20 targets, entrance varying from \$1 to \$3, the total entrance for the day being \$20.60. The second day's events also number twelve, six of which are at 10 targets, three at 15, one at 20, one at 25, one at 5 doubles, and the total entrance for the day is \$17.85. There are ten events on the third day, from 10 to 25 targets, total entrance \$13.75. Ammunition shipped in care of the manager, C. M. Scales, will be delivered free on the grounds.

At times when the trap-shooting world has well nigh forgotten Dr. Carver, he toots a mighty blast of his horn and asks to be gazed upon and his toots heeded by the world. His last toot is somewhat overdue, but in composition it is of the same classical excellence as its predecessors, and also it is the same in theme. It is on quite a broad principle, \$10,000 to bet, but not a cent for deposit. However, the gentle Doctor's latest is couched in the pure and elegant diction for which his writings are so justly famous, and he also is lavish in generous praise of his contemporary shooters, as is becoming a man who never made a bluff, nor never evaded a chance to compete, nor never was defeated, nor never worked a paper for free and easy advertising of himself and insolent belittling of his fellows. About a dozen words with a deposit would do much toward insuring a match if it were really desired, but a million words with no deposit generally are measurable as so much rant. Space is too valuable in FOREST AND STREAM to bestow on such vapors.

At a shoot on the grounds of the Country Club, Winchester, not long ago, a ludicrous incident was witnessed by those present. On the fence are several wooden decoy pigeons, placed thereon for the purpose of inducing the birds to start quickly for the boundary when they take wing. The dog which was doing the retrieving cast an unholy eye on the decoys, and in an evil moment ran swiftly to the fence and sprang at one of them, striking hard against it with his teeth, knocking it off. Astonished, but undismayed, he charged at another, with a similar result. The second attempt was sufficient, and he desisted from further attempts. If he could think over the matter calmly, he was thereafter more charitable in his thoughts of the shooters who missed such hard birds.

While at the Boiling Springs Gun Club's shoot last week on Wednesday, Mr. Edward Banks and Mr. T. W. Morley arranged a series of matches, the first of which takes place this week on Thursday. Mr. Banks shoots at 100 targets, Mr. Morley at 105, the latter thus being conceded a handicap. The first will take place at the Lyndhurst grounds; the second at the Boiling Springs Gun Club's grounds. This should be a very closely contested match. Both parties to it have been shooting in very high class form of late, so that high scores may be expected.

Mr. A. C. Paterson, of Chicago, has a busy season ahead of him, if he preserves possession of the recently emancipated Chicago challenge trophy. He is the recipient of several challenges, inviting him to try it all over again—a state of affairs which is most commendable, and which is the true vitalizing condition appertaining to any trophy. A challenge trophy which is not challenged has about as much significance as a challenge without a deposit—a bob-tailed Carver challenge, for instance.

The scores made in the match between Gilbert and Parmelee, 86 to 82 respectively, under the conditions mentioned by Mr. Hough in Western Traps, were excellent, and amply prove that both men are great shooters. However, if John Watson would divide up the wind so as to give a fair division to each big event on his grounds, instead of exhausting a month's supply in one day, it would be more equitable to all.

The New Jersey State Sportsmen's Association will call a meeting of the Association to take action in regard to postponement of its tournament till early fall, the present dates, May 17-20, having practically been abandoned. Thirty days' notice is necessary under the constitutional provision governing the matter, so that the meeting will not be held earlier than the latter part of May. The revivification of the Association has not been an easy matter, and the inheritance of cups with string attachments, etc., has hampered the workers very much. The better way to dispose of the whole matter would be to dump the rubbish of the past into the past and begin a new Association, free from prejudice, ancient troubles and constitutional apathy.

One of the processes of ratiocination which puzzles the new editor of this department is that exhibited by the secretaries of numerous gun clubs who are preparing programmes of their respective tournaments. In the same envelopes are reading notices varying from ten to a half column in length for publication in our columns, which we are pleased to publish gratuitously, but in separate letters are requests that we take a page or half page in the programmes, paying for the same at full regular rates. Aside from the material value of the advertising in our pages and in the pages of a programme, there is a lamentable angularity of vision in observing meum et tuum in the matter.

The Troisdorf cup will be competed for at the Saturday shoot of the Brooklyn Gun Club this week. There will be other events quite up to the standard of interest which John Wright, the manager, always infuses into these shoots, several useful articles of merchandise being a reward for those who prove that they deserve them. Keep in mind the Brooklyn Club's one-day shoot on Saturday, April 29.

On Saturday of this week the April cup of the Bergen County Gun Club will be contested for on the club's grounds, Hackensack, N. J. Shooting will begin at 1 P. M. This event will be at 25 targets, \$1 handicap, the cup to become the personal property of the winner. Sweepstake events also will be shot. The club extends a cordial invitation to shooters.

This week the popping of guns at Brockton, Mass.; Lincoln, Neb.; St. Louis, Mo.; Hingham, Mass.; Wichita, Kans.; San Antonio, Tex.; McKeesport, Pa.; Wallace, Idaho, and places of lesser note is sweet music to those who enjoy the battle, not from afar off, but where the fray is thickest.

Under date of April 18, Mr. Frank B. Tracy, secretary, writes us as follows: "The Owego Gun Club have selected May 25, 26 and 27 as the days for its next shoot. The 27th will be devoted to live birds, and the 25th and 26th to inanimates from our magautrap. Programmes will be sent you when printed."

The Rockaway Park Rod and Gun Club will give its last shoot of the season on the first day of next week, and will endeavor to make that event a pleasing finisher to a pleasant series. The sweepstakes are low, targets are \$1.50 per hundred, and a good time is sure.

BERNARD WATERS.

ON LONG ISLAND.

MONEY DEFEATS EDEY.

April 16th.—A race of exceptional interest was shot at Garden City, L. I., on the grounds of the Carteret Club, April 16th, between Capt. A. W. Money, of the American E. C. and Schultze Powder Co., and Mr. W. S. Edey, of New York. The conditions were 100 live birds, \$250 a side. Capt. Money stood at 23yds., and conceded 6 misses as kills. Edey stood at 27yds. It was a very close race, and up to the very last bird it was impossible to forecast the victor with any reasonable degree of certainty. Indeed had not Mr. Edey lost his last bird dead out of bounds, the race would have been a tie. That bird, hard hit, but still strong and vigorous, barely managed to clear the top of the boundary fence, where it fell to the ground and died. The score was 94 to 87 in the actual number of birds killed, but with the 6 misses added as kills to Edey's score, as per conditions of the match, the result was 94 to 93, Capt. Money thus winning by one bird.

There was a stiff southwest wind blowing in the first part of the race, but it gradually died away to almost a calm after the first 50 birds had been shot. A thinly clouded sky obstructed the sun's rays for a few minutes after the race began. The sun then shone clear and hot for a half hour, after which the clouds again deadened its brightness. The race began at 10:33 and ended at 12:24.

The short boundary, 30yds., made quick and accurate work absolutely necessary. Capt. Money shot with excellent judgment on birds fast or slow, and although the birds were a very good lot he rarely allowed one to become hard. Edey shot an excellent race, but he made hard shooting some of the time by delaying a moment too long. A number of the birds which he lost were hard hit, but died out of bounds.

After the match there were not a sufficient number of members to hold the club's cup shoot, so it was postponed. A match between two of the club members and a few sweeps pleasantly filled up the hours of the afternoon.

NEW UTRICHT GUN CLUB.

Brooklyn, N. Y., April 16.—This was a perfect day for shooting, and fourteen members of the New Utrecht Gun Club took part in the regular bi-monthly target shoot at Woodlawn. A good breeze from the northwest made the targets somewhat erratic, and poor scores were made at the start, but all improved in their work later on. Mr. G. E. Greiff presented a cup to the club, to be known as the Troisdorf cup, and to be competed for at each target shoot under the same conditions and handicap as govern the club shoot. The cup will become the property of the member scoring the first four wins. P. E. George secured the first win for the Troisdorf cup.

Platt Adams won the club cup. Event No. 1 was the Troisdorf cup event, 25 targets, handicap allowance; No. 2 was the club cup event, 15 singles and 5 pairs; Nos. 3 to 7 were at 10 singles. The scores:

Deacon, 11110101101101111101111	—20
W H Thompson, 311100011110110100100011111	—18

The Macon Tournament.

The first target tournament of the Interstate Association for the season of 1898 was held in this city April 13, 14 and 15. Tuesday afternoon, April 12, practice shooting was indulged in by the members of the local club and such visiting shooters as had arrived, and seven 15-bird events were finished, with about fifteen shooters, five over the old, tried and true expert traps, which have served so faithfully under Manager Shaner's management for so many years past, and two over the magautrap, which the local organization has lately placed in position, and it is not saying too much to say that the old expert traps used by the Association never worked better, and shows what good care they have received at Manager Shaner's hands in their long years of service.

The tournament had quite a strange and ludicrous introduction. Paul North had dropped into town early in the morning, and finding Mr. Shaner had gone out to the grounds Paul thought he would also go out, and being a very great walker, and thinking he could find the way without any trouble or assistance, he decided to walk. They have been having a slight small-pox scare here for some little time, and the city has established a camp for the afflicted on the Fair Grounds, on a portion of which the tournament was held, and Paul in his meandering around, looking for Mr. Shaner, and the well-known tent of the Association, saw two or three tents pitched on one side of the grounds, and made a beeline for them, but was stopped by a man who cried out, "Go back! Go back!" But Paul, nothing daunted, insisted on going ahead, saying he was looking for the shooting grounds, whereupon the guard said, "This is no shooting ground, but a small-pox camp," and a moment or two afterward Elmer Shaner and Jim Baker noticed a large cloud of smoke coming across the grounds, and presently they made out Paul's form tearing down the race track, and emerging from the dense volume of smoke, which was all caused by his burning the air in his anxiety to put distance between himself and the small-pox camp. Now, if any one for a moment imagines that Paul is not an expert sprinter they have only to mention small-pox, when they will at once change their mind.

As mentioned previously, the traps were located on the Fair grounds, located about a mile from the center of the city, and they faced almost due east. The background was not of the best, as the grounds are inclosed by a high board fence, having been used for a baseball grounds. Left-quartering birds from No. 1 trap were thrown nearly to the fence, while right-quarterers were rendered extremely difficult on account of a dense grove of pine trees just beyond the fence on the right.

A more charming city for a tournament than Macon could not have been selected. He who has not heard or read of Macon and its many beautiful women and open hospitality has lived in vain. The city has a population of 38,000 to 40,000, and is steadily growing. It is one of the thriving business cities of Georgia.

This was the first tournament given by the Association since the new rule allowing paid representatives to shoot for birds only was adopted, and it has been clearly demonstrated that it was a move in the right direction, as a glance at the scores for the first day will show. With twenty-five shooters participating, eighteen shot the programme through, six of which were trade representatives, and the other twelve shot for the money in every event. How different would have been the result had there been four or five trade representatives present shooting for the money, and experts at that. Not more than five or six would have shot the programme out, except for the targets. You could hear expressions of approval on all sides, and it will grow in favor as the ruling become more thoroughly understood.

The trade was represented by Col. A. G. Courtney, of the Remington Arms Co.; A. W. du Bray, of the Parker gun; H. P. (Du Pont) Collins, of the Du Pont and Hazard Powder companies; U. M. C. Thomas, Union Metallic Cartridge Co.; Paul North, Cleveland Target Company, and J. H. Mackie, King Smokeless and Peters shells.

The visiting shooters from out of the city embraced Messrs. J. T. Anthony, J. W. Todd and B. W. Sperry, of Charlotte, N. C.; Col. Thos. Martin, Bluffton, S. C.; Capt. G. H. Swan, Geo. Peterman, John Wohlman and Joe Peters, of Charleston; Henry Meinert, Marietta, Ga.; W. P. Woodcock, Danville, Ky.; Dr. Henry, J. J. Garrett, Decatur, Ala.; R. G. McCants and M. L. Rice, Greenwood, S. C.; and F. G. Byrd, A. S. Hook, J. E. Avery, E. Crabb, C. Everett, from Atlanta, those from Greenwood and Atlanta having arrived in time for the second day, while Irby Bennett, of Winchester Arms Co., who was detained by important business matters, arrived in time for the live-bird day. Messrs. Etheridge, Baker, Bowdre, Greer, Holt, Hardeman, Wasner, Williams and Harris represented the home club.

The cashier's office was looked after by Mr. Walter Huff, assisted by D. W. Hill, while B. C. Epperson looked after the pulley box.

The trapping was done by colored men, and there was no cause for complaint on the part of the shooter. Taking it all in all, everything worked as smooth and harmoniously as could be desired by the veriest crank, and it was one of the most pleasant and successful tournaments ever held.

It is very seldom that you will find twenty-five shooters who will average as closely as those who shot on the first day, as a glance at the scores will show.

John W. Todd, of Charlotte, and Capt. Swan tied for first average with .876 per cent, Francis second with .853, and A. G. Courtney and T. Thomas third with .841. The day opened fair, but with rain threatening, and about 11 o'clock, when five events had been shot, it began to rain, and continued during the remainder of the day, but did not interfere with the shooting, and after the first five events were finished on the upper set of traps, event No. 6 was shot over the magautrap, when we again returned to the other traps on account of covering for the boys from the falling moisture, and the programme was concluded by 3 o'clock, after which an extra 15-bird event was shot on the set of expert traps, and one of the same kind over the magautrap, the latter being shot in quite a heavy rain. The scores for the first day follow:

THURSDAY, SECOND DAY.

The day opened bright and clear, but rather cool for this section and season of the year, and a stiff breeze blew during the entire day, which accounts for the low scores, and not a single straight was made during the entire day's programme, 18 being top score in the 20-bird events, and 14 in the 15-bird events. Five events were shot over the expert traps and the programme concluded over the magautrap. Rain began falling about 11 o'clock, but did not interfere with the shooting, and the programme was finished by 3 o'clock. Paul North made the only straight of the entire day, which was in an extra 15-bird event over the magautrap. Col. Courtney won high average with 141 out of 170, .829 per cent.; Peterman second with 140, .823 per cent, and North third with 138, .811 per cent. The scores follow:

FRIDAY, THIRD DAY.

This was devoted to live birds, the programme embracing one 5-bird, one 7-bird and two 10-bird events, and the day was all that could be desired, with a good wind to help the birds, and the birds were all first-class. All the shooters stood at 30yds.

The scores speak for themselves: No. 1 was at 5 birds, \$5; No. 2 was at 7 birds, \$7; Nos. 3 and 4 were at 10 birds, \$10.

Kilbourn 22222112222222-
C. R. MIZNER

Erhardt's Annual.

ATCHISON, Kan., April 15.—Lou Erhardt sustained his reputation for conducting successful tournaments by demonstrating to the doubting ones that it is possible to have a large attendance at a strictly amateur shoot. This is a new departure from the old and established custom of open-to-all shoots. Many predicted all sorts of unsuccessful things for this venture, which, however, they will now have to retract, or lose their reputation as prophets. Be this as it may, the tournament was a decided success, and exceeded anything in the way of attendance at a target shoot in the West or South since the last San Antonio Midwinter.

The gathering was truly a representative one of the amateur shooters of this great and growing West. Erhardt has conducted several tournaments, at which the entries have exceeded this one, but these were of the kind that are designated as "plunder shoots." This shoot was devoid of these "bones of contention," as there was nothing but coin to shoot for here, and this can always be satisfactorily divided. Consequently everything passed off satisfactory, and while there were no big winners there were also none that are apt to become permanently "gun shy" from the fact that the game was entirely too expensive, and it is safe to predict that there are none among those who were present who will not be found here again next year, when Airy will as usual be doing business at the old stand. Those who came here with the expectation of winning big money were naturally disappointed, as it is a simple matter to figure out that this would be impossible where the programme consists of 15-target events and five moneys; but it must also be kept in mind that this very feature kept many shooting, where otherwise they would have dropped out. The sooner the idea of shooting for profit only is eradicated from the sport, the more popular will it become.

EXECUTIVE FORCE.

Under this head I will briefly refer to the grounds and the manner in which the shoot was run and also those who contributed by their labor to make it a success. The shooting was done on the ball grounds at Forest Park, a place most accessible for this purpose, being reached by electric line. The location is on a high ridge that overlooks the city, and which at once assures a sky background. There were three sets of traps in position, all arranged on the Sergeant system. On two of these the regular events were shot, while the other was used for extras, in which all were allowed to enter. The trade representatives were debarred from contesting for the money in the regular events. The extra set of traps was always well patronized, and there were plenty who were willing to pit their skill against the crackersjacks, and none need to imagine that this class had nice and easy pickings. Jack Parker was manager, as is always the case at Erhardt's shoots, but unfortunately he was a very sick individual during the entire shoot, and should have really been in bed in place of trying to conduct it. A bad case of the grip was what was ailing Jack, and he brought this with him from Detroit. Nevertheless the shoot passed off nicely, as there were others who came to the assistance of the management, as is usually the case under such circumstances. The cashier position was ably and acceptably filled by C. H. Wallingford, of DeKalb, Mo., who, without any assistance whatever, handled the numerous entries with a neatness and dispatch that was commendable.

IN ATTENDANCE.

There were Messrs. C. E. Latshaw, Geo. L. Carter and George Rogers, Lincoln, Neb.; W. H. Herr and M. S. Kempton, Concordia, Kans.; Frank Hodges and W. L. Lemon, Olathe, Kans.; George Hall, Geo. W. Stevenson, Jr., A. H. Barlow, and H. F. Talbot, Waterville, Kans.; Walter M. Howe, Dave Elliott, C. C. Herman, Chris S. Gottlieb, T. F. Norton, J. W. McCurdy, Chas. Wright, Walter Bruns, J. J. Cornett and W. H. McGee, Kansas City; F. Miller, Berwyn, Neb.; Al Martin, Highland, Kans.; Andy Fulton, Bendena, Kans.; Dan Bray, Syracuse, Neb.; C. D. Linderman, Adams, Neb.; A. C. Connor, St. Louis, Mo.; Geo. Peterson, Coon Rapids, Ia.; C. T. Callison, Cummings, Ia.; H. E. Blasier, Williamsburg, Ia.; W. A. Smith, Greenwood, Mo.; W. H. Allen and J. S. Thomas, Pleasant Hill, Mo.; C. F. Reust, Frankfort, Kans.; C. C. Holzworth (Hayden), A. M. Bernhardt and W. S. Duer, Hastings, Neb.; H. C. Mortenson, Britt, Ia.; C. M. Sumner, Galena, Kans.; W. G. Sergeant, Joplin, Mo.; A. J. Lawton, W. R. Mason, Art. Matthews, D. L. Macaffree, J. W. Garrett, Colorado Springs, Col.; E. M. Fish, (Kabo), C. M. Churchill (Marks), Eau Claire, Wis.; C. T. Percival, W. C. Page and W. Wolfe, Bonaparte, Ia.; G. W. Goff and W. H. Koehler, Leavenworth, Kans.; C. D. Hagerman, Wymore, Neb.; Tom Graham, Rosedale, Mich.; C. B. Cockrell, F. N. Cockrell, J. W. Davis, and Dr. S. Redman, Platt City, Mo.; F. A. Reynolds, Gothenburg, Neb.; Dr. M. S. McGrew, Holton, Kans.; Fred Bohner, and J. W. Den, Arapahoe, Neb.; A. D. Renfro, South Cedar, Kans.; W. S. Allen, Raymore, Mo.; F. R. Patch, Hartley, Ia.; E. D. Trotter, Kingsley, Ia.; L. C. Worthington and W. R. Milner, Des Moines, Ia.; N. D. Gardner and T. B. Curtis, De Kalb, Mo.; H. S. Montgomery, Topeka, Kans.; F. L. Gregg, St. Joe, Mo.; Dr. R. S. Dinsmore, Troy, Kans.; J. Gray, Severance, Kans.; F. E. Ruggles, Jewel City, Kans.; Henry Thiele and Howard Davidson, Junction City, Kan.

The trade was represented by John J. Hallowell, of the U. M. C. Co., Bridgeport, Conn.; J. S. Fanning, of the Gold Dust Powder Co., Batavia, N. Y.; Wm. Crosby, of the same place, who is pushing the Baker gun, and Jack Parker, Detroit, Mich., well known as the shooting representative of the Peters Cartridge and King's Powder companies.

GENERAL AVERAGES.

This is perhaps one of the most interesting features of a tournament, and more attention is paid to this when summarizing on the results than anything else. There was \$50 set aside for general averages at this shoot, which was to go to the seven high guns divided as follows: \$12, \$10, \$8, \$5, \$5, \$5, \$5. Altogether twenty-six shot through the whole programme for the three days, and of all these only one finished with a percentage of 90. Duer by his great shooting on the first day was easily first with a good margin to spare, as he leads his nearest competitor 18 birds. For this display of nerve and skill he receives \$12, and no more popular win could have occurred, so it goes without saying that none envy him his success. The next six high guns are all bunched, only 8 birds separating the second from the seventh, which shows how evenly the contestants were matched. Of those who got a part of this money none finished so strong as Lawton, who finished in fifth place, passing a number when he thought he was hopelessly out of it. This average money kept up the interest in the shoot until the very last, and also encouraged some to continue when otherwise they would have dropped out. This is a thing that should be embodied in every programme.

APRIL 13, FIRST DAY.

The low averages to-day will doubtless be a matter of much comment when read by the shooters who were not present, as one would naturally surmise that in a field of shooters such as are assembled here, comprising nearly all the crack amateurs of the West, many would have a percentage of 90 for the day's shooting. To thoroughly understand the conditions one would have had to be present. Such a gale of wind as prevailed here to-day I have never seen equaled while a tournament was in progress. The nearest approach to this was the weather encountered at Joplin two years ago. Puzzling and deceptive flights will scarcely properly describe the antics of the targets.

One shooter nevertheless came through it all in triumph. He is one of the most gentlemanly and popular young shooters in the entire West—Billy Duer, of Hastings. To make an average of .926 on such a day is certainly a most extraordinary piece of shooting, and is the most creditable performance that has come under my observation for quite a while. The number of targets that separate him and the nearest of those who are tie for second position will of itself attest this. Four are tied for second position, but 13 birds separate them from Duer, while their average is but .84, which is very good under the conditions.

The other creditable performance of the day was Gottlieb's 35 straight; he started off with this, but was unable to maintain it. Reust wound up with a run of 34 straight, which remained unfinished.

The attendance was good. Seventy-five participated, of which number fifty shot through the entire programme. The greatest entry in any event was sixty-eight, and the least fifty-six. Keith-

line, Jacobson, Duncan and Gregg shot in only one event. The other seventy-one are shown in the table attached.

The weather was bright, though the wind referred to above made it cold and disagreeable.

APRIL 14, SECOND DAY.

The gale of the previous day had almost subsided, which had a noticeable effect on the shooting, for to a great extent the improved averages of the day can be attributed to this. In the morning it was still blowing some, but by the afternoon the wind had entirely subsided. This made it an ideal day for shooting, as the sun shone bright and warm. There was a marked increase in the attendance, something that is rarely the case, as one seldom sees the entry list on the second day of a tournament exceed that of the first. To-day there are as many who reached the 90 mark as there were 80s on the first. In this lot Worthington and Fanning tied for high honors; in the next place there were four—Garrett, Kabo, Reust and Crosby. Three others—Duer, Herr and Cornett—just scored an even 90. There was an abundance of straight in nearly all the events.

The largest number of entries in any event was eighty-three, the first. This was fifteen in excess of the highest of the previous day. There were not quite as many who shot through, but this came about for the reason that the supply of birds on the grounds became exhausted, and many would not wait until others could be brought from the city. This may seem rather strange, though it is excusable because the supply on the grounds was larger than the number used the day before, and as mentioned above, it is rarely the case that more targets are used on the second day of a shoot. In all there must have been more than 13,000 targets used during the day. Aside from the regular events, extras were continually in progress on a separate set of traps.

FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

TERMS, \$4 A YEAR, 10 CTS. A COPY.
SIX MONTHS, \$2.

NEW YORK, SATURDAY, APRIL 30, 1898.

VOL. L.—No. 18.
No. 346 BROADWAY, NEW YORK.

The FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. The editors invite communications on the subjects to which its pages are devoted. Anonymous communications will not be regarded. While it is intended to give wide latitude in discussion of current topics, the editors are not responsible for the views of correspondents.

Subscriptions may begin at any time. Terms: For single copies, \$4 per year, \$2 for six months. For club rates and full particulars respecting subscriptions, see prospectus on page iv.

All day there was the deepest silence in the desert; but, as the shades of night came on, the scene became animated, and even noisy. Aquatic birds arrived in countless troops, and soon millions of hoarse and screaming voices filled the air with their wild harmony. Tartary is peopled with these migratory birds; and, as we contemplated their innumerable battalions wheeling about in the air, and thought of the many countries they had traversed, we used to please ourselves by imagining that some among these myriads might have passed over the lovely soil of France, and have sought their food in the plains of Languedoc, or in the mountains of the Jura. Huc's Tartary.

THE WAR AND YACHTING.

THE developments of the past few weeks, bringing the country actually to a state of war, have wrought a great change in the yachting situation, so that it is impossible to predict what the outcome may be. Up to a short time the outlook was promising enough in a way, with nothing magnificent or sensational in store in the way of international racing or big boats, but a certainty of good sport throughout the country among yachtsmen at large and in the smaller classes. On Long Island Sound the indications were for a lively and exciting season under the management of the Sound Y. R. A., with plenty of racing in the regular classes of 42ft. and under, and an unusual amount of sport in the new one-design classes. About Boston the conditions were equally favorable for a good racing season, with more new boats than about New York in the regular classes, and with some extra interest added through the Quincy Y. C. cup. In the West and on inland waters generally the outlook was good for yacht racing in all the smaller classes.

It is true that the prospects of sport on the coast in the large classes were even worse than usual, a little desultory racing on the part of Colonia, Amorita, Wasp and Queen Mab, a quiet and uneventful cruise of the New York Y. C., and possibly a mild attempt at class racing by Syce, Kestrel and a new boat in the 51ft. class being all that could be hoped for. Much as this state of affairs among the large yachts is to be regretted, it is obviously unavoidable under existing conditions, and as a compensation for the dullness and stagnation in this branch of yachting there has been an unwonted activity both in the domain of the smaller yachts and in the peculiar interest in the sport at large, as well as in the efforts of individuals, clubs and associations to extend and improve it.

The beginning of a war of uncertain duration has already so affected yachting that it is impossible to predict what the result may be. The developments thus far are hardly of a nature to warrant such an extreme step as that of the Larchmont Yacht Club in calling off all the races set for the season of 1898, and we hope and believe that such a measure will prove unnecessary. No similar action is thus far contemplated by the Massachusetts and Sound associations.

Of course, if the war is of long duration, there will be no thought of yachting. Many of the yachtsmen are already enrolled in the navy or army, and the indirect influences of a lengthy and serious war will of themselves put a stop to all sport. At the same time the chances now are that the war will be a brief one, and that the check to yacht racing will be but temporary, and affecting only the first part of the season. The greatest effect will be felt in the steam yacht fleet, through the permanent withdrawal of a number of the largest yachts.

With hostilities actually begun by the capture of seven or eight Spanish merchant vessels by the United States, some anxiety is felt for the safety of American yachts, of which a number are now cruising in the West Indies or the Mediterranean. The big Nahma, sister to May-

flower, now on her way from New York to the Clyde, would make a fine prize for Spain, as would Varuna, last reported at Constantinople on April 11, and Margarita, now in the Mediterranean. Of the smaller steam yachts in the same locality are Narada, Andria and Arcturus. Norma (schr.) left here for Naples on April 11. Fleur de Lys was at Horta on April 5. Intrepid (schr.) has returned to New York from Nassau, and the steam yacht of the same name is at Tebo's, where she has lain all winter, though reported as in the West Indies. May, Barracouta and several other steam yachts are now in the West Indies. The best that can happen to the yachts mentioned is that they may be tied up for an indefinite time in some safe neutral port. Nahma has been reported safe at Gourock on April 23. Andria put to sea from Leghorn on April 21.

SNAP SHOTS.

IT is a well-established principle, recognized perhaps since Noah let the animals out of the ark, that when once a wild creature which has been held in captivity recovers its freedom, and passes beyond the possession and control of its captor, it is no longer his property, but will belong to anybody who may capture it. So familiar is this that in these days a counsel who advises his client to the contrary must be inexcusably ignorant. Yet we continue to hear of squabbles in the courts between losers and finders of wild animals.

In 1896 some of the seals confined in a pond at Glen Island, a pleasure resort in Long Island Sound near New York, escaped into the Sound, where subsequently one was captured by a fisherman, who sold it to Mr. Jas. A. Bradley, of Asbury Park, N. J. The seal was exhibited as an attraction at Asbury Park through the summer, and was sent for the winter to the National Zoological Park in Washington. Here it was seen by Capt. Mullet of New York, who recognized it by certain marks or abrasions on the fins as one which had escaped from Glen Island; and he laid claim to it as his property. When his ownership was disputed he brought suit for \$500 damages; and the case came up in the District Court in this city last week. Justice McKean held that there was no cause of action, since the seal, having escaped to its native element, was no longer the property of Capt. Mullet. This was no more than the Captain's lawyer should have told him in the beginning.

It will not do to be severe on the attorney in this private case, however, when we have just had presented to us a national blunder of precisely the same character, and involving an enormous sacrifice of public funds. In the Senate of the United States a resolution was introduced one day last week to pay Great Britain the sum of more than \$420,000, awarded by the Paris Tribunal as indemnity for our seizure of British sealing vessels in Bering Sea. The claim of the United States was that as we owned the Aleutian Islands, the breeding grounds of the seals, we had property rights in the seals after they had left our territory and betaken themselves to the high seas. Acting upon that claim, we sought to enforce our rights by seizing the sealers, which in the open sea were beyond our jurisdiction. The Aleutian Islands seal case goes on all fours with the Glen Island seal case; the same principles apply; when wild creatures escape beyond control of their former possessors, all rights of property in them terminate; and if it is sought either by individuals or nations to enforce rights which do not exist, the courts will find against them.

If the United States Senate can take time in the intervals of the conduct of the war to pay some attention to a defense of the forestry interests of our own country, it ought to put a damper on the plot which now menaces the forest reservations. An amendment has been offered in the Senate, to the Sundry Civil Bill, suspending indefinitely the orders creating forest reservations, proclaimed by the Executive on Feb. 22, 1897. This suspension, if put into effect, will amount to a virtual abandonment of the reserves forever, or at best until the timber thieves who are back of the suspension job shall have completed their ravages. The American Forestry Association has prepared a timely protest against the threatened nullification of the national forest reservation scheme; and has embodied its protest in

a memorial praying that if the surveys of the territories concerned have not yet been completed, so that more time shall be required for them, the suspension shall be limited to one year only, and shall not be made indefinite. This action of the Association is timely and patriotic. In times of war the timber plunderers will find their safest opportunities for despoiling the public domain; they are intent on picking Uncle Sam's pocket while his back is turned.

Human nature is pretty much the same the world over. The non-resident sportsman discrimination in our own country has its counterpart in far-off Ceylon, whose Game Protective Society is agitating against the foreign visitor. Complaints against the globe trotter, the secretary reports, are frequent and emphatic, and the general opinion among the members of the society is that the present facilities for sport afforded to visitors to the island should be discouraged by considerably increasing the cost of a license to such strangers. The complaints are doubtless well founded; and the sportsman from these United States visiting Ceylon would willingly pay his shot. He could indeed expect to receive, being a globe trotter far from home, no other treatment than that of an alien. But so long as one remains at home under the Stars and Stripes he is everywhere conscious of "the sublime fact," as Commissioner Carleton, of Maine, put it the other day, "that the citizens of all the States are citizens of our common country." And when going from one State into another he runs up against a non-resident hunting tax, such as they are now proposing for Maine, the sublimity of the thought receives a painful jolt.

Ceylon affords another illustration of the exercise of the principle of game protection which is coextensive with the dominion of Great Britain, and it is interesting to note that in that far-away land they recognize that the traffic in skins and horns is the factor of the problem most difficult to deal with. The skins of certain Ceylon deer are the most valuable received in European markets, and in consequence of this trade the species is threatened with extinction. The adoption of the Plank form is in order in Ceylon.

By the recent death of Dr. George W. Massamore, of Baltimore, the sportsmen of Maryland have lost one of the most earnest, active and efficient workers for game and fish protection in the history of the State. As secretary of the Maryland Fish and Game Protective Association Dr. Massamore stood before the people as the actual working agent of the Association. He was prompted by a sincere desire to promote the public good; and he possessed in addition to the very essential qualities of determination and perseverance a fund of common sense which never failed to stand him in good stead. The organization of the Maryland Association was largely due to his initiative; and its work was in his hands. His services in the public interest should be remembered with gratitude.

We have all heard the story of the fellow who told how when he was hoeing corn one day he caught a deer stalled in a snowdrift. He was outdone the other day by Judge J. Frank Fort, of Newark, N. J., who in a written opinion sapiently decided that the defendant in a game law prosecution had a right to go gunning on Sunday to protect his father's sprouting corn from ravages by crows—in September. It was this same Judge Fort also who, according to the Paterson Chronicle, gave his opinion that the law forbidding possession of game in close season was unconstitutional. Game cases are of minor importance compared with many others which occupy the attention of the courts. Heaven help the victims of Jersey justice who fall in the way of such judicial blundering and crass ignorance.

Martha's Vineyard has been stocked with pinnated grouse, which have been put out to replace the native heath hen. The heath hen, a correspondent writes, is practically extinct on the island, one chief cause leading to this result being woods fires which have swept over the breeding grounds. It is asked that visitors to the Vineyard shall respect the newly introduced grouse and give them immunity.

The Sportsman Tourist.

"Hark Back."

YOUR well-trained hunter has carried you, to your entire satisfaction, over a sporting country with a fast pack of hounds, a good fox in front. Bank and ditch, stone wall and brook safely past, there is a "check." Your horse is refreshed, yourself not sorry for time for reflection. A cast to right and left is made in vain. The master of foxhounds gives the command, "Hark back!" and soon the eager hounds take up the scent; you tighten the girths; your horse settles down to his work with renewed vigor; you are once more in the "ruck;" you follow on to the death. No such question remains in your mind as "Is life worth living?"

With feelings such as these, as an old sportsman who had gone far afield to fish every available salmon river, every well-known trout stream, having shot his legal number of moose, caribou and red deer, within reach of his wigwam in eastern Canada, I succeeded in securing a few days for reflection, rest and relaxation amid the "toil and moil" of this period of unrest of the nineteenth century; I decided to "hark back!" and take a canoe voyage of about 200 miles in a well-known chain of lakes in New Brunswick—the Squattick, Toledi, and Temiscouata—connected by the Madawaska River. Here

"At each sweet pause
From care and want and toil,
When dewy eve her curtain draws
Over the day's turmoil."

On the principle of distance lending enchantment to the scene, I had previously passed these lakes by on the

be called, over hill and dale, and through alder swamp, the whole route being through ever-varying forest. At last, before night set in, the cheering sight of the lake caused us to quicken our steps until we reached the spot selected for our first camp.

It is needless to describe the theory and practice (the result of experience) of pitching tents (two), collecting fir boughs, cutting firewood, and settling down for the night. Oh, the delight of the first night in camp. The first meal has been a veritable feast. It may consist of the simplest of camp rations, but memories of that meal linger long in the heart of man, while the choicest cooking of New York's palace hotels or its most fashionable clubs is soon forgotten.

After such a camp repast you lie flat on your back on the spruce bough couch; smoke from the fragrant weed curls slowly from your mouth; you build delightful castles in the air, and you are in no hurry to knock them down. Here no tumult of sounds, the constant rumble of street cars or other motors, the shrieks of peddlers or newsboys, or the questionable music of street organ or street band, assaults your ear. The noiseless moose bird perches on the bough above your head. Your overtaxed brain is relieved from strain; worry has fled to the winds; you are out of reach of telegraph or telephone, newspapers, or hourly mail delivery; you are a free man. Oh, the delights of freedom in this free country after such an evening of repose! How sweet the sleep! How fresh the awakening! How fit the physical frame after the morning bath and the hearty breakfast. The breaking up of camp is not a tedious operation. There is always a sigh as you leave behind your picturesque camp; each spot on which you pitch your tent seems more picturesque than its predecessor.

Now we are busy with the welcome paddle in crossing this pretty lake, and you wonder why it received so sug-

this ideal means of transport, a milicete canoe. You fish or let it alone at your sweet will. This is the poetry of existence.

Before reaching the lake the stream widens, and is less rapid. The waterlily, affording ample concealment for trout, is seen in abundance now in full bloom of autumn. Here by long casts from the canoe we picked up as many trout—several of them large—as the most ardent admirer of Izaak Walton could desire—and it was only the sun's sinking to rest behind the forest-clad hills that reminded us that we must "fix camp" ere night set in. Our camp that night at the head of the lake after a day full of enjoyment, ending with a swim in the lake, was one long to be remembered.

We were desirous of camping next night on the shores of Squattick Lake No. 3, within sight of Sugar Loaf Mountain, of which we had heard much regarding its beauty, as we had heard much too of the large trout in that lake. We therefore broke camp and pushed on at an early hour next morning. We had a strong head wind, and white men and red plied paddles in vain to reach the still waters leading to lake No. 3 before the midday meal, we were therefore forced to seek shelter on the lake shore for that purpose. After the much-needed refreshment we put on a spurt, and were amply rewarded before sun down on suddenly coming in view of Sugar Loaf Mountain. Of the many well-known European and American bits of mountain scenery none have made such a lasting impression on my memory as this Sugar Loaf Mountain, with the deep forest-clad dells and recesses at its base, the most beautiful of the Squattick lakes, studded with islands beneath and the setting sun of early autumn beyond. It required more than one call from our guides to detract our attention from the view, and fix it on the fishing grounds we had approached. Here we made many casts without success.

CAMP AT HEAD OF LAKE.

CAMP AT SUGAR LOAF MOUNTAIN.

other side without a thought. To these happy fishing grounds I bent my steps in September last in search of that well-earned rest and relaxation which can best be found in forest and stream.

All sportsmen know by heart the preliminary details as necessary for the canoe voyage, the autumn moose call or the winter still-hunting of caribou or deer; but few, however, realize the importance of the proper selection of the "companion du voyage"—the comrade in tent or wigwam, on barren or in green wood. This has been brought prominently forward in *FOREST AND STREAM* in the delightful essays on "Men I Have Fished With." I can with truth say that looking backward through a long vista of years of the many men I have fished with, my "pal," my comrade on this occasion, my friend in the hour of need or in the bright sunshine of summer day sport was the "survival of the fittest." When you combine the qualities of keenest sportsman with the rare talents of geologist, entomologist and ornithologist, one skilled with pen and pencil, ever ready with camera and kodak, and possessing the never-failing secret of "how to keep his temper" under circumstances the most trying, you have an ideal man, hard to find, one you are loth to part with. Such a man I found, and sad it was to say the last farewell, as but recently he sailed with his regiment for the West Indies. Let his name here be Blank, though it will ever remain fresh in my memory. Moreover, we were fortunate in the selection of Indians (two)—Michell and Banard. These we secured at the Indian camp near Edmunston.

We made Edmunston our base of operations. Here we secured our supplies; here we obtained the last "tip" as to the killing fly for the Squattick lakes; here in the "coöperative store" of the place, where everything from a needle to an anchor can be purchased, we learnt of the difficulties of the route in prospect. These were painted in the darkest colors, and here one of our Indians drank "success to sport" in the vilest of prohibited liquors. From this point (Edmunston) to Otterburn on Temiscouata Railway, thirteen miles, you have your choice of means of locomotion, road, river or rail. At Otterburn, however, you leave all traces of civilization behind, save the rudely constructed means of transit with man and horse, for our two canoes—a sort of bob-sled with skis attached, built on the river bank while our midday meal was being cooked.

The portage to Mud Lake—prosaic name—is long and tedious, eight miles over tortuous road, if road it can

gestive a name as Mud Lake. Soon, too soon, you learn how to appreciate the name. The steersman in each canoe points to a low mud bank, and again you wonder where is the exit. There is an imperceptible passage through the bank hidden by interwoven alders. Oh, how interwoven! Through these in a narrow stream—if stream it can be called—we push the canoe. We push, we pull, we drag. Again and again a springy alder strikes us on the face or head as it flies back from the bow man. My comrade is put to the test, but he never fails to keep his temper. For four weary hours this "hide and seek" through alder bushes continues, and at last—happily at last—each canoe is carried directly westward and downward by the swift current of a clear stream—one with open gravel banks and gently rising hills. Here the graceful elm and the hardy oak succeeded the network of alders. We can now breathe freely as we glance swiftly down this lovely stream leading into Squattick Lake No. 4 to the cheeriest song of the now happy canoeist.

The only thing to be regretted in this part of our voyage is that in full enjoyment of rapid transformation as compared with the slow progress of our alder bush experience, we passed over without a "try." The gentle angler too must be reminded that at this time of year—early in September—trout are not "grouped" in pools at the mouth of cool springs, as is the case in midsummer fishing, where large "scores" are made, and where the "scales" are often resorted to with the view to the record as regards large trout being broken. No, every inch of water, so to speak, had now to be carefully fished in order to secure a "bag." We found this the case as we pulled up for the midday meal at a lonely spot at a bend in the stream—an ideal trout stream. Here we fished carefully, but the trout rose short, and it required the long cast, and quick striking with frequent change of fly to secure enough pan fish (no large trout) for the meal.

After this delightful break in the journey (we were loth to leave a spot perfect in picturesqueness and affording fair sport) we pushed on in order to reach Squattick Lake No. 4 before night set in. How we enjoyed this "gently down-stream" experience! No hurry or undue excitement; no train to be caught; no business engagement to be kept; no ringing up of "Central," to put you on the track of some unoffending mortal, who, like yourself, prefers peace and quiet to the whirligig of business life. No, you simply move gently down stream in

—the fish merely breaking the water to sport with our fly—until my comrade tried a fly given us by a friend at Edmunston. On this he hooked a monster as compared with any fish previously taken. I made a similar change of fly, with similar success, and soon we had fish and fishing to our hearts' content. At last we pointed the bows of our canoes for the camping grounds, the most picturesque beneath the shadow of the Sugar Loaf Mountain.

After dreams, in which our favorite bits of Swiss mountain scenery seemed blended harmoniously with angling and anglers of Canada, we were early astir, to return to the sport of the last evening. In our eagerness we found that we had long to wait before the rising hour of the slumbering trout. When, however, that hour did arrive we were amply rewarded. After a well-earned breakfast we again returned to the favored spot, and again "in him" was the only audible sound that interrupted our reverie. A sporting friend with two French guides, whom we had expected to meet in these parts, and who had started for this lake from the opposite direction, now appeared on the scene, and after friendly greetings and comparing of notes we were as a party similarly occupied in having excellent sport, when one of the guides discovered a splendid specimen of male caribou, with wide spread antlers, swimming directly toward us. The first impulse at such a time is to seize one's rifle; the second thought is whether it is the close season for caribou. Prudent second thoughts prevailed on this occasion, and we merely admired the scene as this denizen of the forest swam proudly across this picturesque lake, though one canoe party struck out, using every exertion in trying speed with the caribou, and simultaneously caribou and canoe reached the lake shore, when the proud animal leaped gracefully on the bank and was soon lost to sight in the dark forest.

Fain would we linger long on the shores of this lovely lake—I strongly advise the gentle angler not to hurry past such happy fishing grounds. But our limited leave of absence necessitated our pushing on; we therefore struck camp one bright autumn morning and steered our barque for Squattick lakes 1 and 2, pulling up to fish every likely spot, and we were neither disappointed at the sport, nor at the picturesqueness, ever varying, of the country through which we passed. Our midday meal was at the forks, where the Toledi River joins the outlet from Squattick lakes. Here we were having excellent sport with large trout, when a thunderstorm set

in. Such a thunderstorm—rain coming down in bucketsful. Hoping it would clear and knowing of good trout pools at the outlet of Eagle Lake we plied pole and paddle to reach that lake before evening had set in. We accomplished this, but the thunderstorm continued, and in vain we cast our brightest flies—May flies; wings painted red, green or blue would not fetch the trout, so we decided with no angelic temper to spread our own wings as angels, now seriously despoiled by rain, and fly from this spot. In carrying out this resolve we neither left behind the steady downpour of rain nor our much ruffled temper. Down stream—a now swollen stream—we dashed at no ordinary speed, making for a settler's house fifty miles from nowhere at the forks. Nothing so successful as success; we reached it as dark was setting in. There was, however, sufficient light to discover the dirt and discomfort in this hut, 18ft.x18ft., and the presence of ten or twelve brats of boys and girls of ages ranging from one to ten years. You could not take a step to the front without tumbling over a boy or girl. We beat a hasty retreat, and with much difficulty, amid the long-continued thunder shower, cooked an evening

AN IDEAL TROUT POOL.

meal. With the morning dawn, the long-wished-for dawn, there was a clear sky, all evil thoughts had fled to the winds, even the dozen boys and girls, who came to cheer us as we glided down the rapids, or to fling one last stone at us, seemed comparatively clean. Down the Toledi stream we went, through lake and on river; now coming across a flock of flappers; now stopping off to fish; now taking a snap shot at an ideal trout pool—or last, not least, to cook the inevitable midday meal. It was toward evening ere we reached Lake Temiscouata, and we were once more on the outskirts of civilization. Here and there a settler's hut could be seen, and there were evident signs of that spoiler of the picturesque the lumberman's axe. Nothing, however, even the appearance of the railway train from Riviere du Loup, or the advent of a bike on the road on the western shore of the lake, could quite mar the scenery of this grand lake, with hill and dale, forest and stream, as background for its blue waters. Happily in this country we have not yet reached that stage of over-civilization spoken of in Merrie England, where at a bend of a trout stream (the Itchin) the angler sees on a board the advertisement in big letters:

IF YOU CAN'T CATCH 'EM WITH QUILLS
TRY —'S PILLS.

We camped that night on the lake shore opposite the village of Notre Dame du Lac.

We made an early start next morning with the view to reach Edmunston (thirty miles), the starting point of our trip, before sunset. At St. Rose, the outlet of the lake, we were surprised at the large size of the trout taken in the Madawaska River, and from that until we reached Edmunston we were kept busy with rod and landing net. Here at Edmunston endeth, not our first lesson in fishing, but a trip to which in winter evenings or on summer days one can "hark back" to as among the most enjoyable of autumn holidays. MICMAC.

FREDERICTON, March, 1898.

Penobscot River.

Air: Gypsy's Warning.

In thy youth among the mountains,
Thou art but a wayward child;
Ever singing, ever babbling,
To the forest lone and wild.

Grown to manhood thou art mighty,
Fierce and strong, and full of life;
Foaming, leaping, hoarsely shouting,
In the wildest, maddest strife.

But with age thy waters deepen,
Rushing onward, bold and free;
And thy life ends, ebbing, flowing,
Battling with the restless sea.

I was born beside thy waters,
* Where they fall with deafening roar;
And I played in childhood's hour
On thy legend-haunted shore.

Oh, I love the lonely forests,
Whence thy waters rise and flow;
Where the moose and deer are hiding,
Where the pines and larches grow.

Some may sing of Western rivers,
Sweeping broad o'er turbid sand,
But give me thy reckless waters,
"Old Penobscot," thou art grand!

Hermit, in Boston Sunday Globe.

* Old Town Falls.

Mr. Burnham's next paper will deal with Yukon outfitting and personal experience on the trail.

The Island of Marquez.

An account of the first expedition to California, compiled from original sources for children of all ages.

(Continued from page 324).

FOR five days after this there was little to note except the increasing dryness of the country. On the sixth morning Juan sat gazing fixedly, while the pioneers saddled their horses and prepared to march. When all was ready he touched Estrada and pointed in a direction somewhat more westerly than they had thus far come. The party had left the immediate neighborhood of the river on account of the difficult nature of the traveling, but thus far they had been able to meet occasional water holes in the gullies, which were marked by a greener herbage or a different kind of bushes. Now toward the south the horizon seemed smoky, while further west the sky, though hazy, was clear.

Juan pointed south, held the hollow of his hand to his mouth, went through the pantomime of sipping and then shook his head; no water there. Then turning westward and pointing to himself as the guide he showed that they would reach water in one sleep. Estrada, however, did not like to vary his course. He thought he was near the river and could follow it down. Accordingly they started south, Juan sulkily, the rest with the intention of either finding water by midday or then changing their course.

The decision came near being a fatal one. Little by little the sky seemed to become brassy, and the hot air had in it a smell of sulphur. Plumes of smoke and vapor shot up now and then from the level desert ahead, but the sharp-eyed wanderers had caught a distant sparkle as of a pond or lake and kept doggedly on. A light northerly breeze seemed to press back the vapor before them and help the advance. And now it was glaring noon, and just beyond the seeming pond some two or three miles away was seen a hillock about 50ft. high and other small mounds dotted the country all over the southern view. Now and again a feathery crown of vapor would rise from one or another hillock, as they looked, and drift off on the wind. No living thing had been seen that day save a lizard and one hawk that skimmed low over the ground in fruitless hunt. The water skins held store for one night, but they were now partly empty and must be filled at the lake to insure the supply. For an hour or more the band toiled on, the Indian clearly frightened and the priest becoming suspicious of Juan's possible connection with the underworld, and at length they came to the sparkling surface that had lured them on. It was indeed a pond, but what water! Beyond a dirty margin of whitish crust spread a black liquor coated in places with a yellow scum, glittering with rainbow colors as the ripples passed. Even as they stood horror-struck, the hillock beyond the pond sent up a spout of vapor, and dark mud could be seen trickling down its sides. For a moment the fitful breeze veered to the south. The hawk, which had towered for a view, caught a strong whiff of the smoke and came to the ground fluttering and gasping. Even the men were nearly stifled with the sulphur fumes, and waiting for no prayers or exorcisms to take effect they started west. The good father, muttering some remedial texts, picked up the strangling bird and carried him for an hour until he had recovered enough to soar alone, while the men, thankful for their escape, though still anxious for the future, asked themselves whether these hillocks were not the mountains of fire spoken of on the map. Meanwhile they thought more of the Indian's intelligence, and he, with recovered serenity, trotted over the sharp and burning stones, humming in dreary, monotonous recitative some tale of boasting or of magic wonders. As the band lay that night, waterless, but thankful, Estrada agreed with the others that they had seen the ink pot of Satan, and the place is named, as they called it, the "tintero," to this day.

It was during the painful experiences of this day that Father Jayme's courage seems to have faltered for the only time on the whole expedition, rather through a dread of the infernal powers than from any fear of bodily pain. Several times during the advance to the ink pot and its smoking hill he urged the party to turn homeward, quoting the phrase of Vergil, "Easy is the descent to hell. Hard is the backward path." I admit that the text of Martinez must be a little amended to get this meaning, but it seems to be approximately proven. The blunt soldier gives the words of the priest, repeated several times with slight variations, as follows: "Faciles deseeos haber ni sed. Revocar agrado que labor." These words are all Spanish, to be sure, but the sentences are neither idiomatic nor indeed grammatical. The simple chronicler seems to have thought this an elegant way of saying "It is easy to wish not to be thirsty. What (bootless) toil it is to take away contentment." Read the line, however, as it is pronounced and you have very nearly "Facilis descensus Averni, sed revocare gradum hic labor"—a sentence which is not indeed in the Vergilian order, but represents the passage as usually quoted.

The next morning, when the dawn drew its first pale band in the east, the Spaniards were on foot, and waiting for no breakfast started at once, taking advantage of the brisk winter air for a rapid march. The Indian, with much willingness and evidently knowing the country well, took a rapid pace toward some low barren hills looming like a black ribband in the southwest. By 7 o'clock in the morning, when the edge of the sun was just peeping above the desert, they drew near a rocky ravine with a few shrubs in it, when Juan crouched down and pointed eagerly. Bejar was the first to see something moving among the shadows where the Indian pointed, and soon all could distinguish six animals looking very large in the early light. For a moment the Spaniards thought that they had come to a country of shepherds, for the animals looked like common sheep when some distance away. But Bejar drew near to the flock, which stood gazing curiously, and managed to kill one of the females with his match-lock, though he missed the ram with great horns that he aimed at. Martinez calls the game a goat, because apparently of the curving horns carried by the female, and says that they had no wool. Clearly, however, the creatures were mountain sheep, come for

their morning draught to the desert spring, which the travelers soon approached.

Here, with much eagerness, all drank, though the water was still somewhat bitter, and then they cut up the wild sheep and cooked part of it for breakfast, while Father Jayme with fervent thankfulness intoned "De profundis clamavi."

And now, after two days' rest at this spring, Estrada wished greatly to bend his course gradually to the eastward, so as to reach the sea on its western side and be able to guide his steps with better knowledge. He talked much to the Indian boy by signs, for by this time the explorers had learned to understand this method of mute speech pretty well, and to be astonished also at the identity of gestures used to explain the same thing in different tribes—so that many simple ideas could be exchanged by people who understood no word of each other's language.

Juan would not hear of any change of course as yet, but he let his captors (or rather now his companions) know that in four or five sleeps they would reach a region of plenty, which he called Cocopah. So Estrada and his friends decided to let Juan, who had already saved them from perishing on the desert, lead them out of this dangerous place.

In two days of a somewhat toilsome journey the ranges of hills which ridged the level desert began to show signs of vegetation. Cactus, mesal, and various thorny plants familiar already to the explorers in Mexico, began to be scattered more and more thickly over the stony surface; but there was still no sign of human life. The boy Juan, however, jogged stolidly on, as if now sure of his destination, and on the evening of the fifth day the party made camp by a small spring near which were seen traces of fire and a wretched shelter of brushwood. Juan now repeated his word Cocopah with much satisfaction, and made signs to indicate that there was always plenty to eat here, though appearances of the vicinity were not promising. Nor was the welcome of the natives warmer here than elsewhere. Bejar, who had started to look for the horses next morning, was grazed by an arrow from a hidden foe. As he was not armed at the time he came hastily back to camp and reported his adventure. Toward the end of this day's march, which was otherwise undisturbed, another brushwood hut was seen at some distance in a ravine, and with the boy Juan in the lead the party approached and discovered six male Indians (for the squaws, though doubtless present, do not seem to be counted here), who turned out to be Cocopahs, members of the clan which Juan was seeking. The savages were at first much startled, but after exchanging some discourse, which sounded like grunting, with the boy, they resumed their composure. It seemed from Juan's imperfect account, for he now pieced out his gestures with a few Spanish words, that food was not so plenty here as he had fancied. The rains, which had fallen to the eastward of the gulf, had not favored the western shore, and for over two years the always arid country had suffered from a complete drought. The mesal plants which formed the Indians' chief sustenance, had failed to mature in sufficient numbers to support them, and they had eked out a living with mussels from the beach. They were even now planning another trip gulfward, and Estrada, hearing this, decided to stay with this band at least for that trip.

Nevertheless, though there was little preparation to be made, several days were passed in this spot and in similar camps in the neighborhood before setting out for the sea, and two more Cocopahs had by that time joined the party. The provisions of the Spaniards were getting low, and Bejar and Martinez got two of the Indians to go with them after deer. A few deer were seen, most of which were very shy, and Bejar, who was a poor marksman and used his match-lock rather hastily, missed several shots before he finally got a deer. The guns were indeed heavy pieces, old enough to have seen service at Pavia, and not easy to handle, so that misses were very common. The report of the gun was at first terrifying to the guides, but they afterward looked on the firing rather as a magic ceremony, which had to be repeated a number of times before the charm would work.

The deer was sorely needed for food, though on this day the natives by careful search had succeeded in getting a few mesal plants, which were said to be the last that were fit to eat. These were roasted in a hole in which a fire was made, and stones heated, the entire mass being covered up with sand when the flames died down and left until morning. Martinez said that he and his friends tried this dish, which tasted almost as sweet as sugar cane, but was so filled with sand by the method of cooking that they feared for their teeth, and would not eat it again. They did, however, find among the broken mussel shells which lay around the old roasting holes a few small pearls, discolored by heat, and were straightway very eager to start at once for the shore. Estrada, like many a recent prospector, may well have had enticing dreams. He may have fancied that he was now in the very Golconda, the mother land of precious jewels. Did not the viceroy say that the Indies of Portugal touched this country on the northwest? Why should not an enterprising leader win provinces for Spain and honors for his own hand? Perhaps he saw himself gradually mounting the ladder of nobility: Count Adelantado, viceroy, grandee of Spain! And Father Jayme shared the general enthusiasm. He no doubt dreamed of new regions subject to the cross like that City of Goa in the Orient to which Saint Francis Xavier was sailing this very year. The good man may even have seen in his vision a lofty cathedral raised to cover the bones of a blessed martyr, canonized as Saint Jayme by a grateful church.

But Juan did not take much interest either in the pearls or in the journey. He communicated to Martinez and the priest the fact that the oldest of the Cocopahs had a wizard's powers and had said that a man must be sacrificed to the water spirit to bring rain, that their mesal thickets might flourish again. In some way Juan had come to think that he was looked upon by his tribesmen as the destined victim, and by reason of this belief he kept close to the Spaniards most of the time.

The party started betimes on their march for the coast, distant some four days' travel. The Spaniards were now all afoot. One horse had died from the effect of an ar-

row wound, and the other three, which were by this time mere skin and bones, were too weak to carry riders, and could get no pasture at all further on, so they were turned loose to find what green thing they could among the stones. The first two days' travel was toward the south. Then the direction changed eastwardly, and on the afternoon of the third day's march a faint smell of smoke was noticed. The Indians, after indicating that water lay a short distance ahead, branched off in the direction from which the wind was blowing, and could soon be seen well up on a stony hill crawling with the utmost precaution either to surprise some enemy or to escape unseen if the other people were too strong.

The Spaniards kept on down the ravine they were following, and came to a scanty pool in the bottom shortly before sunset. Some hours later the Indians joined them, bringing in a prisoner bound with cord ingeniously made of mescal leaves, who proved to be the sole fruit of their recent raid. It seemed that a party of three men had made a fire to cook some mesquites and that, while two of these had seen the Cocopahs and escaped unhurt, the third one, who lay asleep, had not been awakened by his companions and had fallen into his enemies' hands. He belonged to the tribe of the Quiliú, who were always at enmity with the Cocopahs, and he regarded his captors with a sullen indifference as far from hope as from fear. This prisoner was driven along all the next day, no other incident occurring worth mention, except that Bejar again missed several shots at a deer, and about evening a spot was reached near the mouth of a dry valley that opened on the beach. Just beyond could be seen a small mesquite tree, the only green thing visible for miles. By scraping a hole in the sand at the bottom of the valley, water could be collected, slowly oozing from below. Hardship, however, seemed doubtless a slight thing to men excited by the hope of wealth and honors, and perhaps even after their long march the Spaniards did not sleep soundly that night.

A consultation was held next day. Estrada, Bejar and Martinez desired to explore as much of the coast as possible, discover its resources in food and water and gather such pearls as they could during the scout. The Indians had now enough water for the present, and a supply of food lay near that would last for several days at least. They refused, therefore, to move, and Father Jayme, hoping to soften their hard natures, decided to stay with the natives until his companions returned, as they would have to do in any case, if they did not find a practicable country beyond.

Estrada and his friends then set off southward along the shore. Very desolate mountains hemmed them in on the west, but they found mussel and oyster beds in great numbers, often reaching above low water mark. For several days the adventurers, who had to live on brackish water collected in holes in the sand, gathered masses of shell fish, spread them in the sun, and when the mollusks died and the jaws of the shells opened they searched for pearls, gathering indeed several hundred small ones and a few of the size of a pea, which were afterward sent to Spain by the viceroy with his report of the expedition. Meanwhile a great event had occurred at the upper camp. The water at the spring in the cañon had failed entirely. The Indians had gradually scraped away the stones and sand until the bed rock lay bare, but though the rock itself was moist not a cupful of water could be collected. The Cocopahs thereupon finally decided to sacrifice the Quiliú prisoner, and Juan told Father Jayme that the procedure would be to knock the Quiliú on the head with a stone club. The Cocopahs would then eat his heart and liver, so as to inherit his courage, while the rest of the body would be a sacrifice to the big fish spirit, who lived beneath the sea, and swallowed so much water as not to leave enough for the dry season.

This logical intention was strengthened by a singular portent. Martinez relates that on the morning of the threatened sacrifice he and his companions saw a great serpent swimming northward in the gulf about 200 paces from the shore; that his head was of the bigness of a wine cask, with eyes near the size of a breast plate and long white teeth. The monster held his head a few feet above the surface, and clove the water fast, showing at different moments from six to nine great folds of his undulating body above the water and stretching along for a space of upward of thirty paces.

It is doubtful of course in the view of the naturalist whether any such creature has existed in historic times, and there may, in this instance, have been some delusion on the part of the observers.

It should, however, be remarked that the most reliable reports of the appearances of sea serpents have come from two places, one off the coast of Massachusetts and one in the Gulf of California, and that many cool and practiced observers have given an almost identical description of the creature seen. So that we can at least credit the honesty of the historian in this case, whether we think he saw some rare saurian (perhaps a survivor of a prehistoric species) or whether some commoner thing deceived him.

This same serpent, we are told, passed in full view of the lone mesquite about two hours afterward, and excited the Cocopahs greatly, confirming them in their plan of sacrifice to the now visible deity. In vain Father Jayme assured them that it was but a tool of the demon, and would fly from the cross. They understood his actions if not his words, but their minds were made up.

The monster had no sooner vanished to the northward than the Quiliú was thrown down and dragged to the lone tree, where lay a broad, flat stone. The priest sprang forward among the savages, who were howling with excitement, and forbade the sacrifice, doubly abominable both as a murder and as a worship of the fiend.

For a moment the Cocopahs fell back, but they again gathered and advanced with sullen determination, as Juan said, "to get water surest way." Now Father Jayme had been searching for springs with the others, and had of course looked closely around this lone mesquite standing at the mouth of the valley without finding what he sought, but at this moment he seemed inspired by a higher knowledge.

Perhaps the good man felt the broad stone on which he was standing yield and sway under his feet; perhaps he saw a little moisture around the edges or perhaps

he simply took the last chance he had to turn the Indians from an impious purpose. "The Lord will provide," he shouted, still interposing between the executioners and the victim, and summoning Juan to his side he rolled away the bound captive, and with the boy's help stood heaving at the broad stone to turn it over.

While the Cocopahs gazed the stone was lifted a little and slipped back with a thud that forced out some damp sand at its side. Another strong effort by the two, and the rock rose, balanced on its lower rim and toppled over, while from the bottom of the hole, where it had lain, a little stream bubbled up, filled the basin, swelled over the brim and trickled down the beach. Father Jayme, meantime panting with exertion and excitement, stayed on his knees, fervently repeating the Psalm "Te deum laudamus te dominum confitemur." And to-day still, on the beach at San Felipe stands a lone mesquite, probably the same tree that grew there more than three centuries ago, and in its shade still wells up a spring of sweet water that tumbles down the sandy slope to mingle with the briny surges of the gulf.

This seeming miracle satisfied even the dull Cocopahs that the priest possessed mysterious powers. The Quiliú was neglected, and Father Jayme straightway undid his bonds and set to work to prepare him by conversion for baptism. The stolid Indian accepted the advances of the missionary with the same stolid composure that he had faced imminent death. He watched the priest's gestures closely, and even kissed the wooden cross when it was offered to his lips, imitating in this the action of the father. This therefore seemed a propitious moment to complete his entrance to the church, and Father Jayme performed the rite of baptism with all the ceremony his scanty fittings would allow. He also tried to induce the Cocopahs to be baptized at this time, but the boy Juan was the only one of the tribe who consented, and the father might well have felt a temporary regret that the armed force at his disposal was too small to make the baptism compulsory.

That night was a contented time. With enough to eat and a supply of fresh water the natives had lost much of their bad humor, and all slept well except perhaps the Quiliú, who, in spite of his recent admission to the church, took the first occasion to exercise his new found liberty, and was far away when morning broke. The priest grieved over this backslider, and the Indians seemed rather apprehensive lest the former prisoner should gather his tribesmen and attack the party with superior numbers.

Anxieties, however, were soon pushed aside by the return of Estrada and his two companions with their little bags of pearls. Of course the explorers were greatly elated by finding this earnest, as they thought it, of a great treasure, yet the state of things was quite embarrassing at the best.

The country to the south had proved to be as desolate and waterless as any they had yet passed through, except the region of the ink pot. Shell fish could be found along the beach, but no other food could be got. It was tempting Providence to try to scale the dry and barren mountains without a guide, and Estrada reluctantly decided to go back by the tedious and toilsome path that he had come. A few days' rest would first be had, and then they would shape their course for the Tizon (Colorado) River and leave further discoveries and conquests for a later time. This was the plan; but it was destined to meet a speedy check. On the morning of the third day after the arrival of the pearl hunters, the whole party was preparing to move westward, when the boy Juan, who had started early, came running back.

He had seen Indians lurking among the rocks of the ravine, which was the only pass for a retreat inland from this point. "Quiliú," said Juan, and he held up both hands, opening and shutting his fingers five times, to indicate that his estimate of the enemy's force was fifty men. Estrada thought that, counting the Cocopahs, who were eight in number, and the four Spaniards, they might fight through even so, but the Cocopahs, who seemed to possess a singular mixture of ferocity and cowardice, were not in fighting mood. They crouched behind rocks and made themselves as small as possible, even while no enemy was in sight. Father Jayme, greatly shocked by the local influence of the demon who had so depraved the mind of his late convert, advised that the party wait until night.

The Cocopahs would then hardly dare to be left alone, and the missiles of the Quiliú would fly harmless in the darkness. This course was full of danger, but it gave them a chance to get a good start, as they had never yet found any Indian keeping night watch, and besides the enemy might have to withdraw, either wholly or a part at a time, to get water, so this plan was adopted. But the Quiliú, on their side, had no idea of waiting until night. Several sneaking skirmishers were soon seen dodging from rock to rock, and it was not long before an arrow was fired from the mountain, which fell short of the Spaniards, but scared the Cocopahs so that they all, except Juan, who had good reason to distrust his kinsmen, dodged off up the coast as fast and as secretly as they were able. And now the prospects of the Spaniards seemed very unfavorable. More skirmishers crept up over the shoulder of the ravine. More arrows were discharged, some falling quite close. Martinez and Bejar fired a few shots with their match-locks, but they wished to save their ammunition for close and sure work. Bejar's bad marksmanship had probably been reported by the recreant Quiliú to his tribesmen, and they did not show so much fear of the firearms as Estrada had hoped.

Still the Quiliú advanced, skipping actively from shelter to shelter, when Father Jayme spied his late convert among the assailants.

Filled with holy indignation, the priest shouted warnings to the prisoner he had befriended. "Nec velocim est cursus nec fortium bellum." The race is not to the swift nor the battle to the strong, he cried. "Beware of just retribution." Saying this he pointed out the wretch to Martinez and Bejar, who alone had guns, and they took careful aim at the exposed part of the Indian's body and fired almost together. Whether the shots took effect or not they could not see at once, and almost immediately their attention was called away by a heavy jar, which seemed like thunder, though the sparkling sky had not a cloud stain on it. Father Jayme hailed this

"fulmen e sereno," as he called it, this bolt from the blue, as a good omen. But Estrada, with a soldier's eye, caught sight of a dim smoke rising over the rocky back of the cape close to them on the south, and knew the sound for the cannon of their deliverers. In a moment more the blunt prow and bellying sails of a caravel appeared around the headland, and hardly ten minutes had passed before the ship luffed, the sails slackened and spilled the wind, the boats dropped from the davits, and while the broad standard of Spain floated from the banner staff on the vessel's stern, the oarsmen of Alarcon pulled fast to the rescue.

It is not necessary to tell how this gallant seaman had set out to find the little band of Diaz, whose long absence had aroused anxiety, nor how he was on his way to the great river when he heard the shots and fired his signal.

We will leave the happy explorers and their boy Juan. We will leave the joyous and grateful priest on the beach proclaiming with uplifted arms, "Non nobis sed nomini tuo sit gloria." Not unto us, oh, Lord! but unto thy name be the praise, while the bright muskets and the glittering breast-plates of the deliverers draw near. But we will call attention to the fact that the first white discoverers who set foot in California lost not a man save their beloved captain, and slew not an Indian save in self-defense.

Natural History.

About our Bluebirds.

ORNITHOLOGISTS state that the bluebird is an insectivorous bird, which signifies that this species of birds subsists chiefly on insects. The peculiar form of the bill of a bluebird indicates that its principal food consists of insects in the larval or worm state. Ornithologists tell us also that the bill of a sparrow indicates, by a different form from the bluebird's bill, that the irrepressible sparrow is not an insectivorous bird.

The male bluebird is a sweet and charming singer of a little song which a person of lively imagination can readily interpret into: "Be no more winter." Bluebirds always appear in pairs—male and female, husband and wife. In the latitude of New Jersey and New York bluebirds have always been accustomed to appear in the former part of vernal seedtime. An ornithologist who was a resident of Newark, N. J., stated more than twenty years ago that bluebirds always appeared in the latitude of New York city on Feb. 22 of every year. In autumn they all go to some southern clime, to escape the cold of our northern winters. We can only conjecture where they go. No ornithologist has ever been able to follow them to their congenial region, far away from the piercing cold and snow. But they always return to their former homes, and repair their old nests, lay their eggs, hatch and rear their young ones, unless some reckless shooter thoughtlessly and cruelly pops over the charming songster. Bluebirds build their nests in holes and hollow places that have been pecked in the bodies of trees, like the holes where woodpeckers build their nests. Or they will build a nest in a small box provided with an auger-hole of sufficient size to allow them to enter and make a nest.

Many years ago, when I resided in central New York, the home of my early life, a pair of bluebirds built a nest in the open top of the penstock of our pump, in the barnyard, where we watered our domestic animals. It was a cozy and secure place for them. No cat nor other nocturnal marauder could disturb or harm the eggs or birds. Every spring, some time in March, that cheerful and happy pair of songsters would return and repair their old nest, and lay four or five beautiful little eggs, and hatch and rear their young birds. We knew that they were the same birds every spring, as they looked and acted precisely as the pair did that had been accustomed for several years to occupy that place. They were so gentle that the mother bird would not fly off the nest when we came to the pump to draw water. We could look right down in the top end of the penstock about a foot, and there see the little nest and the cunning little eggs, when the mamma bird was not on. When she was on the nest she would look up to us with an inquiring and impressive gaze, silently appealing to us not to molest nor hurt her or her little family. Many times every day, like a true and faithful consort, the male bird would come to their secure retreat and bring in his bill a fat worm, which he would deliver to her. Then all day long he would keep a watchful eye on the movements of crows or hawks or other robbers of birds' nests; and when he saw any animal which he thought was an enemy he would utter such an alarming outcry that some one would hear him and go immediately to see what hostile foe was about to molest the happy family. Crows, hawks, cats and rats all like to feast on young birds of any kind. But bluebirds are endowed with so much of the instinct of caution and self-preservation that they build their nests in such secure places that very few of their enemies can devour their eggs or reach the young birds.

After the little, tender things have burst the shells the careful mother takes every fragment of a shell in her bill and carries it many yards away from the nest, instead of allowing the shells to remain in the nest, or instead of heaving them out on the ground directly below the nest. All birds possess this instinct of cleanliness and caution. Crows and hawks, instead of simply throwing the broken shells of their eggs, after hatching to the ground, carry them, often, hundreds of yards from the nest. Instinct teaches them that if they heave the shell out of the nest and allow the fragments to fall to the ground directly below the nest some enemy would see the shells and find the nest, and then destroy the eggs or the little birds.

It is really wonderful and amazing to consider the intelligence, the carefulness and parental caution exercised by bluebirds in feeding the little, tender fledglings before their tiny eyes are open, and before the helpless bundles of life have enough strength to keep their bodies right side up in the nest. We look down into the little nest and see the careful mother bird bite off a very small piece of a fat and tender worm, and hold it in her bill, and then touch the bill of one little baby bird, when,

by instinct, the little thing opens its mouth and the mother drops the tidbit in the young bird's mouth. In this way she feeds every tender fledgeling. Instinct teaches the mother not to drop in the mouth of a bird an atom of any food that is not soft and delicate and easy of digestion.

The mother is always the queen, the manager, the superintendent, the director and absolute controller of all the operations incident to selecting a place for their nest, building the nest, choosing the better time in all the year for laying her eggs and rearing the little family. The male is always a subordinate equal.

When our bluebirds returned one season, in early springtime, to the pump which had been their little home for many years, and found that their house had been removed, and not a trace of it could be seen, they both lingered about the place for several days; and when any one went to the well to draw water with the new apparatus the dear birds would come and light on the curb and look anxiously into every nook and angle for their old nest. I took a part of an old, half-decayed fence rail, in which woodpeckers at some former time had bored in, and excavated a place for their nest in the soft wood, and placed it on one end under an apple tree a few yards from the pump. Then I clapped my hands together and adjusted my thumbs so that by blowing in the opening between the palms of my hand I could make the welkin ring by the shrill sound of that extemporized whistle. Quicker than I can rehearse the fact the female bird came from a distant part of the orchard, flying swiftly to me and lighting almost within my reach. I talked to the anxious warbler and told her that there in that old rail was a nice and cozy home for her. I have no idea that she understood my language; but I continued to remain a few yards from the old rail, to see if the birds would not discover that hole and build their nest in the old home of a pair of woodpeckers. Very soon the mother bird spied the hole in the old rail and flew quickly to it and peered in, and then went in and came out, and then went in again and came out, and gazed inquiringly all around in the tree top, and cast many glances at me, as if inquiring if everything was all safe and right. "That is all right, birdie," said I. "Take full possession. No one shall disturb you if you make your nest there." The bird looked at me, turning her head this way and that way, in the attitude of an anxious inquirer. I repeated again: "That is all right, dear birdie." Quick as thought she flew to the top of the tree, and in a shrill tone of voice, which could be heard hundreds of yards away, she called: "See here! see here! see here!" as plain as could be to my interpretation of bird language. In less than half a minute the mate came flying swiftly from somewhere (I didn't know where), whereupon she flew to the hole in the old rail and went in and out. Then I heard her utter a low note, which the male seemed to understand, as he went quickly to the hole and entered in and came out. Then she went in and out and bade him go in again. Then they rubbed their bills together and both flew away out of sight.

"Well!" I exclaimed, "that is the best I can do for you." But to my surprise, in only a few minutes the female bird returned with a mouthful of wool, which she took into the hole in the rail. After a few minutes longer the male returned with a mouthful of fine horse-hair, which he delivered to his mate. After the lapse of two or three days their little nest was finished, the interior being covered with down and soft lamb's wool. Then, after the lapse of a week or two, there were five pretty eggs, from which five charming songsters were hatched and reared.

When I moved to New Jersey and built a suburban villa, holes were bored in the hollow corner posts of the railing on the summit of the tower, more than 50 ft. from the ground. Bluebirds built their nests in those hollow posts and reared their young birds, until cruel shooters had popped over the last songster of this species of birds. Bluebirds and all other insectivorous birds always manage by instinct to lay their eggs and hatch their young birds exactly at the period of vernal seed-time, when there is a generous supply of tender worms. The goose always makes calculations to build her nest, lay a setting of eggs and hatch her goslings at that season of the year when

"The grass comes creeping, creeping, everywhere,
On the sunny hillside, in the cozy nook,
In the fields and on the lawns,
And by the babbling brook."

The bluebird, the Baltimore oriole, the bobolink, the meadow lark, "little chippie" and many other birds were all insectivorous birds. They are immensely valuable in fruit orchards, as they devour untold numbers of insects which are very damaging to growing apples and other fruit. Seventy years ago wormy apples and pears were extremely scarce, for the simple reason that the birds devoured such immense numbers of the worms. But at the present time we are amazed to notice how few apples are free from worm holes. If the singing birds could only be restored, their services by way of destroying noxious insects would be of immense value.

ORANGE, N. J.

SERENO E. TODD.

A Drumming Grouse.

WHILE in the woods of northern Michigan last summer I had the rare experience of witnessing a ruffed grouse drumming.

So often have I heard people, even sportsmen, advance the theory that the drumming sound is produced by the bird scraping or striking its wings against a hollow log or stump that I take the liberty of writing this piece, repeating what many must already know.

One afternoon, about the first of June, I was seated on a bluff overlooking Lake Superior, with a virgin forest behind me, when suddenly a grouse started to drum near me. He would drum and then wait a short time, and then drum again. He kept it up so long that I thought I might be able to crawl along the ground, and so get a view of him. Getting down on my hands and knees, and taking care not to break any sticks or shake the underbrush, I crept toward the sound, only moving forward when the drumming was going on. After crawling in that manner for a short distance I happened to look up, and there was a large cock, standing

on a log, not more than 20 ft. away. He saw me about the same time, but didn't seem to be scared, for after a pause, a little longer than usual, he continued his drumming. He would throw out his breast and puff himself up, and then raising and throwing forward his wings, would beat his sides and breast, slowly at first, and increasing the frequency of the strokes until they ended in quick vibrations, making his wings almost invisible.

The first five or six strokes were about a second apart, and he would increase the strokes steadily from that on until almost the end. After drumming he would spread his tail, and craning his neck would look all around, and then remain perfectly still and listen for about five minutes, then repeat the drumming and again remain still and listen. While I was watching him he went through the performance six or eight times, and then jumped down from the log and walked away. After he had gone I went up and inspected the log. It had evidently been selected as a general place for drumming, as there were feathers and other signs around and on the log. The log was 3 to 4 ft. in diameter and partially decayed, and gave out a hollow sound when struck. No doubt the log is used as a sounding-board.

I waited for some time, but he didn't come back, so I returned to the club, where I was visiting.

FRANK SEMPLE, JR.

The Care of Marmosets.

IN his "Rois en Exile" Daudet says that the King, when bored by his mistress, sent her "the most beautiful little creature imaginable," a marmoset, to signify that he wished to be rid of her.

This substitution of monkey for man seems to me an evidence of consideration on the part of His Majesty, for the woman who knows the companionship of a marmoset can well do without royal regard.

These phantasmal little creatures, tender and timid, affectionate and intelligent, are perhaps of all the smaller pets the most satisfactory. Knowing the marmoset as I do, it is a matter of pain and surprise to me to find that but comparatively few persons know how to give to them the intelligent care which would insure the health and comfort of their pets.

I have seen many a marmoset die an agonizing and unnecessary death simply because they had been fed by their owners on bread and milk, whereas in reality Paris green would give a more humane death than the lingering one caused by the artificial diet of bread and milk, crackers, candy and cake. Civilization has many sins to answer for in regard to these unfortunate simian sufferers. The marmoset is essentially insectivorous. He must have bugs or die, and with the bugs as a steady dietetic stand-by must go bananas, and of inestimable importance in the hygiene of these beings of film-like tissues and membranes—tapioca. I cannot lay too much stress on the nutritive virtues of tapioca, boiled in sweetened water and given freely to all kinds of monkeys, from the atomic marmoset up to the gigantic gorilla. They all love it, and grow sleek and fat on it. Eggs, both raw and hard-boiled, are capital, and in summer grasshoppers, crickets, moths, millers, June bugs, and in short every kind of bug except our own native croton bug and cockroach. These two are deadly. In winter, and in fact all the year round, the bug problem is solved by the wholesome and succulent meal worm. These may be bought of any dealer in birds, or better still, keep in your cellar a box of prepared meal and bran, wherein can be bred myriads of worms. Onion juice mixed with sugar may be given two or three times a week to the marmoset with beneficial results. In addition to the articles of diet I have mentioned may, or must, be given all varieties of fruit and uncooked vegetables, notably corn and tomatoes, soft-shell almonds and popcorn.

Sleep is an important factor to these beings of an acute vitality. Twelve hours they must have, and sixteen hours will insure to them a hale old age, free from nerves and tremors. A basket and a blanket of eider-down flannel are all that they ask, and thus equipped they sleep like dormice.

I cannot think without pain of a caged marmoset. They must leap and climb and jump, or soon the spinal cord becomes affected and paralysis sets in.

The climate in summer, if the animals are fed properly, is not too severe for them. From May till October mine have the freedom of the town, sharing the trees with the birds and the fences with the cats. More monkeys die from bread than cold. A crumb of bread is more to be feared than a ton of climate.

A marmoset in health never drinks water. Thirst is a sign of fever in the stomach. This is also the case with the larger monkeys. Fed properly, they never want water, and when they do they need a doctor.

It is my conviction, based on many years of observation, that when bread and milk are banished from the cages of the monkeys in our public zoos and menageries we will put to flight pneumonia, diarrhoea and all the troubles attendant upon an erroneous dietetic system. It has been my sorrow to see many of these unfortunate creatures suffer and die before I knew how either to cure or to prevent disease. Their evangel came in the form of my own marmoset Dulce. All that I know of his race he taught me. Dulce is now in his sixth year, and is as strong as a Shetland pony. It is with me a distinct mission to spread the gospel of Dulce.

NEW HAVEN, Conn.

JUSTINE INGERSOLL.

Iowa Wolves.

BERKELEY, Ia., April 20.—*Editor Forest and Stream:* On Monday last a farmer residing here captured five young wolves. They were taken in an open meadow, where the old wolf was evidently moving them to a better place of concealment. He succeeded in getting a shot at one of the parents, but at too great a distance to be effective. Last year at a little later date five young ones were taken from an old straw stack in the same vicinity. The former litter showed unmistakable signs of hybridism, some of them being marked with a white spot on the neck and head, and one with a few white hairs on the tip of his tail, somewhat resembling a shepherd dog; otherwise they were true to the species in form and color.

E. D. CARTER.

Game Bag and Gun.

CHICAGO AND THE WEST.

Ducks.

CHICAGO, April 21.—There seems a decided tendency of sentiment in the States of Minnesota and Wisconsin against the practice of spring shooting. The agitation is distinct in many circles, and the increase of sentiment against the spring killing of migratory fowl will in all probability before long be recognized in the passage of sweeping laws prohibiting such shooting. From Minnesota the reports come that the season has been unusually good so far as the shooting possibilities were concerned. More ducks were killed this spring in Minnesota than for some time past. Not long ago this would have been considered simply a matter for self-congratulation, but this season there has been an awakening, and many shooters are beginning to speculate what would have been the result if these birds had been allowed to breed. A distinct movement is under way in Minnesota, and representatives who go into the next Legislature will be sounded as to their views on spring shooting by a large and increasing contingent of constituents.

The Minnesota season closed last Friday, but Wisconsin allows shooting until May 1 on the deep-water ducks. This is another instance of the loophole in the law, and of course it means that all sorts of ducks are killed by a great number of persons. Mr. George A. Morrison, of Fox Lake, Wis., writes me as follows in regard to the abundance of fowl in his part of the world:

"We have had the best spring shooting here this season that we have known for years. Big bags were killed here the last two weeks, mostly of blue-bills, and a few good strings of redheads. The ducks have not been chased up and down the lakes from morning till night as heretofore, and so have had a chance to rest. However, I hope this will be the last of spring shooting in our State. If the laws continue as they are at present, we will in a few years have no shooting at all, either spring or fall. There seems to be a sentiment growing among the local shooters in favor of a close spring season."

Yet another Wisconsin gentleman, Mr. W. E. Warren—and curiously enough, a resident of the same section as the writer last above quoted—adds his testimony regarding the spring flight of '98. Under date of April 20 he writes me as below, from Fox Lake, Wis.:

"The slaughter of ducks is on here at Fox Lake, and I guess last week broke all records. Fred Merrill, of Milwaukee, got 105 in one day, and others report nearly as many. One of the market shooters of Milwaukee took in over 200 as 'baggage.' I suppose some of the market shooters, even, are now advocating the stopping of spring shooting. I sincerely hope we will get such a law soon, before it is everlastingly too late."

In Illinois the flight was kissed good-by in the upper county of the State last week. Mr. Ernest McGaffey, of this city, shot for a couple of days at Long Lake, just below Fox Lake, Ill., and killed a couple of dozen ducks, 17 in one day. Along the Fox River Messrs. V. S. Lumbly and C. P. Barnes killed 97 ducks in one day week before last, bagging 43 birds in one hour and fifty minutes. These gentlemen live at Woodstock, Ill. In the lower part of the State the shooting practically ceased the week before the close of the season.

Snipe.

The snipe season has been on the whole very satisfactory thus far. There is a large territory in Indiana and Illinois suitable for feeding grounds, and the consequence has been that we hear of a greater number of small bags and not so many of very large bags. I have as yet not heard of over 30 birds to any one gun this spring, but a great many reports come in of bags of a dozen to two dozen.

Near Freeport the shooting was last week very good, and a number of fair bags came in. Around Fox Lake, Ill., there has been some good shooting, but not of extraordinary interest. On the Sag, just west of this city, a few shooters have managed to connect with the flight, and have had heavy shooting, though others who have gone to that capricious vicinity have not been so fortunate. All around the southern edge of Chicago, there has been a lot of good snipe country, and very good bags of jack snipe have been made practically within the city limits. Charlie Antoine and a friend one day this week picked up 30 jacks while driving around from place to place at the southern edge of the city. Oswald von Lengerke, Mr. Antoine's business partner, with Mr. Shaw, of the same house, made a second trip to Koutts last week, but got only 27 birds.

At Maksawba Club, on the Kankakee, is one of the best snipe marshes in Indiana, and a great many birds have been killed there this spring. Mr. W. P. Mussey went down last week and in three days bagged over 60 birds. John Matter at the same place bagged 38 birds in two days. On one day several of the club members went out, with the following success: W. H. Haskell 22, Mr. Irwin 24, R. B. Organ 23, W. P. Mussey 26, M. Petrie 7, W. Gillett 8. These birds were on the marsh about three or four miles from the club house.

The snipe are now fat and in good condition, and the shooting becomes easier every day. John Watson went down to the marsh again day before yesterday, and he will in all probability be good for two or three dozen snipe a day. All the country is now getting green and the grass is coming up nicely on the marsh, while the receding water is making drier and more wormful large strips of the fat black soil of Indiana.

News from Montana.

Mr. John D. Losekamp, of Billings, Mont., is spending a few weeks in Chicago this spring purchasing goods for his Montana outfitting store. It breeds a vast discontent with city life to hear Mr. Losekamp talk about the Montana country. He reports Old Bill Hamilton, Liver-eating Johnson and other Montana friends as still well and prosperous, and says also that the mountain trout of the streams near Billings, notably of the famous

Boulder Creek, are bigger and sassier than ever before. I have earlier spoken of Mr. Losekamp's efforts in planting the Mongolian pheasant in his country. He tells me that he has the most sanguine hopes of the success of his experiment, and has no reason to regret the expenditure of hundreds of dollars which he has put into this work. He is using, not the ring-necked pheasant, but the uncrossed bird known as the Denney pheasant, which he obtained at considerable trouble from Oregon. He has these birds scattered out over the country among the ranches of his section, and he thinks they are doing well. He says they are the gamiest birds he has ever met, and speaks of their qualities with the most unqualified enthusiasm. One of the cocks was found with a broken leg, but was ready to fight even on that basis. A doctor set the leg and the old fellow is now going round as good as new on the patched leg, and ready to fight anything that moves. Mr. Losekamp says that one of these birds will whip a bullet hawk so quick that the latter will not know how it happened. He thinks that the Yellowstone Valley, with its great area of grain crops, will eventually be a feeding ground for many thousands of these valuable birds.

Mr. Losekamp is one of those practical, executive men of whom the world has but too few. He is a business man and knows that you cannot always sell goods unless you purchase stock. Besides his experiment with the pheasants he is now doing what he can to get the Fish Commission at Bozeman to stock the beautiful sheet of water known as Bear Tooth Lake with trout. This is a grand sheet of water, with many fine tributaries, but being above the falls of the Clark's Fork, is barren of trout. As the fry can be taken to these waters in less than sixteen miles from the railroad, and as the Billings men offered to pay all the expense, it is hoped that the Fish Commission will grant the above request. Dr. Henshall is an angler himself, and has not been at Bozeman for nothing, I imagine; so as an angler I hope he will see what he can do toward thus increasing the mileage of mountain trout waters in the grand State of Montana, where there is such angling as Eastern men never knew.

So far very well in the news from Montana, but Mr. Losekamp has a report of a much sadder sort. It may not be generally known, and it was indeed not wished to be generally known, that for some ten years the ranchers of Montana have been trying to preserve a little band of buffalo which ranged in Fergus, Custer, Choteau and Dawson counties. At the time I was in Montana in 1895 this herd was reported to have eight head in all, and two or three animals were killed that year and the year previous. Mr. Losekamp tells me that the little bunch gradually increased, under the watchful care of the cowboys, until there were twenty head two years ago. The cowboys would round up these buffalo each year, and they had made a practice of branding such as they could rope from time to time. The "79" outfit had their brand on thirteen head, and branded five buffalo calves in one year. The Montana ranchmen had great hopes of this little herd, which was the largest left outside the Park, and which ranged in a country little visited and difficult of access. All their hopes came to an end season before last, when a wandering band of Cree Indians came in from the North and cleaned up the entire herd. Since then not a head of the lot has ever been seen, and it is thought that not one is left alive.

Mr. Losekamp is accompanied in town by Mr. Warren Evans, of Crow Agency, Mont., who is East on a visit. I should not forget to add that both gentlemen speak in terms of the highest praise of a new fountain of youth, the springs of the Stinking Water, south of Billings, on the stream of that name. Here with several friends Mr. Losekamp spent some weeks last season, trout fishing, having all the wild game they wanted all about them, with fine angling and the best waters on earth. Methinks that neither White Sulphur of old, nor Saratoga of later years, ever offered such a programme as this of the little known Montana healing springs!

The Tree and the Bird.

If there were no trees and no birds, we might think that this old world was a pretty poor place to live in. The doctrine of more trees and more birds is a safe one and well worth promulgation. At least so thinks Gov. Schofield, of Wisconsin, who has issued proclamation setting apart Friday, April 29, as Arbor and Bird Day for that great State.

E. HOUGH.

1206 BOYCE BUILDING, Chicago.

About Maine Moose.

Editor Forest and Stream:

IN FOREST AND STREAM of April 23 there appeared a very suggestive article signed M. H. Who can wonder, after the perusal of that article, that one of the noblest animals on this continent has been well nigh exterminated, and that the most skillful of hunters may now hunt for days or weeks in the territory mentioned by M. H. without getting a shot? His hero, Hiram Leonard, it appears, had killed four moose in two days, but that only served to arouse his lust for blood; so he and M. H. go out and kill another. That night they shot the sixth, and four days later Mr. Leonard demonstrated his propensities by putting lead into still another. His biographer then goes on to state that two years later, after Mr. Leonard had already killed five moose in less than two and a half days, he started out to indulge in further carnage, and killed eight more, making for himself the unenviable record of slaughtering thirteen moose in less than fourteen days! to say nothing of the probability of having wounded several others during that time.

As Mr. Leonard was a rod maker, and presumably went into the woods as a sportsman, he could not even plead the excuse made by the market hunter. He goes further and sneers at the man who kills but one moose, and ventures to relate the circumstances in FOREST AND STREAM, as though the story of killing one moose in a sportsmanlike manner were not more entertaining and agreeable than the nauseating and gory picture portrayed by M. H. "Maine men used to know how to hunt, but they did not do it with the pen," says M. H., and yet he has demonstrated with his own pen that at that day some Maine moose hunters did not know how to hunt

as sportsmen, but wantonly destroyed game they had no use for, and did their full share toward robbing the present generation of its heritage.

It is true that at the time of which he writes the game laws were not in effect in Maine, but there were laws of humanity and sportsmanship in force then, as at all times, and as now. Thank God, the time has gone by when men can safely turn a forest camp into an abattoir, and the time has come when even the recital of such things as M. H. writes about cannot pass unnoticed or uncondemned. The day is at hand when through wise legislation, and better still, a generous spirit of true sportsmanship, the game will be protected and allowed to increase, until the fields, woods and waters will be again tenanted by the birds, animals and fishes which folly and selfishness have well nigh exterminated. Then the game hog will suffer such penalties, both legal and social, as he deserves.

ARTHUR F. RICE.

The Old Gun.

Editor Forest and Stream:

Under the head of "Ready, Aim, Fire," you vividly depict the charms of the modern gun.

Compared with the arm of a generation ago, it is indeed a wonderful weapon and a source of pleasure to the possessor; but it has its disadvantages, the chief of which is the ephemeral character of its charms. In the time of the muzzleloader a man kept a good gun during his lifetime, and bequeathed it to his favorite son or grandson. It was as well known among his friends as himself. Its "voice" was recognized at a distance as readily as that of its owner.

It's different in this era of invention and improvements. We have to change guns every four or five years or shoot a "back number."

When the breechloading shotgun appeared we fought against it and disparaged its shooting qualities faithfully as long as we could, but had to fall in line and try to keep up with the procession. Soon improvements were made necessitating another change. Still other improvements followed until the climax, as we supposed, was reached in the hammerless gun and smokeless powder. But no; if we want to be up to date we must have an ejector, and now comes the single-trigger gun trying to seduce us from our allegiance to our latest, which we have owned just long enough to get well acquainted with, and which we already love next to our wife—or our dog.

It's wicked, this breaking up of family ties, this parting of man and gun; but what are we to do? We don't want to be classed with Rip Van Winkle. We must keep up with the times and have a gun that is up to date, even if we must, as Mr. Hough says, forego the pleasure of feeding and clothing our families.

The factory-loaded ammunition also, loaded in an unimaginative and matter-of-fact machine, takes away the individual characteristics of our gun, as well as dispels the fond illusion that our own particular gun, loaded as we alone know how to load it, excels all others in killing power.

I am free to confess, however, that these thoughts become more prominent with us old sixteen-to-one sportsmen (sixteen silver threads to one of the original color) when in a reminiscent mood, with chair tilted back and feet on the table, than in the field with dog and gun, or when at the trap smashing the elusive bluerock (or trying to).

I don't see any one going back to the muzzleloader and G. D. caps, though the old fellows hate to break the "ties that bind" to the old gun.

Mc.

Logging Head Works.

I SEE that your printer has changed what I intended to read as "head works" into "breastworks." As a state of war does not exist in the Maine woods, we seldom see breastworks when hunting; but we could not possibly drive our logs without "head works." A head work is a large raft of logs or hewed timber, which has a capstan in its center. This capstan is provided with ten or twelve capstan bars, which are turned by as many men, or often by double crews. The head work is placed at the forward end of a boom of logs, a long warp is attached with a 900 to 1,000lb. anchor at the end. This anchor is boated ahead as far as the warp will reach, and then the boom is by means of the capstan wound up till the anchor is under foot; then another warp is attached, and another anchor boated ahead, and the first anchor is raised, to be in its turn placed ahead again. In this way all our logs are warped across our lakes, often 10 to 15 miles at a stretch, when the wind is ahead, except on those lakes where steamers have been placed for the purpose of towing.

Deer are coming out in abundance on the railroads. A conductor who lives near me counted twenty-seven in one week from his train.

M. H.

Pheasants in Rhode Island.

IF the residents in the vicinity of Warwick Neck happen to see a strange bird resembling in size and form the native partridge, but differing somewhat in color and plumage, they need not be surprised, for it is probably one of the Mongolian pheasants which have recently been liberated by the Warwick Neck Game Association. It is expected that these birds will propagate rapidly and stock the surrounding country, and be a valuable addition to the game supply. The result of the experiment of the Warwick Neck Game Association in introducing Mongolian pheasants into this State will be watched by all who are interested in birds, and it is confidently expected that it will prove successful and stimulate private enterprise in the same direction.—*Providence (R.I.) Press.*

Adirondack Deer.

A RECENT letter from my guide, C. L. Stanton, of Blue Mountain Lake, reports that the deer have wintered well in that section, and that the prospect is fine for a good game season.

Sea and River Fishing.

Fresh-Water Angling.

No. IV.—Black Bass.

BY FRED MATHER.

THE black bass is the gamiest of all fresh-water fish, taking it pound for pound. If a 25lb. salmon had as much fight in each one of his ounces as a black bass has he would be a terror and we would have to devise some new salmon tackle to hold his avoirdupois.

The black bass can be found in all fresh waters, from the cold Adirondack lakes, where brook trout live, to the warmest waters of Florida. Therefore the black bass is accessible to more anglers and is a more popular angling fish than any other that is caught in the fresh waters of America. It is a superior game fish to any that exists in Europe, if we except the trout.

Stick a pin here! Stop and think a moment. Trout worship came to us from the old world, and it is almost akin to heresy to whisper that any other fish could be as gamy as a trout. We received our angling beliefs as we did our language from England, and English angling literature was the only angling literature we knew until our own Norris wrote the first original American book on angling for American fishes. He was not an ichthyologist, and followed the teachers of his day. Here was a new fish not laid down in English angling works, and "Uncle Thad," in his great-hearted, kindly way, treated it gingerly; he knew it as a good game fish, but as he told me just before he died, he was not sure of his ground. As the first independent American writer on our native angling fishes, Thad. Norris ranks first. All others who wrote before him were not practical anglers for American fishes. Frank Forester's book on "Fish and Fishing" was merely a rehash of English works with some purloinings from De Kay's "Fishes of New York" to pad it out. To my great confusion, when I tried to identify fishes from his descriptions, especially

HELGRAMITE OR DOBSON,

or alligator, or angle dog, or bloomer, or bogart, or clipper, or cobbler, or crawler, or devil catcher, or dragon, or go devil, or goggle goy, or hell driver, or hojack, or klugmite, or stone crab, or stone devil, or water grampus, or —

the black basses, I had not then seen De Kay's work, and knew nothing of classification. Later Dr. Gill reduced the many so-called species of black bass to two easily defined ones, and then it was simple; we had only two scientific names to remember and two fishes to know—the big-mouth and small-mouth. Dr. Henshall upset the scientific names again when he examined the type specimens in Paris, and his nomenclature stands to-day.

The Two Species.

Although the species may be distinguished at a glance by most anglers, there are many who cannot tell which of the two they are catching. Nearly twenty years ago, before Henshall's revision of the names, I wrote some doggerel verses to explain the differences. With the alteration of a couple of lines to make them technically correct, they are:

The little-mouth has little scales,
There's red in his handsome eye;
The scales extend on his vertical fins,
And his forehead is round and high:

His forehead is full and high, my boys,
And he sleeps the winter through;
He likes the rocks in summer time,
Micropterus dolomieu.

The big-mouth has the biggest scales,
And a pit scooped in his head;
His mouth is cut beyond his eye,
In which is nary a red.

In his eye is nary a red, my boys,
But keen and well he sees;
He has a dark stripe on his side,
Micropterus salmoides.

These lines sum up the main differences. The size of the mouth is not determined by opening it, but by noting how far the bone of the upper jaw extends on the cheek. In the small-mouth it stops about the middle of the eye, while in the big-mouth it is prolonged beyond the eye. As I read the above lines after many years, there seems to be another benefit in putting the description in verse, and that is to rhyme "salmoides" with "sees," for I have heard men pronounce it in two syllables. It has four, for in all these Latin names every vowel is a syllable; therefore, my boy, call it sal-mo-i-dees, and you'll be right.

The Latin termination "oid," or "oides," means likeness, and while the fish has not the slightest resemblance to a salmon the name was given as a concession to its popular name of "trout," in the South, where the naturalist Lacépède found it.

Popular Names.

Without being particular as to which species is meant, for the popular names were bestowed before the species were clearly defined, we have "chub" in Virginia and on the Tar River of North Carolina; "Welshman" on the Neuse River, N. C.; "jumper" in Indiana; "trout" and "moss bass" in the Southern States. According to Goode it is also known as "pearch" in some parts of the South, while Jordan says that in Alabama it is known as "mountain trout." Goode also gives marsh bass, river bass, rock bass, slough bass, white bass, green bass, spotted bass, green perch, yellow perch, black perch and

LARGE-MOUTHED BLACK BASS (*Micropterus salmoides*).SMALL-MOUTHED BLACK BASS (*Micropterus dolomieu*).

YOUNG OF SMALL-MOUTHED BLACK BASS.

speckled hen as names applied to one or both species.

As railroads take anglers into all parts of the Union where fish are to be caught, these various local names will disappear, and the name of black bass for both species will take their places, because by that name the great body of anglers know them. Yet the fish are not black, nor anywhere near that color, but a name is a name, no matter how absurd. In parts of New York the provincial and non-progressive angler calls only one species "black bass" and the other he designates as "Oswego bass," and this to a fish which has a greater range than its congener and is found from Canada to Florida! But as I always get hot under the collar when a man talks of "Oswego bass," which the boatmen on Greenwood Lake—partly in New York and partly in New Jersey—who call themselves "guides," have corrupted into "Swago." "Guides," forsooth, where one could not get lost under any conditions.

Distribution and Habits.

The range of the two species is nearly identical. The big-mouth covers the most territory, ranging further north and south than its brother. Jordan gives its range as: "Dakota to New York, south to Florida and Mexico, everywhere abundant, preferring lakes, bayous and sluggish waters." The same authority limits the small-mouth to: "St. Lawrence River to Dakota, south to South Carolina, Alabama and Arkansas, preferring clear and running streams, hence less common South than the next species," meaning the big-mouth. My assertion that the b. m. ranges further north than Dakota rests on a statement made to me by an English angler whom I met while fishing in Louisiana some years ago, who was familiar with both species, and said that he had taken the b. m. in Lake Winnipeg, in Manitoba. If my informant was correct, then the b. m. should be found in Lake of the Woods and other waters flowing off to Hudson's Bay. I do not say that the fish is found in Manitoba, I tell it as 'twas told to me. * * * After this was written I took down Henshall's "More About the Black Bass," to see what he said, as he was not very definite about the range of species in his first work. He says, p. 41, "The geographical distribution of the black bass is remarkable for its extent; the original habitat of one or other of the two species ranging from Virginia to Florida and from Canada and the Red River of the North to Louisiana and east Mexico." As the Red River of the North flows into Lake Winnipeg, we may presume that the b. m. ranges as far as that system of waters does, until it meets the brine, for which the fish has no use.

The two species are often found in the same waters, if the waters be a lake of some size. They are taken side by side in many lakes, but the b. m. is not fond of swift, clear rivers.

There were no black bass in the Hudson River until the Erie Canal was built, some time in the 30s, and then they followed down and were locked through into the river. We boys occasionally caught one, but they did not seem to become plenty, and it is a singular fact that they only breed freely in the lower fresh waters of that river, say about Kingston, which is something like fifty miles below where the bass came in at Albany and Troy. Neither species of black bass is frequent enough

between the city of Hudson and the Troy dam, a distance of nearly forty miles, to entice an angler to fish for them. Apparently there are spawning grounds and waters suitable for both species, and there is food in plenty. The river is rich in eels and suckers, and unless these fish despoil the nests of the bass I cannot guess why they do not thrive between Hudson and Troy. The upper Hudson, from Troy to the rapids of North Creek, looks like good grazing and spawning for the s. m. bass, but they are not there in numbers. To a superficial observer, like myself, the contrast between the Hudson and the Potomac as bass streams is a puzzle. The conditions appear to be the same—but they must differ, somehow. It does not seem to be a difference of food nor temperature, and if not these conditions, what is it? The two species were not indigenous to the Potomac any more than they were to the Hudson. They were native to Carolinas, but not to waters further north on the Atlantic coast.

The habits of the two species are much the same; they feed on the same kinds of food, and only differ in the fact that the big-mouth will thrive at both colder and warmer temperatures than his brother, and will also live where the water is quite brackish, which the s. m. will not. The s. m. prefers the clearer and cooler water of the heads of Southern streams, while the other fellow seems indifferent to temperature. The black bass of Florida and eastern Mexico are all of the b. m. species, and grow to a weight of 16lbs. or more, while in the country north of Pennsylvania one of half that weight is a big one, no matter what may be the length of its jaw.

Black bass spawn when the waters warm up, in New York from about May 10 to the middle of June, and earlier or later north and south. The law of New York allows them to be caught on May 30, when perhaps half of them have spawned; but as the fish guard their nests and young for at least a week after spawning, the date is too early. All attempts to fix a later time for opening the season have failed. Anglers have held off about as long as they can stand it; the trout season has been open for at least six weeks, and the trout are usually far off, while the bass are close at hand; May 30 is Memorial Day and a State holiday. It was formerly called Decoration Day, and was set apart for the semi-religious purpose of placing flowers on the graves of Civil War veterans, and has been adopted in many States both North and South, but as a holiday few observe it in the manner that it was intended to be, while the masses find that ball games, horse races, etc., are more to their taste, and the observant angler, noting all this perversion of the day, naturally asks: "Why can't I go a-fishing for black bass?"

The question is a natural one. He has no particular interest in dead men who persist in remaining dead, and he sees others making merry on that day, and why may he not fish? He also sees that the black bass hold their own when they are given what I have shown to be half a chance, and why should he miss a holiday, or why should he wait until July before he can wet his line in the clear, cool waters of Champlain and other lakes and streams?

These are questions that an angler asks. Personally I do not fish on Memorial Day. As a member of the G. A. R., there are duties to be performed in "God's

Acre," and I am one of those who heartily applauded the Mayors of Bridgeport, Stratford and other cities in Connecticut for refusing circus licenses on that day—and I dearly love a circus; but while the racer races and the baseballer balls, surely the peaceful angler may angle without protest from any. When we can't make our neighbors think as we do, the next best thing is to compromise. Puritanism, like all crankism, allowed no compromise; but to-day we are more liberal. With these things in mind it seems best to let the black bass fishing open on May 30 in the State of New York, the main argument being that, having restrained their ardor until this date, you had better not try to pull the curb too hard, for if you do there will be a kicking over the traces, and there may be a demand for an earlier season from men who do not care whether there is a bass left when they have shown their string in the bar-room, but who have political "infloence."

It is a fact that in the New England States, which the late Prof. Louis Agassiz called a "Zoölogical Island," the s. m. bass has thrived while its brother has been neglected because of an absurd prejudice which we will consider later, but will here say that I mean the prejudice, which has become popular, of considering the big-mouth black bass to be an inferior fish. A man can only speak from his own knowledge, if he speaks authoritatively, but he may talk like a parrot.

Parrot talk has hurt one of the best of American game fishes. It has denounced it as a "vulgarian" (see my sketch of "Virginia Men and Fishes" in FOREST AND STREAM of March 12). The only men who have written of the two species of black bass, and who have not spoken slightly of the game qualities of the big-mouth, that memory recalls are Dr. Henshall and myself. Dr. Henshall did more to bring the gamy qualities of the black basses to the notice of the angling world than all the American writers on fish put together. In his splendid volume, "Book of the Black Bass," he has reared a monument to these fishes and to himself, and when we read the last of his 460 pages the subject seemed to be perfectly covered; but under the title "More About the Black Bass" he gave us 200 pages more, and as full of interest as the former work.

Before quoting from the Doctor on the comparative gameness of the two species I will say that he uses the term "large-mouth," which I never do, because it seems awkward, bookish, or is not, to me, so expressive as big-mouth, yet the word "large" is the antonym of "small," and a captious critic might say that if I use "big" I should also speak of the "little-mouth," but that seems awkward and not euphonious, and there is a heap in euphony, sometimes.

In his first book, pp. 140, 141, he says: "Where the two species coexist in the same stream or lake, the large-mouthed bass always grows to a larger size than the other species, and an angler having just landed a 2lb. small-mouthed bass after a long struggle next hooks a large-mouthed bass weighing 4 or 5lbs., and is surprised, probably, that it 'fights' no harder, or perhaps not so hard, as the smaller fish—in fact, seems 'lazy;' he therefore reiterates the cry that the small-mouthed bass is the gamiest of fish.

"But now, if he succeeds in hooking a large-mouthed bass of the same size as the first one caught, he is certain that he is playing a small-mouthed bass until it is landed, when to his astonishment it proves to be a large-mouthed bass; he merely says 'he fought well for one of his kind,' still basing his opinion of the fighting qualities of the two species upon the first two caught.

"Perhaps his next catch may be a small-mouthed bass of 4lbs., and which, though twice the weight of the large-mouthed bass just landed, does not offer any greater resistance, and he sets it down in his mind as a large-mouthed bass; imagine the angler's surprise, then, upon taking it into the landing net, to find it a small-mouthed bass, and one which, from its large size and the angler's preconceived opinion of this species, should have fought like a Trojan.

"Now, one would think that the angler would be somewhat staggered in his former belief; but no, he is equal to the occasion, and in compliance with the popular idea, he merely suggests that 'he is out of condition, somehow,' or 'was hooked so as to drown him early in the struggle,' and so, as his largest fish will necessarily be big-mouthed, and because they do not fight in proportion to their size, they are set down as lacking in game qualities—of course leaving the largest small-mouthed bass out of the calculation."

There you have Dr. Henshall's opinion, and I indorse it. Years ago I wrote that the fighting weight of a black bass is 2lbs., and it is true to-day. By this I mean that a 2lb. bass will often make the angler believe that he is over twice that weight, while a larger one will not put up as stiff an argument, certainly not in proportion to its avoirdupois. My own experience is that at 2lbs. weight the two species are equal in gameness. In the second paragraph quoted Henshall says, "still basing his opinion of the fighting qualities of the two species upon the first two caught." To this I would add: if not prejudiced by what others have said. There is an old adage about giving a dog a bad name, and another which says: "A lie will travel round the earth while Truth is pulling on his boots." These two sayings fit the case. Men follow like sheep where one leads, and anglers are men, with few exceptions. The big-mouth has been so lied about by well-meaning anglers who would never lie about the size nor weight of a fish that an action for slander would lie. The Spanish have a saying that Inferno is paved with good intentions. I have paraphrased this by often saying that it is full of well-meaning people; who on earth can work more mischief? The well-meaning angler has heard some older one declare that the b. m. is lacking in game, and repeats the slander partly to show his own knowledge and partly because it is easier to have opinions already cut and dried for us than it is to work them out in an original manner.

If—stick a pin in that "if"—it can be proved that the big-mouth is not quite as gamy as its brother, say only able to stay for a dozen rounds in a finish fight, to which I do not agree, then let me ask what other fresh-water fish, barring the trout, if you will, compares to him? Surely not the perch nor the pike, and all Europe has not his equal among what they call "coarse fish," a term meaning all but the salmon tribe.

Food of the Black Bass.

The food that any fish prefers indicates the lures by which it may be taken. The teeth of fishes are not as sure a guide to their food as are the teeth of mammals, yet those of the pike are purely piscivorous. The bristle-like teeth of black bass may be used to hold fish, but do not denote a preference for that diet. Where crayfish, which in parts of our country which were settled by Germans are called "crabs," are abundant, they are a favorite, especially when they have moulted and are soft. Insects and their larvæ and pupæ come next, especially that much-named larva and pupa of the *Corydalis cornutis* which I early learned to call a "dobson," but seems to be more generally known as a "helgramite." Then comes the frog as a *bon bouche* if the bass can get one, but in bass waters the frogs become educated, and the progeny of one which has left a leg with the bass will keep near shore, and when on the bank and compelled to plunk in immediately turn and come up under the bank; no deep water for them. Grasshoppers, crickets, flies and small fish about complete the menu of the bass, but fish are but a small part of it, smaller indeed than that of the perch of Europe, which we have to distinguish from other perches by calling it "yellow perch," "ringed perch," etc.

While speaking of food and baits for the bass, the temptation to give another rap at those fly-fishers who are sticklers for natural flies is too strong to resist. At Cold Spring Harbor on the north shore of Long Island, N. Y., there is a large mill pond fed by springs and ponds above, and I stocked this with black bass in 1884. A short stream below the dam connects it with salt water, and after the bass had become plenty I fished it by way of experiment in many ways. One day I gathered a lot of fiddler crabs from the salt marshes and tried them, and the bass took them greedily, although they had never seen such a thing before, and there are no crawfish or other crustaceans larger than the little gammarus in the fresh waters of Long Island. The "fiddler" is a burrowing crab about an inch wide by about half that length. The female has two small claws, but the male has one great claw, which is carried across his front and is nearly as large as himself.

To the old question: "What does the salmon take—or mistake—the fly for?" I may respectfully add: What did those bass think a fiddler crab was? My own answer would be, as in the case of the trout, there was no thinking about it further than this: a fish sees something stir, and it may be alive and good to eat. The fish will try it and eject it if the strange object is not palatable. The question of a concealed hook, which is prominent in the mind of the angler, does not occur to the fish the least little bit, not even to one that has been pricked with the hook, for there are few nerves in the mouth of a fish, and if it is hooked, struggles and backs away, it has no knowledge of the actual danger it was in, but merely grows cautious about attacking things which might prove troublesome.

Outside of the instinct of self-preservation, a fish, one of the "lowest" of vertebrates, has not the fine nervous organization of the mammal, the bird, the batrachian nor the reptile. It feels little pain from a wound, whether a cut or bruise, and its intellect, if it has one, is very feeble, being confined to the bare necessities of existence. The insects seem to be endowed with all the "instincts" that the fishes have. "To live, procreate and die" seems to be the limit of enjoyment of much of animal life, but we can't expect that they will be up on trigonometry. Browning, Walt Whitman and the dry-fly question.

[TO BE CONTINUED.]

Dry Fly-Fishing.

BY GEORGE A. B. DEWAR (AUTHOR OF "THE BOOK OF THE DRY FLY").

In Three Parts—Part II.

Stalking the Trout.

Dry fly-fishing is mainly resorted to where very clear, quiet-flowing waters are concerned, and it is here that the trout are necessarily most wary and shy of the approach of man. The dry fly-fisherman casts, whenever he can, up stream to his rising trout for two reasons, first, because he can in this way cause the fly to float more naturally, and secondly, because he is far less likely to scare the trout than were he to cast down stream. But though a trout has not eyes at the back of its head, it has a habit very often of observing the approach of the enemy even when that enemy is right behind its tail. Unless therefore the angler is fishing the opposite side of a fairly broad stream he should get into position for casting in a distinctly insidious way. Let him always keep the point of his rod well down. The rod really seems to alarm trout as much as the gun does certain wild birds, and when it flashes in the sunlight, or is held almost straight up, it will cause a perfect panic among the trout of our clear streams. It is curious how many otherwise accomplished anglers manage to scare and set down fish by careless carriage of the rod. Not only is it well to keep the rod down in carrying it, but where practicable the good angler often prefers to keep it down as much as possible in casting. What is called the underhand cast is precautionary as well as thoroughly workmanlike. The more the rod is flourished over the head the more risk is there of frightening the trout.

A trout's rise or supposed rise having been observed, the dry fly-angler will constantly have to bend down low and advance within range very slowly; at other times it is absolutely necessary to go on hands and knees, and occasionally one must simply crawl or drag one's self along the ground to the scene of action. In dibbing with the dry fly—an exciting branch of dry fly-fishing to which I shall hope to refer—I have again and again taken off my hat, and flat on the ground, drawn myself to the edge of the stream, for this has been the only way of approaching the trout sufficiently near for the purpose. It may be frankly admitted that there is not much stalking needed when the stream is broad and the trout are rising under the opposite bank. A trout, I fancy, does not see you so well when you are opposite him as when you are above or below him; at any rate he does not seem to

take nearly so much notice, and that is the great point. The greatest care in stalking is necessary where the banks are high and the angler is not wading—this I think is almost the most difficult of all conditions for dry fly-fishing—or when there are almost no banks at all; the water being practically flush with the surface of the ground, and no cover. Hands and knees have to be frequently resorted to in these cases, and the angler must keep away from the water as much as possible. I have found a little cover go a long way—a few blades of coarse grass, a few rushes, even a big thistle, will help greatly if the angler carefully avails himself of this apparently meager shelter. Ronalds, author of the charming "Fly-Fisher's Entomology," and usually very accurate, was not right, I think, when he wrote that the trout's vision was so keen that it could penetrate even a bush. It is a clear cut figure against the skyline, or a sudden movement, or the flash of a rod, which alarms the trout so invariably. Given a small amount of cover, the angler, by very deliberate and gentle movements, can usually get well within casting distance of even the wariest trout. Failing cover in between one's self and the trout, cover immediately at one's back is better than none at all, provided of course it be not so high as to make casting impossible. In some dry fly waters wading is allowed, and it is then often much easier to approach trout without scaring them; but indiscriminate wading is a simply abominable practice in a clear dry fly water. It disturbs the water shockingly, and sets down shy trout sometimes for hours.

Stalking a fish carefully is often necessary, not only in order to avoid scaring that particular fish, but also in order to avoid scaring several others feeding hard by, whose turns should come presently. By frightening fish situated between one's self and the selected feeding trout, one often finds, moreover, that the latter is alarmed and set down through the commotion caused by the former. A scared trout frequently scares several others, where the stream is well stocked, and few things are more irritating than this to the angler who knows he has himself to blame.

As a rule it is best to get as near one's trout as possible. Some anglers prefer to fish "far and fine" with the dry as with the wet fly, but to my mind "near and fine" is commonly better. A fish hooked with a long line gets away much oftener than a fish hooked with a short line, and besides one can see more what the trout is doing at close quarters. The shorter the line the more careful the stalk must necessarily be. Of course no matter how careful the stalk the attempt to put the floating fly over the rising trout at close quarters must in the long run mean the scaring of more fish than where the longer line is used in casting; but notwithstanding this, I shall always prefer to get as near my trout as I can to casting to it from a distance. I like to see if possible the whole performance, which adds greatly to the interest of this branch of angling. When the trout is seen rising distinctly at the artificial fly, it is well to give him time. A fatal inclination under such conditions is to strike too soon.

The strike really is or should be nothing more than a twist or twitch of the wrist, which is quite sufficient to drive the barb of the hook home. In wet fly-fishing, so far as I have observed, and so far as my own personal experience goes, the angler does not by any means always strike—unless fishing up stream—until he feels his trout, and then the strike is really the tightening of the line, caused by raising the top of the rod, the beginning of the process known as playing the fish; but in dry fly-fishing the angler should strike directly he sees the ring, that is in cases where he cannot see the trout. Where the trout is distinctly seen somehow one does not as a rule notice the ring, perhaps because one is so engaged in observing the fish itself, and then, as I have pointed out, there is often a fatal inclination to strike too soon. When the trout is thus seen rising at the fly, the angler will do no harm by allowing him to turn before striking. Some anglers try to accustom themselves under these circumstances to count say three slowly before striking. It may be hard to school one's self in this way, especially where big trout are concerned, but it is certainly easier when the whole performance has been observed to fail through striking too soon than too late. There have been anglers professing to disbelieve altogether in the strike; but I am sure it is necessary in dry fly-fishing; only a certain proportion of fish will hook themselves. A gentle feeling at the line by a slight slow movement of the rod to make sure whether a trout has taken or no, is nearly always fatal, for the hook will come away. Strike therefore with decision, but not too hard.

Remember that the finer your tackle and the smaller your hook—we often dry fly-fish with a 000 hook—the less considerable must the sudden strain be. As regards these very small hooks I must say that I do not take very kindly to them. They come away from a fish's mouth more easily than a fair-sized hook. At the same time in clear waters when the dry fly is used they tempt more shy and well educated trout, and as the season advances they become more and more necessary no doubt during the daytime. Fine gut, nicely tapering, attached to a nicely tapering line—I commonly use one of your American waterproof trout lines—is very desirable for this dry fly work. Coarse casts will often set down the fish.

Angling last Mayfly season one broiling Sunday afternoon on the headwaters of old Izaak's favorite stream, the Lea in Charles Lamb's "Pleasant Hertfordshire," I found only one fish stirring. This was a huge trout of perhaps 6lbs. or more in weight lying in the shallows and now and then leisurely sipping down some minute object, probably one of the "fisherman's cusses." My cast was rather coarse, as I had been using May fly, it being the time of the imago of that insect called with us the spent gnat. I attached a small fly to this cast, got into position, and sent a long line up stream over the great fellow. It was a fair and a straight cast, and the fly gently fell on the water a foot or two above the trout's nose. He noted the gut and rushed off in wild alarm. Two hours or so later I found the fish back again, and cast to him with exactly the same humiliating result. That trout knew a good deal no doubt, but the sight of anything save the finest gut will terrify much less edu-

cated trout in very shallow, clear and slow water. A fine cast is a thing one must not do without in dry fly-fishing, save when May flies or some other equally big artificials are being used.

I wrote with interest this observation of Mr. R. B. Marston in his paper on the brown trout in Mr. Cheney's Fisheries, Game and Forest Commission Report for 1895, which I have just been fortunate enough to add to my small angling and natural history library: "If the brown trout retains in American waters the same characteristics that he has here, then I think American anglers will find that it requires more pure skill to deceive him and successfully land him than any other fish in the world, weight for weight. If this is so, it will give him an additional value in their eyes."

Some Dry Fly Difficulties.

It is the great object of the dry fly-fisherman to imitate closely nature in order to deceive the trout. Therefore the artificial fly should float down over the rising fish, just as the natural insect floats down. As already mentioned, it is usual for the fly-tyer to imitate the insect known as *Ephemeridae*, which have upright wings. The angler's fly, accordingly, whether it be an imitation of May fly or of dun, must float or sail down stream with erect wings. It is true a trout will sometimes take the artificial when it is lying flat on the water, provided it is floating well; but the most shy and educated of our chalk stream fish will often scarcely deign notice, much less take, an artificial which is not floating with well "cocked" wings. Flies are made nowadays with split and sometimes with double wings, which when dry float well under favorable conditions.

But there is a difficulty in dry fly-fishing which no tackle inventor has so far been able to overcome in the least, or reduce, and which, I fancy, he never will, namely, what is called the "drag." The "drag" is easy to explain, if passing hard to defeat. It occurs when the current takes hold of the angler's line and drags the artificial fly at a greater rate than it would travel if attached to nothing; the "drag" pulls the fly down, thus taking all the "cockiness" out of it, and ultimately drowns it. The trout with any pretensions to education or enlightenment will have nothing to do with the fly in these cases, and occasionally it will so offend him that he will at once cease rising. These extreme cases where a "dragged" artificial actually causes a trout to cease rising are scarcely credible to some anglers, and I for one have been reproached for exaggeration in dwelling upon them; yet that there are such cases I am quite sure, and so I know are other anglers who have studied trout at all closely. Indeed the sight of an artificial floating naturally will apparently offend a rising chalk stream trout at times—though fortunately such cases are not very common.

The drag occurs of course by reason of the stream being stronger at some point between the angler and his artificial fly than on the piece of water on which that fly is floating, and to avoid it the angler has recourse to various devices. He will try to so alter his position in casting that his line shall not fall upon the stronger current. Sometimes he will, in order to avoid the drag, have to cross the stream and try and assail his rising trout from the other side. And at other times, if this practice is allowable, he will wade out into the stream and cast from a more favorable position. Again he will keep a little spare line in his hand, and pay this out to the current, hoping thereby to save his artificial from being, as it were, instantly knocked over and drowned. The spare line cure is occasionally effective, as it may save the artificial for a matter of moments, and meanwhile the trout may rise and get hooked; but only occasionally. Where a trout is rising in a still or almost still pool, and go where the angler will there is a bit of rapid water between that pool and himself, the "drag" is practically unavoidable. The trout sees the artificial directly it alights perhaps, comes at it, but before he can seize it the resistless current has dragged away fly, cast and all. The lure is again presented to the hungry trout, and the same thing again takes place. After a while the trout grows weary of this phantom and takes no further notice of it.

I have only known a very few cases of trout in good condition—"mens sana in corpore sano"—taking a "dragged" artificial in dry fly-fishing on chalk streams, though the grayling is not always so particular in this respect. The "drag" is more constant in the sharper flowing streams, which twist and turn about a good deal. Such streams form many a miniature backwater, which the trout have to frequent because the natural fly gets driven thither by the current, and can then be captured by the rising fish at a slight exertion. The lower lengths of our (Derbyshire) Wye, which are familiar to so many Americans who come to see Haddon Hall and Chatsworth, and often stay at the far-famed Peacock Inn, are full of such miniature backwaters, and the dry fly-fishing on this river is accordingly very difficult.

Sometimes the drag may be avoided by the angler going above his fish, and casting a dry fly down to it. This method is known as "drifting" the dry fly, and its advantage is that the fly having a good start of the line will not drag till the line, as it were, catches it up. But "drifting" the dry fly is a very difficult thing to execute satisfactorily, and I fancy most anglers could count on their ten fingers the number of good trout they have captured by this device. The best way to defeat the drag is to avoid it by getting if possible into a position where it may be at any rate minimized. Only practice and experience will enable the angler to overcome difficulties of this kind, together in some cases with a thorough knowledge of the water.

As we have seen, it is of prime importance that the fly should float well. In wet weather it is really hard work to keep the fly from getting "water-logged," because it tends to become saturated with the rain, even while the angler attempts to dry it in the air. The May fly, owing to its size, is particularly difficult to dry properly on rainy days, and one may blister one's hands very easily over the work, even if they have been holding the rod a good deal for some time and have therefore become fairly hard. To make the fly float well very many dry fly anglers now touch the hackle or wings with a little paraffin or oil. Small bottles of scentless paraffin

are sold for this purpose with a camel-hair brush attached. Paraffin certainly does work wonders. A fly painted with it will float for hours even on a wet day, and require scarcely any drying in the air. I frequently fish without paraffin, and in fine weather, especially when using small flies, do not much concern myself about it one way or the other, but for May fly work it is a great assistance in bad weather.

Perhaps, however, the chief difficulty of all—if we except that of inducing the terribly overeducated trout of chalk streams of this country to rise at all—is that of the wind. Accuracy, it must be admitted, is far more important in dry fly than in wet fly-fishing, and to put a fly lightly on a certain bit of water no bigger than a dinner plate when an adverse wind is blowing hard is most difficult. Some people profess to be able to cast a line in the teeth of a small gale; very likely they can, but all I can say is that I have never seen the feat satisfactorily accomplished, and feel certain that ninety-nine dry fly anglers out of a hundred will habitually fail at the first cast or two, and after that the trout will very likely begin to think that somehow there is too much line and gut flying about the water to make feeding a safe and pleasant occupation, and hence he will retire for a while. Accuracy is indeed to the vast majority of dry anglers a very hard matter in rough weather. The less wind the better is dry fly-fishing. A gale at one's back, it is true, enables one to get out a very long straight line, and to make the fly travel into the opposite bank of a broad stream, but I have known it to bring the fly straight back into my neck or cheek in a way that has made me consider the advisability of giving up fishing for the day. Then, too, the fly, though it may travel straight out when the wind is behind it, will be inclined to fall on the surface of the stream like a little stone; and this is the reverse of attractive to the trout. No, depend upon it, the less wind the better for genuine dry fly work.

Under these circumstances it is distinctly unfortunate that several species of the *Ephemeridae* family of insects should often hatch so freely on roaring days, and that trout should feed on fly so persistently at such times. If there is no wind there is quite likely no fly hatching, and consequently no trout moving at surface food.

Peculiarities of Trout.

APROPOS of Mr. Mathew's argument in the April 23 number of FOREST AND STREAM, regarding the taking of flies by trout, I will relate an experience of my own.

Some years ago I was fishing the Pocono Creek in Monroe county, Pa., and one hot noontime I strolled into the deserted blacksmith shop which spanned a portion of the stream flowing through the village of Tannersville. I was guided to the place partly by the hospitality suggested by the open door, and by a desire for shade. As my eye roamed around the interior it was attracted by a knot hole in the floor, and knowing the stream flowed underneath I got down to look through, in the hope of seeing something that would be of interest. To my surprise I saw five or six large trout lying quietly in the shadow, their fins gently moving. They seemed to be the embodiment of languor, intensified perhaps by the general heat prevailing.

After watching them for some time and until fully satisfied with the spectacle, the next thing, of course, was to stir them up. As horseshoe parings were plenty, I picked up a small piece and dropped it through the hole. As it touched the water every trout sprang into motion. The first one to seize it turned and shot away, ejecting it at the same instant. As it zigzagged through the water, slowly settling, it was taken by another, who went through the same performance, then by a third, and so on until all had satisfied their curiosity by taking it in their mouths and voiding it.

After waiting an interval I dropped a second piece. Again a trout arose, took the paring in his mouth, emitted it and swam away. Before it reached the bottom of the creek another investigated it in the same manner, but the remainder took no further notice of it. After another interval a third piece was dropped. This time but one trout made a motion toward taking it; he approached within a few inches of the morsel, then turned and languidly sailed to his former position. Further efforts in a like direction failed to arouse in them any more interest in the experiment.

This portion of the stream flowed through the tannery grounds, and the trout were preserved, otherwise the experiment would have been carried further. In other words, I would, after the first enlightenment, have tied a piece of the paring to a naked hook, and from a suitable spot made a cast under the building. I am morally certain I would have hooked a trout.

On another day, during the same trip, I was on the meadow above the dam. The water there is quite deep, considering the size of the stream, say 3 ft. or so, and the banks were lined at that time by a thick growth of alders. I had crawled through them to the edge of the stream, and as I lay stretched out, looking on to the water, I saw directly in front of me a trout lazily maneuvering around, but never moving far from a central point. He would move up stream a few feet, then, apparently, standing on his head at about an angle of 45 degrees, slowly drift back. Then he would take little side excursions, but all in an aimless manner, as though imbued with the languor of the lotus eaters. As I watched him, admiring the flash of gold and crimson that was revealed at intervals, when he slowly turned, my ear caught the sound of a slight splash on the water above. Glancing in the direction, I saw a gang of flies being lifted from the water; again came the cast, and from the masterly way in which the flies were dropped I knew that Milt Woodring, a native of the stream and the locality, had hold of the rod. Now, thought I, is my opportunity of seeing a wild mountain brook trout take the fly. Slowly but surely down stream came the flies, 6 ft. away, 3, 2, then directly over the trout, with as fine a cast as one could wish. The trout at that particular moment was enjoying one of his drifts back while standing on his head, and was about a foot under water. Again came the cast, this time a trifle behind him, but they provoked no flurry, no excitement; they made no change in his movements; whether the surface of the

water a few inches above him was being thrashed in streaks and little whirlpools by the restless flies, or gently ruffled by the passing wind, it was all the same to him. It was not until the immediate presence of the wading fisherman intruded on his domain that he moved away.

I have been on the stream and seen trout, 20 ft. away, scurry for their lairs as though the devil were after them, and again have had them break all around with impunity when casting.

I have passed the fifty-mile stone, and still lie awake nights pondering over the eccentricities of trout.

R. K. B.

PENNSYLVANIA.

Fishing Up and Down the Potomac.

Choppewamsic.

CHOPPEWAMSIK CREEK is a little run which empties into a tide-water marsh a mile and a half south of Quantico on the Virginia shore. The tortuous channel of the creek, as it approaches the river, takes the course of a letter S with its perpendicular axis parallel with the shore.

When the Richmond, Fredericksburg and Potomac Railroad was built it followed this imaginary axis, and therefore crossed the winding channel three times in its short course over the marsh. As sand and wood boats occasionally passed up the creek with the tide, this was a navigable stream, and a drawbridge was placed at each crossing only a few rods apart.

This arrangement was so expensive to the company in maintaining a man in charge at each bridge, and the delay to traffic on the road so serious, from the time required to operate the rude hand-power draws, and so annoyed and delayed the boats trying to make the passage, that the railroad company finally filled up the two upper crossings, and changed the channel of the creek to run directly through the last bridge. Thus the two fills cut off a horseshoe curve of the old bed of the creek. Into this the tide enters by a couple of foot-square culverts in the uppermost fill, and the result is an ideal fish pool.

The culverts let in the pike, carp and bass from the river, and twice a day the tide pours in loaded with fish food. The water does not come directly from the river, but sifted by the vegetation of the marsh, is nearly always clear, so that fishing may be found here when no other stream, for the length of the Potomac, is in condition.

The pool has long been noted for its pickerel, and as these north-country fish are lively in much colder water than bass, we have been in the habit of making our first spring trips here, beginning as early as February, but always till last year with the minnow or spoon, fishing from the railroad bank and catching nearly all our fish at the culvert, on an incoming tide, as they gathered there to feed.

Something over a year ago large-mouthed bass, with which the Fish Commission has stocked all the tributaries of the lower river in reach of a railway, were noticed in considerable number.

Then we left our coarser tackle at home and made a raid with the fly. The bridge tender had a couple of gunning skiffs, and these we hired him to put over the bank into the pool. With a native colored boy to paddle we set out among the lily-pads and mossbeds. The boats were cranky as a racing shell, but we had spent many an evening on the Potomac in just such, and when they are well handled there is no better fishing craft for the fly-caster, in quiet water. We found the bass plenty and hungry. They were in the shallowest water, and it was clear as crystal, so it became a matter of approach and reach, as fly-fishing mostly is anyway, but we were abundantly rewarded.

Then we had a new experience, and a new delight, added to a cup already full. We found the pike taking our fly, and for short, sharp, vicious biting and fighting he has no peer.

The older books on angling tell of catching pike with a fly, and several give cuts of the nondescript animal to be used—fully 6 in. long—the body of a mouse, with wings nearly as large as those of a Mother Carey's Chicken, and built about a tarpon hook.

Such an engine may be necessary for the large pike of higher latitudes, but for the little *Reticulatus* of these waters it would be of little service, and the finest bass tackle makes the best sport.

Twenty-two inches is a good-sized pickerel here, though we have "seen signs" of some monsters that much exceed this, and 8 lbs. is the claim made for the record fish. A couple of our friends on one trip were using one of the boats, skittering a minnow; a ½ lb. bass had taken the bait, and was being helplessly hurried to the skiff, when it was seized by a large pike. After an exciting struggle, in which he ran about as much as he pleased, though almost netted in his rushes past the man with the paddle, he broke, leaving the bass thoroughly crimped, and quite dead, to say nothing of the two men in the boat. Since then he has made several demonstrations—enough to keep alive a hope that he will yet be ours. He is known as the Five-pounder, though of course that is pure conjecture.

Our flies for bass are tied to No. 4 hooks, as anything heavier does not cast well from our light rods. For the pickerel two or three threads of Christmas tinsel tied to the head of the hook, we thought, made a fly more killing. This did not add appreciably to the weight or at all interfere with the cast, and made the fly much more showy, with the gleam of the minnow or the spoon; either we or the pickerel became educated past this rude device, and we could not fish finer or further off, for grayling or trout, than we now do for this coarse fish, and the sport is not to be despised, even after Nepigon trout.

Few fish are more deliberate with a gorge bait than the pike; the general directions of most authorities are that nearly the only way to lose him is in failing to give him plenty of time to pouch. But on the snap few fish are his equal, and at the fly none his superior. This is a deliberate challenge. From his lair in the weeds or beneath the floating leaf he will rush sometimes for 20 ft. on the surface of the water, open-mouthed, at the fly, not taking it with a gulp as does the bass, but with a vicious snap that threatens destruction to the hook and

makes the angler glad there is a length of line between his hand and the fish. His mouth is bony, the membranes thin, and if not caught in the gills or tongue the barb must be set quite through the bone to hold, for he goes up in the air and turns such somersaults as earn and secure his freedom many more times than the angler would have, if he had everything for the asking. The teeth are sharp as needles, but round, and the gut of the fly is not badly worn, and never bitten as one would expect; it slips between the teeth. But the feather work of the fly is pretty badly demoralized after it has enticed three or four pickerel. Round almost as an eel, nearly as incorrigible a squirmer, and nearly as slimy, the pickerel ceases to amuse after he is landed. The best plan to handle him, the writer found, is the key of a patent binder, which opens like scissors, only different, and inserting this in his jaws and forcing them open, he is helpless, and as the jaws open very wide, the hook is easily extracted. This was not resorted to until a gentler effort resulted in one of the needle teeth piercing a finger nail like paper.

As an article of diet, always a matter of taste, the pickerel with us ranks third—from the bottom. The chub last, then carp, then pickerel, and these are now the perquisite of the boatman.

The record catch of pickerel here was 50 lbs. to one angler, but this was with minnow, and before the place became so popular as to attract the net fishermen, who try each year to rake it clean, but so far have not succeeded in getting them all.

The marsh between the pool and the river is covered with a rank growth of cattails, which is usually burned off in the winter by some local hunter to make snipe grounds for the spring shooting.

Very high tides occasionally come over this from the river, and on one of our early trips last year an unusual spring tide covered it to the depth of a foot or more. All over this great fish were splashing about, which we could hear and see for twenty rods.

Curiosity drove us to investigate, and the boatman paddled out over the already sprouting bed of cattails; we approached without difficulty, great carp swimming about in twos and threes, always close together, apparently excited, and sometimes making plunges that threw showers in the air. They seemed at least of 20 lbs. weight and hundreds in number; they were apparently spawning, though the low tide left no water in these shallows, but they moved on too rapidly to be on the feed. The landing net was passed over the heads of preoccupied couples as they passed, but the net was so small and the fish so large that it was not much more dangerous to them than to us. Their frightened plunges when thus disturbed in the shallow water so liberally sprinkled us that we were glad to desist.

The bass here, like all those of the lower river, are the large-mouthed, mostly from Illinois. The tide brings in minnows, perches and mudshad, and the bass take their places near the culvert, with the pickerel, and make alternate rushes for the passing schools. At any rate, if the pike ever get the advantage of them, it was never apparent to us. When of equal size they never seem the least disturbed by the other. The pike is the bully of the pool, but the bass is the policeman, with considerably more dignity and quite as fine a courage.

One of our memorable trips here, and we have had many, we had taken the 4:40 P. M. train from Washington, reaching Quantico at 6 o'clock. Sending our traps across to the hotel, we hailed a couple of boys for the boats, and started at a warm pace down the track for our mile and a half walk to get the evening fish.

When we were ready to begin operations it was nearly 7 o'clock and sundown; an hour's daylight left. The evening is perfect; there is just the cat-spaw of a ripple on the water, but plenty for this hour. The wooded hills, the dark water, with bass breaking up and down both sides of the pool, the soft summer evening haze; we feel all this, as well as see where

The sun hangs low adown the western sky;

Its length'ning shadows gloom the wrinkled pool;

The chattering halcyon flits with nervous cry,

Or hovers still—to shoot down bye-and-bye;

Thus day by day he decimates the school.

The cattails whisper still of Midas' ears;

Flame-hearted mallows nodding to the night;

The drooping lilies with their glit'ring tears,

The modest symbols of a maiden's fears,

In hammocks green—seem fairies, snowy white.

The sentry rails are calling in the grass,

The blackbirds quarrel ere they go to rest;

A flock of crows, loud cawing as they pass,

Are flying high, an inky, noisy mass,

To distant roosts in mountains in the West.

Beyond the pool a stilted crane stalks grim,

And peers for frogs about the mucky mash;

While high above, upon a blasted limb,

A fish-hawk sits, with feathers sleek and trim,

And screams defiance at intruders rash.

A quiet good-luck as we arrange ourselves in the skiffs, with the net behind within easy reach of angler or paddler and the bag of flies and comforts at our feet. We take the two sides of the pool, as the skiffs are pointed, and at the first cast outside the line of lily-pads a good bass takes the dropper; he has hardly warmed up to his work when a full-grown pickerel makes a break for the trailing tail fly and gets it; the little 5½ oz. bamboo has its work cut out, and the "racing and chasing on Can-nobie Lee" was probably a tame exhibition to the merry-go-round performance of the next few minutes. It was not easy to net both; the pickerel doesn't seem to know when he's whipped, but both were finally saved.

When we packed up to tramp back to supper the after-glow of sunset was spent, and the dark was on us, but we did not care; one rod had taken twenty-seven bass and the other forty-two. My friend had the larger score and had taken nine doubles. We were to fish the next day, and only killed enough for breakfast—three each—and the others had been carefully returned.

There are not many pleasanter walks than counting ties on a dark night. This sounds absurd, and yet that evening's stroll to supper, up the railroad track, with the signal lights of the freight yard and the little village bright below, and the spangled sky all bright above; the whippoorwills that come at your call, all about; the

plaintive cry of the screech-owl; the anticipation of a warm supper, delayed beyond our usual hour and the memory of the sunset on the water—well, there are many occupations in life duller than counting a limited number of ties under such conditions.

On one of our trips, when the wind had blown our skiffs off the lake and we were driven to try from the railroad bank, we noticed as the tide was coming in hundreds of bass on the outside in the creek, dozens coming close up to the mouth of the culvert. We watched them for some time, hoping they meant to enter, but they seemed to have no particular intention or business. They were not feeding, but moving lazily about; we offered them flies to no purpose, and even caught a couple of small perch and tried them with bait, but they ignored our attentions. Some doubt was expressed as to whether they were bass, and to settle that question the triangle was taken off a pike-spoon and thrown over one.

He moved deliberately away, but his place was quickly taken by another, which swam so directly toward the line that when it was twitched one of the barbs engaged his lower lip, and after a short struggle was landed a bass above 2lbs.

Then the fly was tried again further out, and whenever it could be dropped near a patch of weeds or floating grass we had a response. Standing on the high bank we were in plain view, and the bass would touch nothing we offered, but when the grass hid us, if a bass was behind it, he made for the fly, and we took a beautiful string all of a size. Several times since we have seen them here, but never again had anything like as good sport with them.

There are large fish here. The bridge tender late last fall saw one struggling helplessly on the surface of the pool, and secured it. It proved to be a bass with a big catfish fast in its gullet. Too large to swallow, the spines had prevented ejection, and the bass must have soon died. He took the fish to the village grocer and recorded its weight, something over 7lbs. We claim the mate.

HENRY TALBOTT.

New England Fishing.

Boston, April 21.—Of the R. O. Harding party to Newfound Lake, N. H., for landlocked salmon fishing, Mr. Harding was high line, and his friends are offering congratulations. He took one salmon weighing 8lbs., one of 6½lbs. and one of 6lbs. These fish were displayed in Appleton & Basset's window to-day, and drew a good deal of attention. The other successful fishermen of the party were J. E. Devlin, with a salmon of 7lbs.; E. H. Wakefield, Jr., one of 5lbs.; and Edward Brooks, one of 4lbs. Mr. Brooks and Mr. Wakefield remained at the lake for a few days longer, determined to get some larger fish. The party was quartered at Mrs. A. F. Sawyer's, the Masaquebec House, near which point excellent fishing is reported. The fishermen suffered a good deal from cold, their lines frequently being thoroughly iced in the morning, with plenty of ice in the boats.

At the head of the lake there has already been excellent fishing. J. W. Sampson, of Hebron, has taken a number of large fish. G. G. Fellows has taken one of 7lbs.; C. L. Eddy, one of 5lbs.; Charles S. Bates, of Boston, one of 4lbs. and one of 6lbs. A fisherman at Bristol has taken six fish in one day, and had four strikes, which he hooked and lost. Off Whittemore's Point one weighing 10lbs. has been taken, one of 8lbs., one of 6lbs., and three of 5lbs. each. The lucky fisherman's name is A. G. Dolif, of Bristol. C. E. Rounds, of the same town, has taken two salmon of 8lbs. each and one of 7lbs. E. A. Pike has also taken two salmon there of 7lbs. and one of 8lbs.

Such has been the fishing in Newfound Lake up to date. Later good fishing is looked for on lake trout. One has already been taken there—last Saturday—weighing 14lbs. The lake is noted for large fish of that description. Commissioner Wentworth, who met the Harding party at the lake and came out with them, is greatly pleased with the remarkable catches of salmon there of late; the best ever known. He is more particularly pleased since it is the work of the Commission in restocking that has brought the salmon fishing up to such satisfactory results. Concerning salmon in Winnepesaukee, the Commission is also very hopeful. They have been putting in salmon for some time, and some results are noted. It is a great body of water, and must necessarily take longer to restock. But it is believed that landlocked salmon will be a great success there at no very distant date.

Lake Auburn, Me., is open, and to Mrs. H. Haskell, of Auburn, belongs the honor of landing the first trout of the season. It was landed at 5 o'clock on Tuesday morning, and weighed 3lbs. L. Baker, of the same town, has taken the first salmon, one of 7lbs. This was landed after a fight of fifteen minutes, on Tuesday.

The ice is out of the lakes at Winthrop, Me., Maranocook and Anabesecook, and some good trout have already been taken. These lakes are really coming into note for large brook trout, after having been given up to pickerel for many years. First the lakes were stocked with black bass, and the theory of the Maine Commissioners is that the bass have destroyed the pickerel, so that the trout put in have had a chance to thrive.

Boston, April 23.—Landlocked salmon fishing at Sebago has stopped rather suddenly. Reports from that lake to-day say that very few fish are being taken. The theory is that the smelts, on which the salmon are feeding, have moved up into the rivers and streams, and that the salmon have followed them. In about a week, or as soon as the water is a little warmer, the smelts will return, and then another good run of salmon is expected.

Salmon at Newfound Lake have continued to come to the hook in good shape, and a number of Boston fishermen are off and will go as soon as business will permit. C. D. Lyford, of Cambridge, went to Newfound yesterday. He will stop at J. W. Sanborn's, Hebron, one of the best points on the lake for fishing, and the one from which a great many fish have been brought this season. Dr. T. F. Carrol, of Newton, is going to Newfound on Monday. John E. Devlin, of the R. O. Harding party, has gone to Newfound again. A party is also planned for Newfound about May 2, including J. A. Wade, F. O. Webber and George Robbins.

Lake Winnepesaukee fishermen are getting ready. G.

R. Leavitt and J. E. Hill will leave for Winnisquam to-day for lake trout fishing.

Reports from the Rangeleys mention an early clearing of the ice. Capt. F. C. Barker writes from Bemis that the ice will go out about May 1, all depending upon the weather. Mr. Sargent, of Sargent's camp, Mooselucmagutic Lake, though getting his rods ready to be off as soon as the ice is out, does not expect to be on the ground before May 5. Mrs. Sargent will be with him, as usual. He has visited the Rangeleys almost every year for about thirty years; has taken trout up to 9 and 10lbs. He is as fond of the sport as ever.

The departure of the ice from the Rangeleys for the past seventeen years has been as follows, the record being from the files of the FOREST AND STREAM:

1880—May 7
1881—May 9
1882—May 12
1883—May 14
1884—May 13
1885—May 15
1886—May 3
1887—May 16
1888—May 21

1889—April 30
1890—May 9
1891—May 10
1892—May 4
1893—May 20
1894—May 3
1895—May 6
1896—May 7
1898—

The weather will tell.

Lake Auburn is turning out some good fishing. A dozen good fish were taken the second day after the ice went out, which was on Monday, April 18. Boats can be had of Cy Metcalf, but one has to be booked ahead, on account of the demand.

The ice is out of Lake Cobbosseecontee, Gardiner, Me., and the fish are reported biting well. Over fifty boats were out on Monday, April 18. The first fish was taken by Harry Wright, of Providence, R. I. Camp Conway Castle is filled with fishermen. Among the number are Mr. Conway, Mr. J. L. Kenney, Mr. B. Dunn and Mr. M. McGawley. Trout fishing has greatly improved in that lake during the past few years.

April 25.—E. H. Wakefield, Jr., and Edward Brooks, of the R. O. Harding party, are just in from Newfound Lake, N. H. Mr. Wakefield got two salmon of 5lbs. each. Mr. Brooks captured a salmon of 4½lbs. and a trout of 5lbs. Mr. Brooks captured a salmon of 4½lbs. The above are Mr. Wakefield's first landlocked salmon, though he has caught about his share of trout. He is much pleased with Newfound Lake, and will go again later. His only complaint of the Masaquebec House, where they were quartered, is the way they treat fishermen there. A nice, warm fire, and four meals a day, are on the programme; eggs, coffee and hot toast at 3 o'clock in the morning, so that they may be on the lake at daybreak; breakfast at 8:30, or when they get in from fishing; dinner at 1; and supper when it is too dark to fish.

Mr. Lyford, of Cambridge, got a 4lb. salmon at the foot of the lake the first day he fished. On Sunday four salmon were taken at that point. On the way out Mr. Wakefield saw a beautiful salmon, 25in. long, in a box of just the right size. The fish was bedded with evergreens, and had a bunch of Mayflowers in its mouth. The name of the captor he did not learn; so much more interested was he in the beautiful prize.

The Sebago Club party of seven has just returned from that lake. They took ten salmon and one trout. The fishing was not as good as immediately after the ice went out, but in front of Camp Sebago sixty salmon have been taken thus far for the season. Mr. Fisher, of the party, was high line in three ways. He took the first salmon, and the largest one, a fish of 9½lbs. He also took a "square-tail," as they term them at that lake, or brook trout, of 4½lbs. They mention a rainbow trout, taken by one of the party, doubtless the result of restocking.

SPECIAL.

Early Spring Fishing in Canada.

THOUGH the season during which both trout and ouananiche may be taken in Canada "with an angle" only opens on May 1, it is very seldom that the condition of the ice and the water does not delay the opening of the angling season until the very end of the month. From May 20 to 25 is perhaps the average period for the opening of the spring fishing in northern Quebec, but on some few occasions the ice has not left Lake St. John until the first days of June. Most often it disappears from May 10 to May 15, and the fishing for ouananiche in the lake itself at Roberval and in the mouths of the Metabetchouan, Ouitchouan and other rivers flowing into it commences as soon as the ice has gone and continues there as long as the waters are rising, which is usually about three weeks. When the water of the lake commences to fall the fish gradually disappear from their earlier haunts, and the much prized fishing of the Grande Decharge commences. I have gone into all these details so that anglers may calculate for themselves, from the condition of the water, which I will report from time to time to FOREST AND STREAM, what time they should arrive at Lake St. John for the particular locality in which they desire to fish. I have had good ouananiche fishing in Lake St. John as early as May 20, and it has lasted in some years up to almost the middle of June. From June 20 to June 30, in the average season, the early fishing in the Grande Decharge arrives at its best, but I have had my best sport as early as June 12 in these rapid waters, and taken several 4 and 5lb. fish in succession in one afternoon. This year the season promises to be earlier still. Present appearances indicate that it will be at least ten to fifteen days earlier than usual. A month ago summer seemed to be breaking right in upon us, but since then we have had colder weather. Nevertheless we have already lost our ice bridge from the surface of the St. Lawrence in front of the city, earlier than it was ever known to disappear before, and a message from Lake St. John states that the ice is quite rotten and liable to sink at any time. It is pretty certain to go by the end of the month, and in that case we shall have ouananiche fishing in the first week of May instead of the third, and good angling in the Grande Decharge in the first week of June. For this early fishing anglers will do well to provide themselves with a number of flies tied on No. 3 and No. 4 hooks.

Trout fishing ought to be fairly good this year about the middle of May, and even earlier if the weather turns warmer, while the bottom fishing for the heavy trout in

Lake Edward, which is now open water, will be in full swing just as soon as the ice is off the lake, which may now be almost any day.

E. T. D. CHAMBERS.

QUEBEC, April 22.

CHICAGO AND THE WEST.

The Trout Season.

CHICAGO, Ill., April 21.—The beginning of the trout season in Wisconsin does not show all the results that could be asked. I have kept tab on the Prairie River through advices received by a friend from a resident on the banks of that stream, and the last news is that the weather has turned too cold and that it will be better not to go out after trout there until next week. That is, by the time this issue of FOREST AND STREAM is in the hands of the readers the trout outlook at that point should warrant one in chancing the trip. Of course the first flurry, before the mosquitoes begin to operate, affords the most enjoyable sport of the season, though it is not until the long-bills are biting also. I have not heard of any Chicago parties who have tried the Prairie as yet this spring. Mr. Edward Taylor I have earlier mentioned as bound for that point at any early date. Mr. H. L. Stanton, of this city, also wants to try the trout a whirl there, for he says he has not had a trout trip for five years. We have not many anglers here who understand trout much better than Mr. Stanton, and I should like to be with him on this happy little river next week. On May 25 Mr. Stanton, his friend Mr. Frank Willard and several others whose names are not yet certain, will go up to Squirrel Lake for a week with the 'lunge.

A number of anglers of West Superior, Wis., have been out this week along the streams of upper Wisconsin adjacent to their city, but their report is generally that of bad luck. The streams have not yet settled down into their natural flow, and no sport of steady sort has offered, the fish taken being dull and averaging very small.

Wautoma Creek and the White River near Princeton, Wis., have had a good quota of anglers this week, among others from Ripon and adjacent points being Messrs. L. E. Reed, H. P. Cody, H. C. Evers, E. J. Burnside, T. S. Chittenden and George Hill. It is very likely too early for much sport there, though these streams are among the first in the State to offer fishing.

At La Crosse, Wis., a great many men are ardent trout anglers, cultured on the many streams which run not far from that good angling point. The opening day contingent from La Crosse was a goodly one. Henry Heil and Benj. Ott tried the Mormon Coulee, Harry Hirschheimer went to Sparta, Dr. Gattedam, S. L. Bowlby and Henry Gund went to Galesville, Messrs. Joseph Boschert, Ed Richardson and J. E. Willing tried Lafayette, joined later by E. J. Tull and Judge Kleeber.

It appears to be one of the beneficent arrangements of nature that trout fishing begins just about the time jack-snipe shooting stops. The snipe are still here. Between the two the average Chicago man is keeping happy.

Bass.

Mr. S. A. Wright, of Sand Lake, Ill., writing to a friend in this city this week, says: "The fishing is good here now. Black bass and pickerel both feeding in fine shape. I had some jump clear out of the water after the bait. I caught a fine string yesterday, although the wind blew hard from the northeast."

West Michigan Fly-Casting Association.

Mr. Eber Rice, secretary of the West Michigan Fly-Casting Association, writes me with a very kind invitation to be present at the first tournament, June 8 and 9, which I shall certainly see if it be among the possibilities. Mr. Rice adds: "We propose to spend a couple of days among some of the finest trout streams in the world, which we have in the northern part of this State, and give a practical illustration of casting."

The West Michigan Association tournament, as earlier stated, is under the auspices of the Game, Fish and Dog Protective Association of Grand Rapids, Mich., and the competitions will be held at Reed's Lake, near that city, where preparations are already well under way for the events. The officers of the Association are John Waddell, President; E. Crofton Fox, Vice-President; Fred J. Adams, Second Vice-President; Eber Rice, Secretary-Treasurer. The address of Mr. Rice is 81 Lyon street, Grand Rapids, Mich., and he will send out a full printed programme to any inquirer. The rules are printed in the programme. There will be six championship medals as first prizes in each event, with many valuable merchandise prizes.

Protective Meeting.

The Michigan State Game and Fish Protective League has been called to meet at Grand Rapids on the morning of June 8. This meeting is for the purpose of considering the action of the Wardens' Convention at Chicago last February. Secretary Charles E. Brewster hopes that there will be a good attendance of this protective league; inasmuch as many members will be present at the fly-casting tournament.

One Good One.

April 23.—Messrs. George P. Rose, Jr., and Hugh Davidson, of La Crosse, Wis., with another friend, opened the season along the Kickapoo streams last week, taking 98 trout. Mr. Rose was so lucky as to get one good one weighing 3lbs. 2oz. He also took another weighing 1lb. 4oz. This is about as good a catch as I have seen mentioned this week. Reports coming from Wisconsin do not speak of very good luck thus far. Indeed, most trout trips have more hope than trout in them. Thus I hope we shall hear of better luck within the next ten days. The first week in May is usually the best of the season in Wisconsin.

Sooners in Michigan.

Michigan anglers are in the leash waiting for May 1. The Big Rapids Gun and Rod Club have established headquarters on the Pere Marquette River, and there will be several camps on the Little Manistee, the Boardman, etc.

Where was It?

Mr. C. H. Davis, of Superior, Wis., on April 19 caught in the Mississippi River a muscallonge 50in. long and weighing 33lbs. The fish was taken on a trolling spoon. If this was a Wisconsin muscallonge it was legal, but if the "Mississippi River" was in the State of Minnesota it would seem to have been illegal, since the law of that State forbids the taking of food fish between March 1 and May 1. Anyhow it was a pretty good fish.

Unconstitutional.

The Cedar Falls Rod and Gun Club, of Iowa, have been trying to get a fishway put in over the dam on the Cedar River at that point. The Fish Commission, Mr. Delavan, says that he is not sure the right of way can be condemned, as last year Judge Dewey, of Oskaloosa, declared the fish law unconstitutional, and the Supreme Court has not yet passed upon it. Of course any law which prevents any man from doing what he likes ought upon the face of it be declared unconstitutional, and it is a poor court which cannot issue a decree to that effect.

Distinguished Guests.

The West Michigan Fly-Casting Association has invited many distinguished guests to be present at its tournament, June 8-9, among others Senator Teller, of Colorado; ex-President Grover Cleveland, ex-President Benjamin Harrison, Hon. Chauncey M. Depew, Hon. William Jennings Bryan and Mayor Carter H. Harrison, of Chicago. Mayor Harrison is a skillful fly-fisherman himself, and was among the early anglers in the grayling days of the noble South peninsula, whose best streams he knows like a book.

The Record Cast.

On last Monday, at San Francisco, the famous long-distance champion, Walter D. Mansfield, broke even his own previously existing outdoor records and also the indoor record made by Mr. Leonard at Madison Square Garden last winter. Mr. Mansfield cast, out of doors, 120ft. 6in. It would appear that this record is very apt to stand for a time, as it beats Mr. Mansfield's next nearest cast by an even 7ft.

Would Steal the Fish Commission Next.

On last Thursday officers from Oconto broke up a gang of gill netters who were openly plying their calling near De Pere on the upper Fox River. Still bolder was the conduct of a choice lot of fishers who have been fishing with spears at Gill's Landing on the Wolf River, within a stone's throw of the headquarters of the Wisconsin State Fish Commission, which collects its wall-eyed pike spawners at this point. Deputy Johnson, of Oshkosh, made the arrests. This is the biggest nest of spear fishermen caught in Wisconsin this season, and as proof of their success at their sort of fishing it may be noted that over 500lbs. of pike were found and taken from them.

Incidentally I observe a little mention this week in regard to the work of the Wisconsin Commission, which states that the Commission has had poor success in getting wall-eyes for its propagating purposes at Gill's Landing this spring. It would appear that the best way to get these pike there is to spear them at night with jack lights. At least that is what the above-named gentlemen were doing, and they had very good luck.

Hon. Nat Cohen, the energetic and irrepressible President of the Illinois State Fish Commission, was in town this week, and paid the FOREST AND STREAM office his always welcome visit. There are two things which I should like to see come to pass: first, Mr. Cohen's favorite notion that it is wrong to fish under a dam in the spring run; second, my favorite notion that it is no good to compromise with fish dealers. I shouldn't wonder if Mr. Cohen would get his heart's desire a little ahead of me.

Discrimination.

We hear sometimes about the question of discrimination in the matter of non-resident licenses of one sort or another. Perhaps there may be some bearing upon this in the following note from the legal news:

"Discrimination between the citizens of different counties in respect to the right of fishing without a license is held, in State versus Higgins (S. C.), 38 L. R. A. 561, to be unconstitutional, as a denial of the equal protection of the laws."

E. HOUGH.

1206 BOYCE BUILDING, Chicago.

Wyoming Fishculture.

THE Wyoming State Fish hatchery, reports the Laramie Republican, was never in better condition than at present. All the upper ponds have been thoroughly cleaned, the buildings are in good condition, the troughs containing the young fish are as neat and clean as a new pin, and the fish, both old and young, have the appearance of vigor and health.

In the main building there are now 650,000 young trout, all of which will be ready for delivery in April. Of these 60,000 are the Von Behr, or German brown trout, 200,000 rainbow and the remainder Eastern brook. The brown trout and the rainbow are more suitable for the large streams of the State, such as the Big and Little Laramies, and the brook will be planted in the smaller streams. As they dart about the hatchery troughs the little fellows appear as healthy as they can be, and the loss amounts to almost nothing.

The next Legislature should make an appropriation adequate to put the grounds at the hatchery in good shape. With plenty of stone near at hand the expense is very small to construct proper walls to beautify the grounds. The trees which have been planted in the years gone by are all doing well, but more are needed, and a new system of pipes inside the hatchery will be a necessity before long, as the present pipes are becoming badly rusted. It is estimated that \$2,000 would make all necessary repairs and put the grounds in apple-pie order. There is not a single State institution out of which the people get so much for the money expended.

In order to fully realize the great good the hatchery

has done the State it is necessary for one to reflect back say fifteen years. At that time there was not a trout in the tributaries of the North Platte, and many doubted whether they would live in those streams. Note the change. Every stream in the State is populated with the finny tribe, and some of the tributaries of the Platte are among the finest trout streams on earth. Where can one go to find such fishing as on the Big Laramie, where the lordly rainbow sports on dashing rapids, or lurks in cool retreats? Aside from the immense revenue brought to the people of the State by tourists who delight in the pleasant pastime, thousands of pounds of health-giving food is annually taken from the waters of the State for the benefit of its people. As an investment the State has no cause to regret the money spent for trout. It has been returned ten times over in food alone.

The Republican would be pleased to assist the Wyoming Fish Commission in advocating the passage of a law which would furnish mutual protection to those people of the State who delight in the pleasures of angling and the ranchmen who dwell along the streams as well. The waters of the State and the fish are the property of the people, and some equitable way should be devised whereby the people can have the right to fish in the streams of the State, so long as they obey the laws in regard to fishing with hook and line, close sea-

TWO OF THE GROUP OF FOUR ATLANTES

surmounting the clock tower of the New York Life Building, in which is the FOREST AND STREAM office, No. 346 Broadway. The colossal size is indicated by the figures of the men who were photographed with the Atlantes, as here shown, at the works of Mr. W. H. Mullins, Salem, Ohio, where the group was done. The piece ranks with the most artistic examples of exterior decoration in New York architecture, and is one of the most conspicuous of such objects, both by day and when illuminated by night.

Mr. Mullins is well known to FOREST AND STREAM readers as a builder of metal boats; and it is to be said for the Salem establishment that as the Mullins' boats sail every inland sea, so the Mullins' gods and demigods lift themselves against the sky from countless towers and pinnacles throughout the land.

son, etc. The rights of all should be made so plain that there could be no room for controversy. If the people of the towns can be driven out of the streams, and have no rights only through the sufferance of others, then the sooner they know it the better, that they may protect themselves by withdrawing the financial aid which they have so freely given in the past. What the people pay for in common they should be permitted to use in common, without let or hindrance, and the rights of the people should be clearly defined by statute.

Early in April the Commissioner will begin the distribution to the various counties of the State, and this year's output will be as large as any ever made from the institution.

California Trout Waters.

REDLANDS, Cal., April 5.—*Editor Forest and Stream:* The shooting season has closed for all but rabbits, on which there is no law, and which I am told breed all the year round. There are some who shoot rabbits all the time. The dove season opens on July 1. The fish law was out on the first of this month. The mountains are full of tourists and fishermen. J. L. Brown rode up to near the head of Alder Creek on Friday last, which was the opening day, stopping at convenient places to cast line in the limpid ripples. He took twenty-three nice trout and saw a man who had sixty. There is quite a lot of snow in the mountains yet. John saw one mountain quail and the track of a large mountain lion. He rode most of the way on his wheel and on the return trip I think rode all of the way. Most of the fishermen here use earth worms for bait. The trout are usually very small, but they form one of the chief attractions to the army of pleasure-seekers who invade the hills during the term of intense heat and dust in the valleys.

I have been informed that twenty arrests were made on the Sunday preceding the opening of the trout season here, all of which were duly convicted and fined.

REELFOOT.

To Catch the Large Trout or "Bilers."

WE have a law, passed by a most humane and non-sporting Legislature, which prohibits the catching of any trout not exceeding 4in. in length. My hand is full 4in. broad, and since the law was provided I have laid every little trout which came my way across the palm of my hand, and every one of them projected from side to side, so it may be said that this part of the law is in no great danger of violation. But there are natural safeguards thrown around the small trout that protect it better. They are too troublesome to clean and carry home. On our clear mountain streams the fisherman nearly always sees the trout before it takes the hook, and if it is not big enough to make a desirable addition to the day's catch, the hook is drawn out of its reach, much to the little fellow's disgust, I have no doubt, and another ripple or pool is tried.

But there is a time when even 7 or 8in. trout are a drug in the market. For instance, our party has gone back in the mountains for a week's stay, at the forks of Cranberry, and our camp is ten miles by air line from the nearest mountain cabin. If the conditions are favorable the fish are caught in too great quantities to be eaten, and a halt is called and camp life must be endured, lies swapped, novels and back copies of FOREST AND STREAM read, and such other amusements tried as may be indulged in at camp. Not that it takes a small number of mountain trout to do the four or five men and the black cook, who has made it a constant source of pride for about ten seasons not to let a fish go to waste at camp. But a few hours' fishing down the little river or up either one of the forks through the heart of a dense wilderness absolutely free from any of the encroachments of civilization, will result in a basketful of trout which, added to the other lots brought in and all cleaned and sunk in a little pool, will make enough to supply the market for a day or two.

These fish are fried and eaten with warm biscuits, baked in the old-time oven at the camp-fire, bacon, potatoes, onions, butter and coffee. About the second evening a great cry goes up for "bilers." They are looked upon as the delicacy of the trip. The large fish are taken and boiled until they are cooked through without the skin being broken. They are carefully removed to keep them whole, and the same sauce-pan and liquor is used to make the sauce by adding flour and butter mixed in a stiff dough, and lemons squeezed in or vinegar to suit the taste. The sauce should be the consistency of batter, and poured over the fish, which are served at once. If cooked properly, this makes the finest dish in which fish can be eaten, but if messed up the slightest it is the nastiest.

Believing that there is really more enjoyment in catching one good-sized trout from a deep pool than the ninety-and-nine that are to be taken half grown from the ripples, I have paid some attention to the taking of the "bilers" or big bull trout from the deep water. Ordinarily I use flies in fly season, but you may whip the deep blue pools till you are deep blue in the face without getting a big trout to rise. Your big trout will all be caught in shallow water, where they may be lying temporarily. It takes special study to work those big pools, where you know the big trout live in the shadow of the overhanging rocks. They have been "dulled" in dry season, but I never envied the man who caught them that way. Fishing worms are of no use. It is possible to catch one middle-sized fish, but if you persist the minnows will eat up the bait. The most successful plan I have ever pursued was to use crawfish. A handful of these may be secured by turning up the rocks along the shore. On one occasion I was looking for a place to hunt for bait, when I came on a raccoon turning over the stones, looking for crawfish. He got out of my way slowly and stopped within thirty steps and looked at me and remained there until I threw a rock at him. I took up the work where he had left off. After securing a handful I ground them into small bits between two stones and cast a handful of the pieces on the pool. The bait sinks, and I attach a piece of a defunct crawfish the size of a grain of corn to my hook. I have rarely failed to take from the pool several fish by these tactics. With a little care in casting and fishing, if you can fish at all, you should be rewarded under these conditions by seeing your line walk away soon, and striking in at the right time find that you have a fish which will give you some satisfaction to capture.

After a minute or more of acute excitement a big red 12in. trout lies gasping on the strand, and you see by his sharp teeth, which punish your fingers so cruelly when you take him from the hook, that he has attained his full growth. I have caught as high as eight full grown trout from a pool in a quarter of an hour. After this time their biting fury is apt to be over. It is supposed that the abundance of bait scattered broadcast over the water brings on their appetite for death.

But I have never been able to fish the Shumate Hole with success but once. This is the longest, deepest, broadest pool in the river, and the popular belief is that trout live there which can break your tackle all to pieces. I have tried the crawfish racket time and again without results. One fish of ordinary size might be deluded into suicide. I have tried minnows and grasshoppers, and dozens of strange looking grubs from under the bank of rotten logs, but the magic would not work. One whole season I hardened my heart and passed this pool of unknown depth, and wasted no time on it. On the last trip I made there, however, in fishing down the stream with fly I noticed a "spotted minnow," such as is tolerably common in the Greenbrier River, where I fish for bass. I cannot give its name, but it is a little fish about 2in. long, something like a sucker, lies close to the bottom of the stream, has wonderfully tough flesh, and is by far the best bass bait known to me. It was an unusual thing to see it in this trout stream, and I was lucky enough to catch it by cornering it in shallow water. Being near the Shumate Hole, I determined to try it as bait, remembering that I had often caught bass with this minnow when they would take nothing else I had to offer them. I cut the minnow into six baits and I am certain that I was not ten minutes in catching six trout

a foot long. By the time they were on the bank I could not have told the time by my watch I was in such a whirl of excitement. I tried then the ordinary minnow and crawfish, but not another bite did I get from that pool. I resumed my fly-fishing and caught eighty trout before I got back to camp, "big enough to keep," but those six were the pride of the lot.

If I should be so fortunate as to get back there this year, I shall keep my eye skinned for the "spotted minnow," and hope yet to catch an 18in. trout from the Shumate Hole.

ANDREW PRICE.

MARLINTON, W. Va.

Trout Fishing and Trout Fancies.

I HAVE just been reading in the *FOREST AND STREAM* Mr. Fred Mather's Chapter No. 1 on Fresh-Water Angling and brook trout, and was very much interested therein.

I suppose it would be called rank heresy to have the temerity to differ in views with such high authority, but in a few unimportant items I may be pardoned for so doing.

I have been a fly-fisherman from way back, and my dear old Governor before me, anterior to the luxuries of split-bamboos, click reels and silk lines, in fact even jointed rods. My Governor's pet rod was a light flexible bamboo with a lancewood tip; and I as a boy rejoiced in a light spruce that cost many a day's search in the woods; and when we started out, our rods carefully wrapped in cloth to prevent damage, projected beyond the wagon, thereby advertised the fact to the neighbors that "the Squire and that vagabond boy of his were off again 'fishin'"—a pursuit by no means approved by the more serious portion of the rather straight-laced community, who looked upon shooting and fishing as frivolous pursuits, unworthy the attention of respectable citizens. To see a man or boy with a fishing rod (or pole, as we were wont to call them in those days) was to elicit a prophecy that he would "come to no good." But I always noticed that the prejudice did not extend to refusal of a share of the "catch" distributed among the neighbors.

In our county, in New York State, were trout streams galore, but still better ones were in the adjoining county of Delaware, and whenever I observed the Governor cocking his eye up at the clouds, followed by taking down the bamboo and an inspection of the sacred drawer where the tackle was kept, I went out, gave the horse an extra feed, and greased the wagon, dug a can of worms and made things ready for an early start next morning. Our destination usually was a creek appropriately named Trout Creek, about fifteen miles over in Delaware county—a long distance in those days, over primitive roads and steep grades.

Arriving at the creek at about noon, the horse was taken out and secured, and after having lunched the work began. My share of the sport was to carry the fish in a big bag or pocket attached to a belt around my waist, and my fishing was only when the driftwood in some deep hole prevented the use of the fly; then my turn came, and dropping my worm-baited hook down between the logs I landed the big fish of the day, and chuckled when I observed the Governor cast an envious glance at my capture.

About the middle of the afternoon I returned to the wagon, harnessed up and drove down the road along the creek to the country tavern, put up the horse and walked up the creek to meet the Governor and relieve him of his heavy bag. The next morning we fished for a couple of hours and started home with trout enough to supply the whole village; and all this with the simplest tackle—a hair line and home-made flies. Even the flies were an innovation, and the wonder of the country granger, who looked over his rail fence to see the Squire "catching them fools of trout with nothing but a feather." In fact, fly-fishing was hardly known back in the country in those days. The trout, like the people, were unsophisticated. They always seemed to me to be surprised and to say: "Hello! what's this? Let's go for it." And they did. They were not fastidious, not educated, as Mr. Mather claims they are in these days. No such thing existed in those days as tackle stores in villages remote from the city, and our flies were necessarily of home production and limited in variety. The barnyard furnished the feathers and the family work-basket the silk, floss and body material. We contented ourselves with the red hackle from the big red cock, the gray from a speckled hen, the miller from white owl feathers; and there we rested. Our trout were satisfied with that assortment and so were we.

I have fished in many localities from Canada to California, in all the Northern States, and tried all varieties of flies; and from actual experience have settled down to less than a half dozen varieties: (1) The red hackle, with yellow bodies; (2) the same with peacock bodies; (3) the black; (4) the moth miller and (5) a green-bodied fly with black wings.

I have had fly-books with every known variety, and have kept them until the moths reduced them to bare hooks, without a trial except occasionally out of curiosity. For instance, I never have caught a fish of any kind on a red ibis, not even a chub or a dace, which, by the way, afford fine sport in many rivers, as they bite at the fly as readily as trout. In these days, when it is the proper thing to go loaded down with a hundred varieties of flies, patent reels, silk lines, hook extractors and expensive rods, and to indulge in scientific fish lore, an old-school fisherman stands in the background and has nothing to say.

I agree with Mr. Mather that a good reel is a good thing and a poor one an abomination. As for rods, I can get as good and serviceable a rod for four or five dollars as I can wish for. I have one I paid \$25 for, and have followed the market down to \$2, and I see no especial merit in my \$25 over the \$2; in fact I seldom use the more expensive one, as it is a double-action, and I hate it. Neither do I advocate the lightest. No 5oz. rods for me; I want to handle my fish, not he me.

As for lines and leaders, I am partial to short leaders, say 3ft. In regard to lines I occasionally amuse myself going back to my boyhood days and make myself a hair; but my favorite line is the Japanese, made of native grass, strong and light, colored variously. Some years

ago I sent \$5 over to Japan for as many lines as it would purchase. In return I received a bundle of lines of every size, from the finest to those for heavy fishing—enough to set up a tackle store—and notwithstanding the quantity I have given away I have still a stock to last me a lifetime. It is wonderful how strong they are, and how free from decay.

Mr. Mather and myself present the two types of fishermen. He represents the latter-day, scientific, refined, educated disciple of Izaak, and I the old style, conservative, matter-of-fact fisherman; but I claim that when it comes to the plain and primitive versus science, in a test of results I will not be very far behind.

It may be an evidence of conceit to say that I have never yet fished with the scientific fisherman that he was one trout ahead of me.

While I appreciate Mr. Mather's views in general, I have no envious feeling at his superiority in the science of fishing and fisherman's lore. I have read his articles on the Aquarium with a great deal of interest, as I always do all articles from his pen, and if he sets me down pityingly as one of the old foggy "has-beens" I shall not feel the least annoyed; but I would like much to meet him on some good trout stream and test the question of the old and the new school, he to be armed with his Jock Scots, silver doctors, mandarins, etc., against a common brown hackle, and let us test the theory of an advanced intelligence that creates fastidiousness and greater daintiness to tempt the trout to rise only to the semblance to one of these imitations of nothing that lives on the earth or under the earth, or whether the fish has not still remaining some of the characteristics of his grandfathers, that were satisfied with a good old style of brown hackle.

If trout are changing their natures, keeping even with the times, and becoming fastidious, we conservative old fishermen will have to seek the outskirts of civilization or ruin ourselves for outfits corresponding to the popular idea of what constitutes present-day essentials for a trout fisherman. As the alternate I think I should go further, on the principle that I could fare no worse. I think streams may be found where trout are yet unsophisticated and are not educated to glance at the sun before rising to see if the color of the fly is the proper thing for that hour of the day, and where half a dozen varieties of fly will suffice and fill the bill for all hours. The question reminds me of the inquiry of an old friend, who did not shoot, but frequently accompanied me in the boat when duck shooting. Observing one day the different numbers of my cartridges, he said: "What do you do when you see a No. 3 duck coming, and have a No. 4 shot in your gun?" On the same principle, if you observe an educated trout smiling derisively at you, look at your watch and say: "Beg pardon, old chap, for trying to fool you with a 9 o'clock fly at half past. No wonder you won't rise. Excuse me for my stupidity, while I correct the error." The moral of it is: If you are to fish in a stream containing the modern educated trout, my theory of half a dozen varieties of flies will not suffice; you must provide yourself with one for each hour of the day.

It must be this same principle that prevails in the style of costume apparently required for the different sports—one for bicycling, another for golf, another for tennis, etc. How mortifying it must be to be invited to a game of golf when you are in your tennis or bicycle suit; you are debarré, of course. It would be entirely inadmissible. The game could not be played in an unsuitable suit, no more than a young lady could go yachting without being decked in blue, with a broad collar with anchors embroidered in the corners, and a sailor hat. She would sacrifice all prospects of a good time, stay at home, cry her eyes out in vexation, rather than be seen in anything but the swell costume fitting the occasion. And it is getting to be about as bad in case of the fisherman, especially if he lives in the city, and is told he must be outfitted to suit the fastidiousness of the present-day trout—not omitting a book of flies of every hue of the rainbow, that would drive an old style of trout daft and make him fall back on worms for the remainder of his life.

SAN FRANCISCO.

The Buffalo Fish.

IN the Journal of the Rev. John Ettwein, the Moravian preacher, who conducted a congregation of his people from Wyalusing on the upper Susquehanna to the Beaver River in the western part of Pennsylvania, in the summer of the year 1772, recently published in "Notes and Queries" in the Harrisburg Telegraph, we have some notices of the natural history of the region through which they passed in early times that are extremely interesting. For example, on July 25 his party encamped near the Mahoning, a tributary of the Allegheny, likely in what is now Armstrong county, where they remained over Sunday. "At this place," says Ettwein, "enough fish were caught to supply the entire camp—large pike and salmon, but especially a large species unknown to us all, resembling the sheephead, in these parts called 'buffalo fish.' In place of a skull they have two small white stones lying toward each other. The mouth resembles that of a sucker, but without teeth; instead in the throat it has two pieces of bone fitting one on the other, in the form of a large shoemaker's pincers, with which it crushes the mussels, its proper food. The meat is better than rockfish, and there are no fins."

In the "Food Fishes of Pennsylvania," the State Report of the Fish Commissioners, 1892, I find described what is called the "buffalo fish," but I cannot identify it with the Mahoning fish, as described by Ettwein. If there ever was a fish in these parts answering to Ettwein's description, I should think it has long since become extinct.

In the same connection he says, "We also took an unknown species of tortoise, as large as a goose—with a long neck, pointed head, and eyes like a dove. The shell is hard above only along the back, and below in the middle, otherwise all around soft and liver-colored." This description of a tortoise, "as large as a goose," reminds us of Dr. Johnson's famous description of a giraffe: "As big as an elephant, but not so thick." However, this strange tortoise, with "eyes like a dove," seems to have accompanied its queer cotemporary, Ett-

wein's "buffalo fish," into the shadowy domain of departed things, for quite sure I am that no such creature now inhabits the waters of the Mahoning.

Game at that time in central Pennsylvania was fairly abundant, as the party in the course of their journey, which extended through a period of about two months, killed three bears and one hundred and fifty deer. Rattlesnakes were greatly in evidence; "I know," says Ettwein, "that upward of fifty were killed." These unwelcome customers invaded the camp itself, sometimes basking between the fires after the travelers had all lain down to sleep. Yet no one was injured by them.

T. J. CHAPMAN.

PITTSBURG, Pa.

Shad Taken on the Hook.

WASHINGTON, D. C., March 14.—I have had considerable discussion as to whether shad could be caught with a hook. If you will answer this, naming the bait used, if any, in your next edition, I will deem it quite a favor.

S. H. M.

[A Washington correspondent wrote us a few years ago, under date of May 2:

"While fishing with angle worm for white perch, about two miles above this city, in the Potomac River, we caught two large roe shad. My little daughter Mabel caught one which weighed 3½lbs.; the one I caught weighed over 4½lbs. They were caught fairly in the mouth as though they had taken the bait. I have fished on this river for twenty years or more, and never before had a like experience, nor can I find any one who has had. I have always understood that shad could not take a bait of any kind, and when they come up stream to spawn they do not feed, as their stomachs are always found empty."

Shad do not come into rivers to feed, hence they seldom notice any kind of bait; but in a few localities, notably Washington, D. C., and Holyoke, Mass., they have been captured with small and light-colored flies, like white-miller or white and ibis, dressed on hooks corresponding in size with No. 6 or 7 Sproat. In his report on the fishes of Lake Ontario, Dr. Hugh M. Smith, of the United States Fish Commission, notes the taking of shad with grasshopper bait in the St. Lawrence. The fish were supposed to have come from a planting of shad in Lake Ontario waters. He says: "In August, 1881, Mr. H. L. Matheson, of Oswego, N. Y., was fishing at that place for black bass. As an experiment he baited his hook with a grasshopper and cast his line from the shore of the island into the current, made somewhat muddy by a strong westerly wind. The bait was promptly taken, and to his great surprise a 3lb. shad was landed. More grasshoppers were secured, and fifteen shad, weighing from 2½ to 3lbs., were taken in a few hours. On succeeding days, six, three and two fish respectively were caught. Several other parties took one or two fish each in the same way." Mr. J. V. Sharp reported in these columns that he had seen shad take the fly in the James River, Va., the fly of medium size and bright color; on one occasion five roe shad were taken in an hour.]

Newfound Lake.

NEWFOUND LAKE, Bristol, N. H., April 25.—The ice went out of the lake April 17. The past week has been mostly rainy and cloudy weather, but the salmon fishing has been excellent considering the temperature of the water and high winds.

Fishermen from Boston have carried home a number of salmon averaging 8lbs. each, and residents here have made good catches. A. Doloff, of Bristol, caught five the day after the ice went out. April 23 Frank Kirk at sundown hooked a large salmon, which refused the net for an hour; it was quite dark when the fish was finally landed in the boat; the weight was over 15lbs., the best of the season thus far.

There has been the usual number of large ones (?) that got away, but the losers are consoled with "It is better to have fished and lost than never to have fished at all." The lake trout fishing has not been quite so good as usual, only eight trout being taken as yet at this end of the lake.

LANDLOCKED SALMON HOUSE.

A Possible Interruption of Mr. Mather's Fishing Papers.

BROOKLYN, N. Y., April 23.—*Editor Forest and Stream:* I go to Albany to-morrow night to offer my services for my country. If they are accepted, I will remain in Albany until the regiment being raised by Col. J. Meridith Read leaves for the front. I once said: "No man will ever shoot at me again with my consent;" but now that the war drums are beating, and my country needs men who have been under fire, I cannot remain idle and see the boys go off without wanting to go also. If for any reason I cannot go, I will sadly resume my pen and tell how little I know of fishing. A week will decide it.

FRED MATHER.

Adirondack Trout.

SARANAC LAKE, N. Y., April 25.—The fishing has been very good so far. On Thursday, April 21, a gentleman from New York, with Lowell Brown as guide, caught four nice lake trout; the largest one weighed 11½lbs.; they were caught in Lake Cobby, a small lake about three-quarters of a mile from Saranac Lake village. On Friday, April 22, Mr. Pemberton Pleasant caught in Lake McKenzie, a small lake about two miles from this village, a brook trout measuring 17½in. in length. April 22 a prominent lawyer from New York caught in Little Tupper Lake sixteen brook trout, weighing from ¾lb. to 3lbs.; the average was 1½lbs.; these trout were caught by trolling.

E. E. SUMNER.

Pennsylvania Trout.

THORNHURST, Pa., April 23.—Trout fishing is excellent this season, and trout streams are in fine condition. Mr. J. G. Bailus caught one in Lehigh River below Thornhurst, weight 2lbs., length 21in. Large catches were made in Delaware Lake on April 15 and 16 by George Waddell, of Wilkes-Barre, and others. Mr. Stark, of Pittston, caught one in the lake, 16½in., weight 1½lbs.

A. E. P.

The Leetly Fishyman's Boy.

Dat leetly fishymans was be Pierre La Roche. He was mek dat leetly song in hees head of it, an' M'sieu' Mumpsin say he was gat 'banot so much rhym' as dey was raisin in it. Ah' do' know what dat mean, prob'ly. M'sieu' Mumpsin was wrote on de papier jus' sem Pierre was spoke it, an' de bes' was he mak' b'lieve it was true story, happen in Canada.—ANTOINE BISSETTE.

Mah fader she keel in de Papineau war;
Mah mudder come dead for so sorry;
Bose lef' me for be poor awfultin boy,
'E a'n't know where he live to-morry.

Mah onc' he tol' me come live long to he.
Mah ha'nt say he be fadder and mudder,
Mais always Ah'll took de bes' Ah'll gat, me;
Ah'll took dat w'en Ah'll can't get no odder.

Mah onc' hugly, for lick me lak t'under,
Mah ha'nt mak' gre't nowze wid his mouse,
'F you'll heard it, den you'll prob'ly was wonder
How many chill'n dey gat in dat house.

One tam dey tol' it Ah'll might gone feeshin'—
'Ta'n't often Ah'll get it chance for some play;
But if Ah can had de bes' t'ing for weeshin'.
Ah'll a'n't want better as had it dat way.

Ah'll leetly small feller, 'bout t'ree, four foot hole,
Jus' hable for pull up big angly worm;
But two tree Ah'll chop for mak'-it two pole,
Was mos' clear off one corner de farm.

Den Ah go on de bank of de river,
An' lucky mah hook so Ah'll can't spit more,
An' more as two nacre Ah'll kiver,
Wid all kan' o' feesh Ah'll a'n't see beffore.

Wid peck'ril, bass, parch, sheep'head an' dore,
Ah'll poun' de groun' fas' as two man's trash,
An' bull-plug plenty sam' in dat story
Some peop' was tol' 'bout dat Kankakee ma'sh.

Mah onc', mah ha'nt, dey bosc was get grosse riche,
For sol' w'at Ah'll ketch dat day, Ah s'pose;
An' heat so much all kan' o' feesh
De bone stick out so he can't pull his close.

An' dey come dead an' go, Ah do' know w'ere,
An' lef' de money an' de farm behin';
An' Ah go feeshin', me, an' took good care,
Because w'at dey lef' all was be mine.

The Kennel.

Three Good Dog Stories.

WE were speaking of the power possessed by some animals of communicating their ideas one to another, and my friend kindly furnished me with two or three stories to illustrate the point. He said: James Cumming was fishing a stream near Coupar, and was much annoyed by a small terrier, which followed him along the path barking, till he turned and "flicked" the dog over the nose with his fishing rod, when the dog at once ran off. My friend went on with his fishing, and forgot the incident till he noticed the small dog returning, trotting by the side of a large retriever, who, without any growling or preliminaries, quietly bit Cumming's heel, and in the same quiet and dignified manner at once retired, honor having been satisfied.

In the district of Rangitikei, New Zealand, where I lived for some years, hares were very plentiful, and coursing was the sport indulged in by everybody, the result being that greyhounds swarmed in the townships; and while their owners were busy, they were inclined to suffer from ennui, and thus it happened that some fifteen to twenty hounds would often trot out from the village, quite unattended, about a quarter of a mile, to a paddock opposite my house, and there they would mass up in one corner close to the gate. Presently one of the number would dash out from the mob toward the middle of the field, and when it had got some 50 to 70yds. start, would begin to "double" and twist exactly as a hare would do when hard pressed. The pack would at once commence the chase, while the "hare" dog dodged and turned at full speed, till at last he was "collared" and pulled down, when the panting pack would return to the rendezvous at the gate, and after a brief "blow" another dog would break away and assume the role of "hare." This sport I have seen carried on for nearly an hour at a stretch, perfectly spontaneous on the part of the dogs.

Another curious story was told me by Dr. Frank Wallace McKenzie, of Wellington, N. Z., whose father owned a run in Otago, which was much overrun by rabbits. In order to keep the rabbits in check, if possible, a non-descript pack of dogs was kept at the station to hunt rabbits for their living. The pack was composed of half-bred greyhounds and collies chiefly, and they were in the habit of going out every morning quite by themselves and hunting all day, returning in the evening to the station. A very small Scotch terrier always accompanied these expeditions, his small body allowing him to take the part of a ferret, and turn the rabbits out of their burrows. This dog, therefore, became necessary to others if they wanted really good sport; but there were times—as this dog grew old—when the comforts of the kitchen fire outweighed the joyous excitement of digging rabbits out of the snow, and as he was a privileged individual, and his daily bread did not depend entirely upon the slaughter of the chase, he would sometimes absent himself from the "meet," but the other dogs knew better than to start without him, so a deputation would return to the kitchen to ask him to "reconsider his position," and being armed with wider powers of persuasion than most deputations, when this one was met with snarls and growls, it set upon the object of its prayers, and dragged him out of the place. At once he was surrounded by the pack, and hurried off to the hunting ground in no very gentle manner. Once there, the "spirit of the chase" would come over him, and his stiffness wear off, but the same performance would probably

have to be gone through next morning. I have often wondered what the other dogs did when this terrier died.—Our Dogs.

POINTS AND FLUSHES.

THE American Kennel Club Stud Book for 1897, Vol. XIV., is now ready for delivery. In binding, printing, etc., the volume is up to the usual excellent standard of the A. K. C. books. It contains pedigrees from Nos. 42,590 to 46,327; a list of the officers, active members and associate members of the A. K. C., advisory committee, a record of the bench show and field trial winnings of 1897, cancellations, kennel names, prefixes and affixes, re-registrations, standing committees, a list of the bench shows and judges of 1897 and bench show winnings of the winners of 1897. The volume covers the records from Jan. 1 to Dec. 31, 1897. It can be obtained of A. P. Vredenburg, Secretary American Kennel Club, 55 Liberty street, New York.

Mr. C. E. Buckle, of the Charlottesville Field Trial Kennels, writes us that he leaves for England on the 23d inst., returning in time for the summer training on chickens and the Manitoba field trials. Capt. C. E. McMurdo, Charlottesville, Va., will attend to the business affairs of the kennel in the meantime.

Yachting.

THE steam-yacht Free Lance has been presented to the United States Government by her owner, F. Augustus Schermerhorn, of New York. She was designed by A. Cary Smith and built by the Crescent Shipyard, Lewis Nixon, in 1895. Her dimensions are: Over all, 137ft.; l.w.l., 109ft.; beam, 20ft.; depth, 11ft. 7in.; draft, 8ft. She is of steel, schooner rigged, and carried triple expansion engines. Her speed will make her a very useful craft.

SINCE last week the Board on Auxiliary Cruisers has recommended the purchase of ten additional light draft vessels, yachts and tugs, and a number of yachts have been inspected. Those purchased are Thespia, Viking, Restless and Corsair, Penelope and Aileen. The work of converting them goes on rapidly at the Brooklyn Navy Yard. The Scorpion was finished last week and sailed for the South. When she left the yard, with only her foremast standing, and that cut off at the hounds, with her bowsprit sawed off plumb with the figurehead, with topsides, deck houses, spars and boats of one dull shade, a dark lead color, and with two 5in. guns forward and two aft, with a half dozen rapid-fire guns in addition, no one would have recognized her as the shapely Sovereign. The names of the yachts thus far completed are:

Original.	New.	Commander.
Mayflower,	Mayflower,	M. R. S. Mackenzie,
Hermione,	Hawk,	J. Hood,
Columbia,	Wasp,	A. Ward,
Alicia,	Hornet,	J. M. Helm,
Almy,	Eagle,	W. H. Southerland,
Sovereign,	Scorpion,	Adolph Marix,
Josephine,	Vixen,	Alex Sharp, Jr.

COM. MORGAN, of the New York Y. C., has given orders that all the stations of the club be put in commission at once, that all telephonic and telegraphic facilities at them be perfected, and that they be placed at the disposal of the Government. These stations are placed as follows: No. 1—Bay Ridge, N. Y. No. 2—New York, Twenty-sixth street, East River. No. 3—Whitestone, L. I. No. 4—New London. No. 5—Shelter Island. No. 6—Newport. No. 7—Vineyard Haven. No. 8—Atlantic Highlands. No. 9—Ardsley-on-Hudson. No. 10—Glen Cove, L. I.

THE trustees of the Larchmont Y. C. have extended to Lieut.-Commander Field, United States Navy, in command of the Third Coast Defense District, the full use of all the facilities of the club house and station, including such accommodation as he may require in the main house and other buildings; and the use for any purpose of the club floats and landing stages, launches, telegraph instruments, and long-distance telephones. The trustees of the club further announce that in the event of actual hostilities between the United States and any other country during the coming yachting season the events already scheduled, including regattas and the festivities of race week, will be omitted.

ON April 25 the following orders were issued by Major H. H. Adams, in charge of the fortifications of New York Harbor:

Submarine mines having been placed in position in connection with the defenses of New York, the following regulations for safe navigation by friendly vessels and for the protection of the defenses are hereby established by authority of the Secretary of War:

1. No vessels will be allowed to pass Sandy Hook or the Narrows between the hours of sunset and sunrise. During this interval vessels must not approach within three miles of Coney Island, Gedney's Channel, Sandy Hook or the Narrows.
2. Patrol boats will be stationed above and below the defenses. These boats are authorized to stop vessels to inquire into their character, or to instruct them how to pass through the mine fields. The orders of the patrol boats must be strictly observed.
3. Sailing vessels and all small vessels drawing 3ft. or less can safely pass through any part of the channels during the daytime.
4. Steam vessels must pass at slow speed through a special channel, which will be marked by buoys.
5. Vessels are warned that if they disregard these regulations they will expose themselves to serious damage, and will be liable to be fired on by the batteries.

With Coal to Callao.

E. J. Brady in the Sydney Bulletin.

THEY slewed her in to dump her load,
And cleaned her aft and fore;
They turned her out to take the road
She'd taken oft before;
All geared aloft, all free aloft, all tight and trim below,
To take the road, and make the road, the road to Callao.

He kissed the girl ashore he'd found,
And said: "You'll never miss me;
You won't start weepin' if I'm drowned,
But kiss me, sweetheart, kiss me!
'Tis miles to go, long miles to go, eight thousand miles or so,
With seas about and seas abeam, and coal to Callao!"

Around his neck she twined her arms,
"Luck speed you, Jack!" cried she,
"And from the sea and all its harms
Come back some day to me.
I'll wait for you, I'll watch for you, though well, dear lad, I know
There's other girls and fairer girls—the girls of Callao."

He took his sheath knife from his belt
And said, "'Fore God, my beauty,
Yon sun from out the sky may melt,
But I won't turn from duty.
This lock o' yours, this curl o' yours, goes with me where I go—
Across the world, around the world, to hell—or Callao!"

Her eyes were like two shining stars
That sparkle through the rain.
All sail was bent upon the spars,
He kissed his love again.
'Twas "Come aboard!" and "All aboard, and let her shore lines go,
And take the road, and make the road—the road to Callao."

They swung across Newcastle bar,
And sou' by east away;
They saw the Cross hung out afar
Below the Milky Way;
They saw the land go down a-lee, and heard the rollers go
Across the road, along the road, the road to Callao.

The sun came up on sixty days
And set on sixty nights;
Beneath the star-lit heaven's maze
She kept her course to rights,
And while the cool winds kissed her wings, as white as driven snow,
She drove the dancing spray ahead—laid down for Callao.

They heaved her log for sixty days,
But on the sixty-first
Her greasy cargo went ablaze,
And then the hatches burst!
'Twas "Man the pumps! All hands to pumps; and curse her as ye go;
A broken ship, a burning ship, ten days from Callao!"

They tied the air pumps throat and neck
With canvas triplefold,
Then passed the wet hose down the deck
To flood her flaming hold;
All cursing hard, all praying Christ to heed them in their woe,
To bring their seared and sinful souls alive to Callao.

The yellow smoke that trailed a-lee,
It clouded in her wake;
The steam that tore the lashings free
Hisssed like a scalded snake;
And blinded, beaten, driven back, they watched the fire fiend grow,
And cursed the hour and damned the day they sailed for Callao.

Death's angel bared his flaming sword
And smote her hip and thigh;
Her foremast splintered by the board
Like twig three seasons dry;
But when the mainmast crashed to port they sweltered in their woe,
To see her useless boats drift by—ten days to Callao.

The prisoned gas shot out aflame
And licked her mizen yard;
Her broken bones against her frame
Jammed home again and jarred;
They flung the hurried scrawl adrift, to let their fellows know
What fate was theirs who'd fought with death, bound out for Callao.

She lurched abeam until the brine
Began to lap her rail,
Till doom and she with level twine
Were reeving neck and tail.
They dragged the rum keg aft at that, and let the liquor flow,
To die the death they had to die, ten days from Callao.

But when she gulped the water in,
And when her stern heaved clear,
With God's good grace to shrive their sin,
They rose a British cheer—
Then choked like men who pay the debt all men to nature owe,
On either road, on every road, 'tween this and Callao.

They're swinging coal aboard the Star
'Longside Newcastle quay;
And out across Newcastle bar
Far spreads the lonely sea;
And Jack's fond lass has found a friend to love her e'er he go
Along the road, the level road, the road to Callao.

Long Island Sound Y. R. A.

A MEETING of the executive committee of the Sound Y. R. A. was held on April 18 at the Seawanhaka C. Y. C. house, all the members being present, as follows: C. T. Pierce, Riverside Y. C.; O. E. Cromwell, Seawanhaka Y. C.; E. Burton Hart, Jr., Huguenot Y. C.; W. P. Stephens, Corinthian Fleet; O. H. Chellborg, Knickerbocker Y. C.; F. Bowne Jones, Indian Harbor Y. C.; and Charles P. Tower, New Rochelle Y. C.

The committee organized for the year with Mr. Cromwell again as chairman and Mr. Chas. P. Tower as secretary. Mr. F. B. Jones, who has held the office of secretary since the organization of the Association, declined a re-election. A vote of thanks for the work he had done during his incumbency was tendered. The following amendment was adopted, the wording having been delegated to the executive committee—Rule II., Section 4:

The racing measurement of a yacht launched after Nov. 1, 1896, shall be assumed to be the maximum limit of her class; or any yacht the measurement of which has been increased to such an extent as to place her in a class above that in which she sailed prior to that date (Nov. 1, 1896) shall assume the maximum length of that class in which she will sail.

At the annual meeting a rearrangement of the starting signals was decided on, the final details being left to the committee. The arrangement adopted at the meeting was as follows:

- Red ball—For all schooners.
- White ball—First class, 70, 60 and 51ft. classes of sloops, cutters and yawls.
- Blue ball—43, 36 and 30ft. classes of sloops, cutters and yawls.
- Two red balls—25, 20 and 15ft. classes of cabin and open sloops.
- Two white balls—30 and 25ft. classes of cabin cats.

Two blue balls—25, 20 and 15ft. open cats.

Red and white balls, white and blue balls, and red and blue balls—For special classes.

Several changes of date were announced. The opening regatta on the Sound of the Huguenot Y. C. will be on May 21 instead of May 14; the New Rochelle Y. C. will take May 28 instead of May 21; and the Seawanhaka C. Y. C. may exchange with the Douglaston Y. C., taking June 25 in place of June 29, in order to work in its cruise to New London.

The committee decided to print an official list of yachts, owners, racing numbers, etc., in pamphlet form. It was decided that the blanket entry should be used through the season. Secretary Tower's address is New Rochelle, N. Y.

Mayflower.

Steam Yacht—Torpedo Gunboat.

WE are indebted to the courtesy of the New York Times for the accompanying illustration and description:

The Mayflower, the yacht that the late Ogden Goelet had built on the Clyde, and on which he spent thousands of dollars and devoted much time in order to make her the finest floating palace in these waters, is now a torpedo gunboat. Her handsome interior fittings, artistic decorations, which were done by the best decorators of France and Italy, and all her luxurious furniture have been taken out of the yacht, and in their places now are torpedoes, rapid-fire guns of different caliber, powder and shot. The yacht that was the pride of her builders, the pride of her designer, the pride of her owner, and the pride of the New York Yacht Club, in whose fleet she was enrolled, is now a fighting machine of no mean power.

The Mayflower cost about \$800,000 to build, furnish and decorate, and after the death of Mr. Goelet it was decided by the executors of the estate that the yacht should be sold. At one time it was reported that the King of the Belgians had purchased her, but just when it was expected that she would leave for Europe the yacht was turned over to the United States Government to form one of the auxiliary fleet. It is said that \$500,000 was paid for the boat, and Mrs. Goelet was allowed to remove all the furniture and as many of the decorations as could be taken away.

The Mayflower was designed by George L. Watson, and was built by G. & J. Thompson, the builders of the steamers Paris and New York. Her tonnage is 1,800, and her dimensions are 275ft. on the waterline, 32ft. over all, 36ft. 6in. beam, and 30ft. depth. She is fitted with twin screws, one under each quarter, which are driven by double and independent sets of triple-expansion engines. These engines have four cylinders each, which are 22½, 38, 40 and 40in. in diameter respectively, with 27in. stroke of piston. Two single-ended boilers furnish the steam.

The boat is plated up to what is known as the hurricane deck. Rolling chocks nearly the whole length of the boat from the turn of the bilge are fitted on both sides. They are about 18in. deep.

The different decks are the lower or cabin deck, the main deck, the bridge deck and the deck of the topgallant forecastle. The bridge deck does not reach as far aft as the counter, and the plating stops short with it. At the fore end of the bridge deck there is a break, which leaves an open space between the bridge deck and the topgallant forecastle. But this well in the main deck does not reach down to the lower deck. A half deck prevents any quantity of water being shipped into this break, and under the half-deck space has been found for trunk rooms and other impedimenta. Since the Mayflower has been in the yard this break in the plating has been filled in, and the boat has been further strengthened by having nickel-steel plates 6ft. in width riveted on each side. These plates cover the vital parts of the boat, and extend about 2ft. below the waterline.

The engines and machinery are amidships. As a yacht the interior arrangements of the boat were very elaborate. On the main deck were two staterooms with dressing rooms and bath room attached, which were for Mr. and Mrs. Goelet. These were forward of the machinery. There was also a large boudoir. On the starboard side of the engine and boiler casings were three smaller staterooms, the armory and the smoking room. On the port side were the laundry, galley, pantry and other accommodations. The dining cabin was amidships, occupying the whole breadth of the yacht. On the starboard side was the reception room. The reception room was quite a feature, and opened upon a landing in the gangway by a door in the yacht's side. By the gangway visitors arriving by boats or launches reached the reception room without having to go on deck.

Immediately abaft the reception room was the drawing room, extending the whole width of the yacht. Aft the drawing room was the library, having a passage or alley each side on the main deck, inside the bulwarks. The cabin deck forward of the machinery accommodated one large stateroom with bath room and rooms for valets and maids. Aft the machinery were six large staterooms and a maid's room. At the extreme after end, with separate entrance from the deck, were the rooms of the men servants. On the same deck, amidships, between the engine and boiler casings, were the quarters of the firemen, also steward's stores; here also were situated the refrigerating chambers.

Forward of the private cabins were the quarters of the ship's officers and of the petty officers. Under the cabin deck forward were the storerooms for the boatswains, stewards, and also for the crew. Under the topgallant forecastle deck is the windlass, the galley for the crew, the quartermaster's rooms, the laundry, the lamp room and the lavatories. The bridge deck was occupied with the forward deckhouse, in which were the deck boudoir, chart room and vestibule. Aft, it accommodated a large smoking room and vestibule. The navigating bridge is over the chart room. The yacht's armament consisted of six Hotchkiss guns on the bridge deck and on the topgallant forecastle. She was lighted throughout with electricity, with arrangements for decorating the masts and spars on special occasions. On the bridge deck forward are two searchlights. She carried nine small boats, including a 32ft. steam launch, two large lifeboats, three dinghys, cutter, gig and electric launch.

Now all this luxury is changed. Several of the state-rooms have been sacrificed, particularly those on each side of the engine space. On the lower deck, aft of the engine, room has had to be made for the torpedo tubes, which have been placed on each side of the boat. Other rooms on this deck have been transformed into magazines, and additional bunkers have been put in. Those rooms that are left will be fitted up for the officers of the vessel. The drawing room will be the officers' mess room. The captain will occupy Mr. Goelet's room, and the library will be his cabin. The officers will divide the other rooms among them. The tars will occupy the quarters that were intended for the yacht's sailors, and the petty officers will have the rooms that were formerly used by the yacht's officers.

The boat's armament is a powerful one for such a vessel. In addition to the torpedoes she will have when finished two 6in. rapid-fire guns on the main deck for-

tight floor. The yacht is handsomely finished below, in pine and mahogany, and fitted with ice chest, etc. Considering her canoe shape, the most has been made of the internal room. She will carry a good sail spread, there being no limit under the rules.

The second yacht, which will be named Cartoon, is for the 25ft. l.w.l. class of the Massachusetts Y. R. A., one of the fine wholesome family cruisers produced by the plain l.w.l. rule, as opposed to the racing machines produced by the Seawanhaka rule. She is designed to comply strictly with the new definition of a cabin yacht of the Massachusetts Y. R. A. She is 43ft. over all, 25ft. l.w.l., 10ft. beam, 12½in. draft of hull, and with her fin will probably draw over 7ft. The model is a combination of the extreme features of the 15-footer El Heirie and the 20-footers Skate and Shark, carried into a larger class. The sheer plan and sections are much like El Heirie, there being the minimum freeboard called for

MAYFLOWER, STEAM YACHT, DESIGNED BY G. L. WATSON, 1896.

In dock at the Brooklyn Navy Yard, April, 1898.

By courtesy of the New York Times.

ward and two 5in. rapid-fire guns on the same deck aft. On the bridge deck twelve more smaller rapid-fire guns have been mounted; so the new Mayflower will be quite an ugly customer to tackle.

The original rig of the boat was brigantine, but the topmasts have been taken out, and now she carries two pole masts.

The Two Parker Yachts.

THE two yachts ordered by Mr. John D. Parker and his brother of Gardner & Cox are now well advanced at B. F. Wood's yard, City Island, the larger being ready for launching. She is a keel boat, for the 30ft. class of the Y. R. A. of Massachusetts, and is similar in type to Norota and Syce, practically a fin-keel. Her dimensions are over all 46ft., l.w.l. 30ft., beam 9ft. 6in., and draft 7ft. 5in. She is a beautifully moulded craft, one of the handsomest that the firm has yet turned out; the S section is much cut away, practically into a fin, as mentioned above, giving a canoe-like body; but the fore and aft and section lines alike, though round and full, are beautifully fair. The keel contour is similar to Syce, very much cut away forward and aft, with a slightly balanced rudder on a post that is nearly vertical. The lead keel is a short, compact lump of over three tons, flat on the bottom, and with nearly vertical sides. Like all of the type, the yacht gives a minimum of accommodation on a maximum of draft; at the same time, by the use of a rather high house, she has a cabin that will accommodate four very comfortably, with room for two forward. In looking over her we are reminded of Mr. Gardner's first attempt in a keel boat of the same l.w.l., the 30-footer Kathleen, as extreme in the way of heavy displacement as this yacht is in the opposite direction. Kathleen, with a flush deck and low skylight, had good headroom, a roomy main cabin, ladies' cabin, and almost unlimited locker and stowage room.

The construction is excellent both in design and execution, and Mr. Wood has done work that will stand comparison with any we have yet seen. The frames and deck beams in the middle body are of angle steel, well strapped diagonally, the end frames being of bent oak. The wales are of oak, with moulding worked solid, and there are oak shelves in the wake of the wood frames and beams in the ends; but there is no shelf of clamp amidships, only the steel frames and beams united by deep gussets. The main and runner chain-plates are carried on steel plates riveted to the frames. The planking is single, fastened with bronze stove bolts. The planksheer and transom are of mahogany, the latter handsomely worked from a heavy plank, and the deck, laid straight fore and aft, is a fine piece of work. The cabin house is 15in. high, with 6in. crown to top, all of mahogany. There is a small cockpit, with water-

by the rule, 21in., with no sheer, while the keel is in one piece from stemhead to the flat square transom. The deck plan is worse than in El Heirie, more like Al Anka and Skate, a semicircle at the bow. The "cabin house" is much the shape of a mandolin, inverted on the deck, the crown being excessive. When the crew of six, as allowed by the rules, are compelled to give a practical test of the ability of the cabin top to support their entire weight, they will probably have to be glued or lashed fast, or they will slide off. The hull will be of very light construction, double skin with cedar inside and mahogany outside, the same elaborate bracing and strapping being employed as in the Seawanhaka 20-footers. The rudder will be narrow and very deep, as in Shark, and the fin will be a bronze casting with lead bulb, also very narrow and deep. The 25ft. class at present includes some very serviceable boats of the Cape type, fast enough for racing, but also used for general yachting service. Just what this new family cruiser will do against them remains to be seen; but with the liberal crew allowance, six, giving enough shifting ballast in addition to the fin to sail her at a rank angle, she should at least be fast, whatever bad qualities she may develop. The result of her racing with the old and new boats of the 25ft. class promises to be highly interesting and instructive.

The North American Y. R. U.

THE meeting of the Council of the North American Y. R. U. will take place on April 30 in New York, and the Council will then recommend a rule of measurement for adoption in the fall. The following has been sent out by Secretary Jones to various designers:

"Dear Sir: I am instructed by the Council of the N. A. Y. R. U. to invite an expression of opinion from the leading naval architects of this country on the advisability of the Union recommending for adoption by the yacht clubs of the United States and Canada the rules of measurement at present in use by the British Yacht Racing Association, the formula being as follows:

$$\text{Lineal Rating} = \frac{\text{L.W.L.} + \text{Beam} + .75 \text{ Girth} + .50 \text{ S.A.}}{2}$$

"If in your opinion the adoption of this exact rule is not desirable, would you recommend a rule using the same factors with different values? Also, how, in your opinion, should the centerboard be measured in estimating girth, so that yachts of the centerboard type would not be at a disadvantage in competing with keel yachts. A meeting of the Council will be held on April 30 to act upon this matter, and I would be pleased to hear from you before that time. I inclose herewith the report of the committee appointed to confer with the Y. R. A. Yours respectfully,

"(Signed)

FRANK BOWNE JONES, Sec'y."

ARIEL, FRENCH TORPEDO BOAT.

From *Le Yacht*.

The French Torpedo Boat Ariel.

THE spirited picture which we reproduce from *Le Yacht* represents one of the later French torpedo boats of the sea-going type, a comparatively new vessel from the Normand works at Havre, which was sunk on the night of March 24 by the French cruiser the *Friant*, while both were taking part in the practice maneuvers off Brest, France. The *Ariel*, under command of Lieut. Benoit, had exchanged signals with the *Friant* about 1 A. M., both running without lights, in a smooth sea, but a very dark night. A short time after, the *Friant* running about 10 knots and the *Ariel* 13 to 14, the latter crossed the course of the former, and though the *Friant* was instantly sent astern at full speed as soon as the torpedo boat was discovered, it was too late to avoid a collision. The *Ariel* was struck well forward, in the officers' cabin, one of the second assistant engineers, who was asleep in his berth, narrowly escaping a blow that would have cost him his feet and legs. The *Ariel* was cleared and hauled alongside the *Friant*, her crew boarding the latter; then she was taken in tow, but she quickly settled by the head and disappeared in 30 fathoms of water, some 10 miles off shore. She had proved a very successful boat, making 26 knots on her official trial, and could be depended on for 22 to 23 knots in service.

Hermione.

HERMIONE, steam yacht, was one of the first of the pleasure fleet purchased by the United States Government a few weeks since. She was designed by G. L. Watson and built by Fleming & Ferguson, Paisley, Scotland, for Messrs. R. G. & J. A. Allan, in 1891. She was brought to this country under charter by Robert Goellet in 1895, and in the following year was purchased by the late Henry L. Pierce, of Boston, by whose estate she has just been sold. She is 154ft. between perpendiculars, 145ft. l.w.l., 22ft. 8in. beam, and 13ft. depth, her tonnage being 360 T. M. She has quadruple expansion engines, 15, 23, 30 and 45in. by 30in. She is a very handsome and shipshape craft, and well fitted and finished. We are indebted to *Le Yacht* for the illustration.

Model Yachting.

LIKE their fellows in the larger branch of the sport, the model yachtsmen have of late been working toward union and combined effort, and with such good results that after correspondence and work by committees of the different clubs a meeting was held in February, at which the following constitution was adopted:

NAME.

1. The name of this organization shall be the Model Yacht Racing Union of North America.

OBJECTS.

2. The objects of the Union shall be to encourage and stimulate model yacht designing, sailing and racing in North America.

ORGANIZATION.

3. All recognized model or miniature yacht clubs in good standing, composed of members of lawful age, having sailing stations in North America, shall be entitled to representation in the Union.

REPRESENTATION.

4. Each club shall be represented in the Union by three delegates, one of whom shall be the commodore of the club. The other two delegates shall be selected advisedly from the regatta committee.

JURISDICTION.

5. The powers of the Union shall be advisory, and no club shall be bound by the action of the Union until two-thirds of the clubs composing the Union have ratified such action.

MANAGEMENT.

6. The affairs of the Union shall be managed by a council of seven representatives, who shall be elected annually by the Union at its annual meeting, and who shall have the power to fill vacancies in their number. Not more than two representatives from the same club shall be eligible for election to the council.

DUTIES OF THE COUNCIL.

7. It shall be the duty of the council to pass upon the eligibility of clubs to representation in the Union, to appoint special officers and committees, to frame racing rules and arrange dates for union racing events for adoption by the Union; to determine and settle all questions and disputes between members of the Union re-

lating to model yachting which may be referred to them for decision, which decision shall be final, and to take such steps as they may consider necessary and expedient to carry into effect the objects of the Union.

The council shall elect a chairman, secretary, treasurer and statistician.

MEETINGS.

8. The annual meeting of the Union shall be held in New York on the evening of the Friday immediately following the second Monday in April. The fall meeting shall be held on the second Friday evening in November.

The council shall call special meeting of the Union upon the written request of the representatives of two clubs.

Four representatives, representing two clubs, shall constitute a quorum at any meeting of the Union.

The council shall appoint such times and places for its meetings as they consider expedient and four members shall constitute a quorum at any such meeting.

ASSESSMENTS.

9. The expenses of the Union shall be borne equally by all clubs belonging to the Union.

VOTING.

10. Each representative shall be entitled to one vote, and voting by proxy shall be allowed.

AMENDMENTS.

11. Amendments to these rules may be adopted at any meeting by a two-thirds vote of the Union, provided due notice of such amendment has been given in the call for the meeting.

A meeting was held on April 15 in New York, at which officers were elected as follows: Chairman, Com. E. E. Flynt, Wave Crest Y. C.; Sec'y, George F. Pigott, American M. Y. C.; Council, F. S. Sweeny and W. H. Dixie, New York M. Y. C.; S. H. Lane and George Orrok, American M. Y. C.; and E. E. Flynt and E. B. Hopkinson, Wave Crest Miniature Y. C. Another member will be elected.

The first general regatta, open to Union clubs, will probably be held in the middle of September.

YACHTING NEWS NOTES.

The Pine Lake Y. C. has accepted the challenge of the Pewaukee Y. C. to race for the Pabst cup on July 9, on Pine Lake.

A fin-keel, similar to the noted Dilemma, is now building at the shops of Hallock & Son, Center Moriches, Long Island, for J. B. King, owner of *Elsemarie*, schooner, who will use her about Newport. She is 38ft. over all, 25ft. l.w.l., 7ft. 6in. beam.

Three of the one-design schooners are now under way at the yard of Brown & Son, Tottenville, the order originally placed on City Island, by Mr. Buchanan, having been cancelled and later placed with Brown & Son.

The D. Van Nostrand Co., of New York, has recently published two very successful and practical works on nautical subjects. The first of these, the "Naval Militiaman's Guide," by Lieut. John H. Barnard, 1st Naval Battalion, N. Y., is particularly opportune at the present moment, when the attention of the whole nation is directed to its naval fleet, and when the papers are filled with naval terms, with which the average landsman is unfamiliar. The book is intended as an elementary guide to the landsman in the understanding and use of sea terms, and in that work, such as boat handling, which falls to the new recruit in the naval militia. A short chapter on "Phraseology" defines some of the more important

nautical terms, in particular those which are most likely to be misapplied, such as "pulley" for block. Other chapters deal with rigs and types of vessels, spars and standing rigging, sails and running rigging, ground tackle, handling boats under oars, handling boats under sail, and the handling of steamers. The book is clearly written, and the definitions and explanations are explicit, and in simple language easily understood by the non-technical reader. One useful feature is a reference index to various standard works, such as "Luce's Seamanship," where more extended information on seamanship, gunnery, navigation, etc., may be found. Apart from those for whom it is specially intended, the young naval militiamen, the book will be of value to all who propose to follow the stirring news of naval warfare which will fill the magazines and papers for some time to come. The price is \$1.25.

The second book, "Model Engines and Small Boats," by Nevil Monroe Hopkins, opens up a most inviting field to every boy possessed of love of engines and boats, and a fair amount of mechanical ingenuity. It deals with the construction of model engines of various types, not from castings for which expensive patterns are required, with an elaborate outfit of tools, but from such simple materials as brass tubing, sheet and wire, easily obtained in small quantities and readily manipulated by means of a modest plant of files and drills. The author begins with the simplest form of single cylinder oscillating engine and shows how it may be constructed from a short length of brass tubing and a little sheet brass and wire, leading up to a very practical and efficient model of a slide-valve engine with reversing gear. The various operations, each in itself simple and requiring only files, drills and taps, are described in detail, with numerous illustrations. The subject of boilers is treated in the same manner, directions being given for the construction of several types. A short chapter on elementary designing tells the amateur how to plan out his work in advance on paper. The author follows a novel system of hull construction, the wooden frame being "plated" with strong cardboard, which is protected from dampness by six to eight coats of shellac. This simple method is recommended by him as producing a strong, light and watertight hull. The amateur who studies the book carefully will find no limits but his personal skill to the production of quite elaborate working models from such materials as may be had at a small expense from any dealer in small tools and machinists' supplies. The price is \$1.25.

This is about the time of the year when the yachtsmen are suffering most from the yachting fever. It first makes its appearance about the middle of February in a tendency to linger about pier-heads, bridges, or anywhere that there is a sight of the blue water and a sniff of the salt air. Later it develops into the desire to visit the boat as she lies hauled up for the winter, and crawling in under the canvas cover, to poke about in the well-known nooks and corners, think over the good times of the past, and plan changes and improvements for the future. But it is about the first of April that the early yachting fever is at its height. That is the almost uniform time to begin putting the boats into the water; the yacht-yards are humming like bee-hives, and everyone is working to get his boat in commission as soon as possible. And from the time that the work of getting the boat ready first begins, the real enthusiast finds it hard work to let a day pass without paying a visit to his pet, and noting what had been done since his last visit. It gladdens his heart to see the ugly canvas covering swept away, and his craft's graceful lines once more in sight, and then to follow every step of the transformation; to see the rusty sides once more shine with snowy white or glistening black, the stubby lower sticks, surmounted by the graceful, tapering topmasts, with their sweeping, airy drapery of running and standing rigging, the bright wood once more clean and polished, and the cushions and draperies in place in the cabin; and then some day at low tide to haul the cradle down to the water's edge and wait for the rising tide. What is more blissful to a thorough yachtsman than the first heave of his craft under him, as the water lifts her from her cradle, unless it is to feel the kick of the wheel in his hands, as with sleeping canvas and roaring bow she bends to the wind, and goes sweeping away from the city and its wharves for her summer anchorage.—*Land and Water*.

The Pacific Interclub Yacht Association has published a very handsomely made code book, containing its special yacht code, for the use of the associated fleet of San Francisco Harbor. The code signals and the club burgees are beautifully printed, and the book is in appearance a credit to the makers. The Association includes the San Francisco Y. C., Pacific Y. C., Corinthian Y. C., Encinal Y. C., California Y. C. and South Bay Y. C. The code is prepared with special reference to the locality.

Mr. H. W. Hanan, who has recently sold *Acushla* to Com. Wills, Indian Harbor Y. C., has ordered a 51-footer from C. C. Hanley. The new yacht will be a centerboard boat, and will race against Syce.

HERMIONE, STEAM YACHT, DESIGNED BY G. L. WATSON, NOW HAWK.

From *Le Yacht*.

Mr. B. Leroy Woodard, Campbells, Mass., has been doing some good work recently with his Remington and U. M. C. shells, he making a few clean scores at Worcester on April 15 in the wind and rain, and being the only one to break 10 straight in the team shoot.

The Grand American Handicap.

NEW YORK, April 21.—*Editor Forest and Stream:* It seems somewhat unfortunate that so successful a shoot as the recent Grand American Handicap should have given rise to such an amount of hostile criticism as has been poured upon it and its promoters, the Interstate Association, by certain daily papers published in Western circles. Having been closely identified with the management of the last three Grand American Handicaps, I feel personally interested in having these attacks, and the misunderstandings that gave birth to them, ventilated as thoroughly as the columns of the sporting press will admit, with a view to relegate them to the position they ought to occupy in the history of the greatest live-bird event in the world.

While it is perfectly true that the Interstate Association is a corporation composed entirely of manufacturers of and dealers in sporting goods, it is also perfectly true that this Association was not formed to cater to any one section nor to individuals. The purpose for which it was organized was the encouragement of trap-shooting, with the idea of increasing the consumption of the various articles manufactured and dealt in by the firms forming the Association. There is nothing quixotic or disinterested about its methods. Everything it does, or has done in the past, has been devised with that one end in view. The selection of the Southern and the New England States as the scene for its circuit of target tournaments in the last three years has been made solely with a view to fostering a spirit of trap-shooting in those sections where the sport had little more than a mere foothold. That was business.

It was business too which prompted the Interstate Association to retain the Grand American Handicap in its list of fixtures. From a very small beginning in 1893, the Grand American Handicap has grown to be something more than an experiment. It has been a record-breaker during the past three years. In 1896 it broke all previous records, and since then has kept on eclipsing its own records, until in this year it reached a mark scarcely dreamed of before—207 entries, with 197 actual contestants! After quoting the above figures it almost seems superfluous to say anything more in the way of explaining the action of the Interstate Association. It needs nothing in the way of a defense. Results show that its policy has been approved of by the shooters of the country. It seems, however, that there is still some misunderstanding as to the rights of the Interstate Association and the rights of the shooting public respectively in this great annual live-bird tournament.

First, it is made to appear that (judging from the above-mentioned daily newspaper reports) the shooters of the West look upon it as a right belonging to them, that the Interstate Association should hold its Grand American Handicap next year at some point in the West, Chicago, for instance. This I look upon as a slur cast upon Western shooters by some hungry space writer, who has grasped at an expressed wish and magnified it into a declaration of right. My reasons for so thinking are the interviews I have had with visitors from Western points both during the Grand American Handicap and at tournaments held since the date of the great shoot.

Next, as I have said before, the Interstate Association is in the business not for its health, but for profit. It cannot, therefore, with any degree of wisdom go beyond its means, and the advertising obtained through the medium of the Grand American Handicap is bought at a good price. While the Grand American Handicap has now grown into an event of national importance among trap-shooters, it is still a private enterprise, and as such it is likely to remain. Such being the case, the Interstate Association names date and place, and draws up a programme which it carries out faithfully to the best of its ability, being governed by the time limit of three days for its tournament. This year, to accommodate the shooters in the tie for first place, it violated its rule and ran over into a fourth day.

The selection of locality is the most important point of all. Learning by bitter experience in the years of 1895 and 1896 that it was necessary to make more than ordinary preparations for the comfort of the shooters, the Interstate Association is never likely to take the Grand American Handicap to any place where 200 shooters cannot be accommodated with comfort to themselves, whether the elements are propitious or not. Being a fixture that falls due in the springtime, when the weather is fickle, shelter from the storms that may come is a sine qua non when it comes to choosing the scene for the Grand American Handicap. Having been present as a newspaper man at all the meetings of the Interstate Association when the choice of grounds was under discussion, I think I may state without fear of divulging any State secrets that this point had more to do with the selection of the grounds than anything else. The comparative inaccessibility of Elkwood Park was more than counterbalanced by the ample accommodation furnished for the shooters, and by the perfect equipment of the grounds. The question of East or West, North or South, never appeared in the discussion on location. To get the shooters to the grounds; to house them well and comfortably; and to carry out its programme to a successful conclusion, have always been the aim of the Interstate Association. That, again, is business.

As to the programme and the division of the moneys, it seems very strange that we should not have heard something of that prior to the conclusion (and the successful conclusion too) of the sixth annual Grand American Handicap. The division of moneys in this event has always been "high guns, not class shooting." It would be tiresome to count the number of times that phrase was repeated in the programme for the event of 1898. Anybody who read the programme with any degree of care must have seen and noted that "high guns" would win the money in every event, not in the Grand American Handicap alone.

In 1896 there was no disapproval of this method of dividing the purse, but in that year there was not a single straight score. The eight 24s and the thirteen 23s divided the purse. The 22s got nothing.

In 1897 there was still no expression of dissent in regard to the division of the purse. In that year Hon. T. A. Marshall won first money, \$500, as the result of his 25 straight, which was the only one made. The weather was wild and stormy, and the birds were exceedingly good, hence the three-miss men got into money. The 24s each drew down \$188.45, the 23s received \$99.50, and the 22s got \$19.55 apiece.

Then came this year's event, with good birds, a first class lot, but with little or no wind to help them. The result was nine 25s and twenty-two 24s. Each of the 25s drew down \$412.60, while the 24s got \$61.85 each. The 23s got nothing. Still thirty-one men out of the 207 entries got into the money, being a proportion of a little more than one out of every six entries. If anybody has one of the programmes for the Grand American Handicap lying on his desk let him turn to it, and he will find that the Association, in figuring out the moneys in the purse, had calculated up to 170 entries, making two additional moneys for every ten entries above sixty; pretty close figuring, I take it. At the time of drawing up the programme, it was thought to be scarcely worth while to figure on more than 170 entries, so the proviso was made that in case there were more than 170 entries, all money in the purse in excess of \$4,250—that is, 170 entries at \$25 each—should go to form a fund to be divided equally among the ten high guns. This was thought by some to be wrong, but did any one, save the most sanguine, expect that there would be an addition of thirty-seven entries to the number figured upon? This gave a sum of slightly over \$80 to each of the ten high guns, the total purse, forfeits and post entries included, amounting to \$5,075.

Suppose, however, that the Interstate Association had embraced a total of 200 entries in its figures, continuing its proportion of an additional two moneys for every ten entries over and above the sixty entries required to fill the guarantee of \$1,500. This would have raised the total number of moneys from twenty-five to thirty-one. But there were just nine 25s and twenty-two 24s, or exactly thirty-one shooters in for money in those two classes alone! The forty-five 23s would not have received very much apiece, would they?

Again, much stress has been laid upon the fact that the 25s each received \$412.60, while the 24s, with one kill less, only received \$61.85 each. This it was pointed out was a discrepancy that was absurd, and not warranted by the score of only a solitary kill more to the straight man's credit. But suppose that the nine straight scores had shot out for the money as well as the cup. Fulford's 48 straight and Loomis' 47 straight would have netted them \$600 and \$500 respectively, while Junius Davis (Jim Jones) would have received \$400 for his 38 straight. How about the proportion there? Loomis killed 9 birds more than Jim Jones.

Continuing this analysis, go on and figure out what would have happened had the twenty-two 24s shot out for place and money. Six of the 24s would have been shut out, while the last nine men on the list of those in for money would have received only \$55 apiece. Also Elliott and Wagner, the two men in the straights who fell out in the first round of the ties, would have divided only 13 per cent. of the surplus, while the high man in the 24s would have taken 5½ per cent. of the surplus. Not much difference there after all, is there?

It is rather interesting to note that the stress is laid chiefly on the fact that a man scoring 92 per cent., or 23 out of 25, did not get into the money. Such a score, while certainly a good one, is good only relatively as it were. There were thirty-one shooters out of 197 who made scores better than 92 per cent.; and nine of the thirty-one made 100 per cent. As a matter of fact, it is only fair to presume that had there been a gale of wind, such as prevailed in 1897, the majority of those 23s would have been com-

paratively just as far out of the money as they were under the existing circumstances. While this may not be true in every instance, yet the argument is good as a whole.

Knowing as I do the value of space in the trap columns of a sportsman's journal, I must plead the exigencies of the case as my excuse for trespassing so boldly upon the same.

EDWARD BANKS,
Sec'y The American E. C. & Schultze Powder Co., Ltd.

ON LONG ISLAND.

EMERALD GUN CLUB.

Brooklyn, April 19.—The Emerald Gun Club held its monthly club shoot to-day. The event was at 10 birds, point system. The scores:

NEW UTRECHT GUN CLUB.

Woodlawn, April 23.—The bi-monthly live-bird shoot of the New Utrecht Gun Club was held at Woodlawn to-day, and it was fairly well attended. The birds were a good lot, and also the shooting was good. Close scores were the rule. The grounds are in first-class condition. The addition to the house has been completed, and we will now be glad to have any of our friends to come and see us, and we will not feel ashamed of our grounds. The special cup shot for yesterday is to be contested for in live-birds shoots for the remainder of the season. The cup will be a beauty. Distance handicap and point allowance will be given in this contest.

Club shoot: Class A.

BROOKLYN GUN CLUB.

April 23.—The shoot of the Brooklyn Gun Club, held on its grounds to-day, was well attended, and the moments from the time the first gun was fired till the last were busily occupied with competition of some kind. Mr. Banks refused to enter in any of the sweepstakes, shooting for birds only, thus giving the poorer shots a showing in the top of the scale. In the two merchandise events, however, they being handicap events in which the competitors received a fair allowance of misses as breaks, he joined in the competition, he being scratch man, a hopeless position in an event of that kind.

Beveridge won handsomely in the gold button event with a straight score, the only one of the event. Wright won in the gun case event. The Troisdorf cup event was won by Waters. Several more contests are necessary before the absolute winner is determined.

No. 9 was a fast event between Banks and Swan, each shooting his Winchester with the full six loads. Their quickness and precision were extraordinary, there being smashed targets in the air close to each other while they were shooting. Their performance was heartily applauded.

The weather was pleasant, there being no wind until about 4 o'clock, when a gentle S. O'clock wind sprang up.

The contest for the gold cuff buttons resulted as follows:
Banks, s.....111111110111—14 Waters, 3.....1011010111101—11
Beveridge, 1.....111111111111—15 Remsen, 1.....101111011111—14
Swan, 2.....111111011111—14 Wright, 3.....1001111111101—12

The contest for the gun case resulted as follows:
Banks1111111101111101—13
Beveridge, 1.....01001111111111—12
Swan, 2.....11110110010101—11
Remsen, 1.....11111101111111—14—15
Waters, 3.....11100001101111—10
Wright, 3.....11011011011111—12—13—15
Dr Smith, 3.....11011111101010—11

The Troisdorf gun event, at 25 targets, handicap allowance, resulted as follows:
Banks, birds1111011111011111100111—21
Beveridge, 301111111111111111111—24—3—25

WESTERN TRAPS.

WEEK'S GRIST.

CHICAGO, Ill., April 21.—In the grist for the ensuing week I observe the challenge of Monsgr. Edward Bingham by Mr. W. D. Stannard, for the Cook County League E. C. cup, lately won by Mr. Bingham from Mr. A. C. Paterson. This comes off Tuesday at 11:30, and the schedule laid down by Mr. Bingham includes 20 targets, unknown angles, 25 expert rules, 25 reverse pulls, and 15 pairs—pretty near the gamut of the traps.

On Tuesday next, at 2 P. M., April 26, Messrs. Elliott and Gilbert meet for their last match for the Star cup. It would please the spectators if these two should get as hard a day for shooting as Gilbert and Parmelee met. I have seen some comment on the "low scores" made that day. Really the scores were not low at all, but very good ones. It was not a case of pop-ups, that was all.

On Friday next Mr. Paterson will meet Mr. V. L. Cunyngham, who challenges for the Chicago live-bird challenge trophy, won by Mr. Paterson in the open event. This challenge was received too late for publication in last week's FOREST AND STREAM, Mr. Paterson at a late hour determining to select Mr. Cunyngham in preference to Mr. Shepard or Mr. Amberg, as seemed his privilege under the rather loose rule governing on this point. The match will be at Watson's, of course, and will be shot at 2 P. M. Thus we shall not be altogether given up to ennui at the center of the West for the next few days.

CINCINNATI GUN CLUB.

Cincinnati is just a shade ahead of all the American Monte Carlo joint stock companies with its shares at \$5 each and \$525 paid on one night. Mr. R. S. Waddell is top hustler there, and as chairman of the committee on site is ready to report on a location for the elaborate grounds. It is trusted that this club will be one of the great ones of the country, and will make much and honorable history.

BUTTE AND ANACONDA.

It was always one of the wonders to me to see trap-shooting attain such a hold as it has out in the mountain countries of the West, where one would think the attention of shooters would fall upon other things. Yet at many mountain cities of the West the sport is followed keenly. Out in Montana the two sturdy cities of Butte and Anaconda have begun their season's friendly argument at the traps. The medal shoots of the Butte Gun Club have also begun, in the last one the medal being won by Christianson, captain of the club, with 24 out of 25, a very good score under the wind and rain, which made the sport difficult and unpleasant. Butte Gun Club is getting ready for the big State shoot, May 20-21-22. An addition has been built to the club house, the puller's stand has been raised to the second story, and the grounds have been leveled off in good shape. The distances are pretty long between towns out in Montana, but the State event has not yet failed of being a full success, and will no doubt be a repetition of such success this time.

WESTERN ILLINOIS TROPHY.

Mr. L. C. Huckins, of Kewanee, Ill., one of the 24s at the Grand American Handicap, was on last Tuesday presented with the season championship live-bird trophy of the Western Illinois Trap-Shooters' League; to which he is entitled by reason of totals in all the different live-bird shoots of that body during the season just closed.

CREAM CITY CRACKS.

On Monday of this week—the members of the Wisconsin Gun Club, of Milwaukee, made the following scores: Schmidt 18, Heiden 13, Bush 7, Himmelstein 12, Paul 16, Worth 11, Horlick 8, S. Meyer 8, E. Heiden 7.

O. K., OF K. C.

At the last monthly medal shoot of the O. K. Gun Club, of Kansas City, Gottlieb and Cockrell tied on 15 live birds straight for the trophy. Tom Graham shot as a guest of the club. Score:

W H Herman11011112122100—12

OUT.

The twenty-first annual tournament of the Missouri State Game and Fish Protective Association are out, and they are beauties, as befits the coming-of-age party of this strong shooting body. May 16-21, and don't forget it.
E. Hough.

1206 BOYCE BUILDING, Chicago.

CHICAGO, April 23.—The Eureka Gun Club, of Chicago, held its regular weekly contest for medals to-day on the club grounds, corner Vincennes avenue and Seventy-ninth street. The attendance was light, owing possibly to the fact that many of its members are away from the city snipe shooting. The shooting was hard, owing to the overcast sky and the strong wind, which blew from a left quarter toward the traps. Large scores were infrequent during the day. The following are scores in the practice event preparatory to the medal contest:

W D Stannard1101010001010110101010—13	
Sprague0010000110001011111011—14

St. Louis Tournament.

St. Louis, Mo., April 21.—The closing of the three days' shoot here yesterday added some more history to the sport, though nothing unusual. There were no new records nor any old ones broken, neither in regard to the skill displayed nor in the way of attendance. There were plenty of visitors here, but for some reason that is inexplicable the locals failed to turn out; that is, if you except the old guard who are always on hand. Why no more of the home shooters turned out is a mystery, as the programme was certainly a most liberal one, from which all trade representatives were barred and none but those whom we designate amateurs could participate. With \$300 added and 2-cent targets, this should have been well represented. St. Louis can boast of at least a dozen gun clubs, and yet, all told, scarcely that number of local shooters participated. There is more than enough material here to make a good, big tournament without assistance for the outside shooters; but this will never be, unless all pull together, and only by such an effort can St. Louis regain its former prestige as a shooting center. Let us hope that this may occur ere long, and that the next time a tournament is held here all the locals will turn out and thereby assist in making such ventures the success they deserve to be.

VISITORS.

Here are the names of those who were present: H. E. Bonebrake, El Reno, Okla.; Wm. Gerst, Frank Legler and Wm. Elliston, Nashville, Tenn.; F. C. Riehl, Alton, Ill.; G. E. Crosby, O'Fallon, Ill.; Wm. Montgomery, Moro, Ill.; F. N. Cockrell, Platt City, Mo.; W. M. Bates, F. O. Diemer and T. E. Pratt, Palmyra, Mo.; G. C. Beck and E. H. Tripp, Indianapolis, Ind.; H. J. Sconce, Sidell, Ill.; Tom Graham, Rosedale, Mich.; G. W. Clay, Austerlitz, Ky.; Fred Schiess and J. W. Beall, Alton, Ill.; Elmer Apperson, Kokomo, Ind.; Lou Erhardt, Atchison, Kan.; John J. Sumpter, Hot Springs, Ark.; John Parker, Detroit, Mich.; A. M. Bernhard, Hastings, Neb.; J. W. Den and Fred Boehner, Arapahoe, Neb.; E. E. Baker, Kewana, Ill.; W. T. Peoples, Shawnee, Okla.; J. L. Winston, Washington, Ind.; Dr. Knowlton, New York; W. G. Sergeant, Joplin, Mo.; W. F. De Wolf, Chicago, Ill.

GENERAL AVERAGES.

Here there was \$45 set aside for average money, to be divided among the five high guns on the old percentage system of 30, 25, 20, 15 and 10 per cent. This was won by Sergeant, Tripp, Apperson, Connor and Graham in the order named. Fifteen shot in all the target events scheduled for the two days, and finished as shown:

Sergeant	300	262	87.1	Sumpter	300	232	77.1
Tripp	300	255	85.0	Beck	300	228	76.0
Apperson	300	219	83.0	Sconce	300	227	75.2
Connor	300	248	82.2	Pendergast	300	224	74.2
Graham	300	239	79.2	Gerst	300	221	73.2
Elliston	300	238	79.1	Lenhardt	300	218	72.2
Bernhardt	300	236	78.2	Nold	300	189	63.0
Clay	300	235	78.1				

This week it will be Junction City, Kan., or Peru, Ind., just as you choose.

FIRST DAY, APRIL 18.

Everything considered, Sergeant's 92 per cent. is quite a creditable piece of shooting, this being easily first, as no one else could approach the 90 mark. Graham is second with 87.3, Tripp third with 86.0, Elliston fourth with 84.6, while Apperson and Sumpter come next with 84.0. With the exception of Sergeant's score, none of this is very high-class work, but the weather is somewhat responsible for it. Most of the day a mean, nasty rain fell, which made it very disagreeable; and the light being poor it was very hard to locate a target promptly and properly. There were few straight scores made during the day, and as a rule those that were paid well. In No. 1 Sergeant and Tripp made one. In No. 2 there were none, but Apperson won first alone on 19. Fourteen was high in No. 3. Haweater made the only straight 20 of the day in No. 4, while again in No. 5 Sconce was the only one to make 15, and got first undivided. The only other straight of the day was Dr. Knowlton's 25 in the seventh event. This was first with a bird to spare, being the best pot won so far.

Thirty-seven participated, and of this number twenty-five shot all the events. Owing to the bad weather the shoot dragged along, but the programme events were shot out by 5 o'clock.

Events Nos. 1, 3, 5 and 7 were at known angles, while the others were shot at unknown.

SECOND DAY, APRIL 19.

This was a great day for some one to make a scoop, if they could have developed any old sort of a streak, and it need not have been anything extraordinary either. This is evidenced by the fact that .83 was the top percentage of the day, and that not a single straight was made in the entire events. Sergeant won first money on 14 in No. 1. Tripp on 18 got all of first money in No. 4; and in the fifth Tripp and Sergeant got all of first and second on 24 and 23. There were several instances where third, fourth and fifth money was won without a tie. But while the reader is contemplating how he would have got some easy money here if only present, there is something that remains to be told. For several days previous the weather had been very warm; so much so that overcoats and woollen underwear had been dispensed with. Now to-day the weather is bleak and cold, the wind blowing a gale that penetrates and cuts to the marrow. Overcoats none too comfortable, and the stove in the club house is kept hot, and is being well patronized. Not only did the wind play havoc with the targets, but the cold soon chilled one through at the score, so as to make the shooter slow and lose his time. This will explain away some of the mysteries of the poor shooting.

While more shooters participated than yesterday, not near so many shot through. Only eighteen did not miss an event. After the target programme had been finished a \$2 miss-and-out was started. This had nineteen entries, and Dr. Starkloff, Tripp and Elliston cut up the money after scoring 7 birds, Sumpter losing out in this round by having a good bird fall dead just out of bounds.

The programme to-day was the same as yesterday, and the same conditions prevailed.

THIRD DAY, APRIL 20.

This was live-bird day, and the only event was a 25-bird handicap. With 34 entries and but one set of traps it will readily be seen that it would require all the time to finish this event. The weather was bright and clear, but there was a high wind blowing diagonally across the grounds, and it made what would have been only an ordinary lot of birds extremely hard ones. At times some were as swift as ever left the trap. Among these Boehner got one that was beyond comparison. These, as is usually the case, invariably escaped.

The conditions of this event were \$15, birds included, five money, class shooting, with a very handsome charm for the winner. The race was close enough to be exciting all the way through, and was finally won by Dr. Starkloff, a local shooter, who scored the only straight. The win proved to be a popular one, as the Doctor is one of the most enthusiastic of local shooters, always contributing liberally to anything that will advance the shooting interest of his city. As is frequently the case, it is asserted by some that the Doctor was fortunate in drawing easy birds; but this can probably be attributed to the excellent time he was shooting in, and at all times using the best of judgment. To one familiar with the sport it is well known that the best of birds appear easy when the shooter is in good form and shooting in good time. This fits the Doctor's case exactly, and for this his win is all the more creditable. Then too he is no novice at the sport, and is liable to duplicate his performance of to-day at any time. Shooting from the scratch mark as he did it was nothing but pluck and skill that won the race for him. That he possesses these most essential qualities he has over and again demonstrated.

Five—Dr. Knowlton, "147," Tripp, Howard and Sconce—scored 24, so it will be seen that the winner was chased clear up to the finish. Of those who finished with this total, Knowlton and "147" did the best shooting; the bird that each lost was a very difficult one, and both were shooting from the scratch. Tripp shot at 29yds., and the only bird he let escape was not a hard one. The other two, Howard and Sconce, both shot at 27yds., though being new beginners at the trap they put up a good race.

The order in which the others finished is shown in the appended score, along with the fight and the number of the trap. Herbert Taylor made a most acceptable referee.

Trap score type—Copyright, 1898, by Forest and Stream Publishing Co.

Brockton Gun Club.

BROCKTON, April 19.—Patriots' Day was celebrated by a large number of shooters at the first shoot of a series on the grounds of the Brockton Gun Club. Everybody seemed to have a jolly time despite the bad weather. Miss Kirkwood (Miskay), of Boston, accompanied by her brother, Horace, was one of the special features of the shoot. The conditions were not favorable for high scores, yet Miskay made four clean scores of 10, and was second in average for the day. A number of the shooters put in good scores for the merchandise prizes. Scott carried off the watch charm after shooting off a tie with Bradley, of Lynn; he will wear it until the next shoot, April 30. Le Roy made a clean score of 25 straight. As he was the one who donated it, he declined to shoot off.

No. 10 was a merchandise match, 25 targets, with handicap allowances added, unknown angles, 25 cents entrance.

A. A. BARRETT, Sec'y.

Pigeons at Memphis.

THE interest in the contests for the possession of the Memphis Gun Club's live-bird medal is wrought up to a high pitch by the result of the last two contests, in each of which A. H. Frank has proved the victor. The fourth contest for the trophy took place April 12, and there were ten members on hand to dispute for the possession of it. Frank, however, was in rare form, and ran up a straight score of 25. In addition to this he shot in a 5 and 10-bird sweep, scoring 5 and 9 respectively, making 39 out of 40 for the day. Poston also shot well, scoring 24 in the medal race, and 10 straight in the sweep.

The birds for the trophy shoot were selected from a large lot, and should have been capital ones.

On April 16 the fifth contest took place, and Frank again proved the winner, and that too on a straight score. This time though it required even more than this, as his was not the only straight, Poston also duplicating his feat.

But in the shoot-off Frank won out, and to him falls the honor of being the first to win it twice. Previous to this each contest had been productive of a new victor, Allin, Divine and Edrington having won it in the order named. Poston has tied for it twice, but has as yet been unable to land it. Who can tell but what his turn will be next, as the form he has displayed all through these contests must eventually win for him. This, however, cannot be long deferred, for should Frank win it again, he becomes the permanent possessor of it. This he is likely to do, as he possesses all the pluck and confidence so essential in contests of this nature. To-day he scored 38 out of 40, while Edrington scored 37 out of 40.

The weather conditions were perfect, though there was no wind to help the birds along.

April 12.—Medal shoot, 25 live birds:	
T. A. Divine, 28	202211211111011122121202-22
I. Bennett, 29	20221222222022222222-21

S. P. Walker, 29	22212210212121111021*1-21

There will be war in the camp at the next shoot; all will be pulling to keep Abe from making three successive wins.

Boston Gun Club.

WELLINGTON, Mass., April 20.—The last shoot of current prize series took place at Wellington Wednesday afternoon last. The wholesale trap-shooting of the previous day, a holiday in this section, depleted the ranks somewhat, but a dozen attended, quite oblivious of the cloudy and moist weather conditions. Eastman and Horace tied for first prize, a gold watch charm, but according to the rules of the contest the former won it, having attended all the shoots, and Horace only ten. The shooting of both during entire series has been excellent. The best six scores during the fourteen contests, beginning Jan. 12 and concluding to-day, form the prize total, and below are given the complete results. Eastman and Miskay discarded eight scores, Spencer 7, Taft and Gordon 5, Horace and Woodruff 4, Leroy 2, Hollis 1 and Paine none.

The team match was somewhat of a foregone conclusion at this last stage, 7 targets separating first and second; Eastman and Taft requiring a 39 to win, provided Miskay and Horace failed to advance. The latter improved 2, the latter 4 targets, so the Thurman shooting blouses go to Miskay and Horace, and now Miskay is complaining because Thurman blouses are not made for ladies.

Mr. J. R. Hull, representing Parker Bros., was a visitor to-day, and acquitted himself very creditably on the varied shooting, and particularly so on the three 5-target events at 21, 22 and 23yds. rise.

Events:	1 2 3 4 5 6 7 8 9 10 11 12 13 14
Targets:	10 10 3p 10 10 5 3p 10 10 10 5 5 5 10
Gordon, 17	7 5 5 7 7 5 3 9 7 8 4 2 1 8
Miskay, 18	9 8 3 7 8 5 4 7 9 7 2 4 5 6
Leroy, 21	7 6 3 10 4 4 3 9 9
Woodruff, 17	7 8 4 9 8 5 4 10 9 9
Benton, 14	3 4 3 2 4 1 3 6 6
Hull, 18	10 8 3 8 9 3 4 9 9 8 3 5 5 9
Eastman, 16	9 7 5 10 8 4 5 10 10 8 3 2 2 8

Horace	111111111-10 101110111-8-13-31
Hull	011111111-9 111011111-9-18
Dickey	111101011-8 101101011-7-15-33

Winners of prizes, with totals; possible 126:	
Eastman, first	19 18 18 17 17 16-105
Horace, second	19 18 18 17 17 16-105
Miskay, third	18 18 17 17 17 16-103
Spencer, fourth	18 18 17 17 16 16-102
Leroy, fifth	17 17 17 16 16 16-100
Woodruff, sixth	18 17 17 16 16 15-99
Taft, seventh	18 16 16 16 15 14-95
Gordon, eighth	18 17 15 15 15 14-94
Hollis, ninth	21 17 15 14 14 13-94
Paine, tenth	17 15 15 14 14 12-87

Team totals, possible 200:	
Miskay and Horace	35 35 35 34 32-171
Eastman and Taft	35 34 33 33 31-166
Gordon and Woodruff	35 33 32 31 31-162
Leroy and Spencer	35 34 31 30 29-159

The summer series starts Wednesday, April 27, and continues until June 29, with prize contests at 30 targets, 10 known, 20 unknown and 10 reverse angles.

Boston.

Fitchburg Rifle and Gun Club.

FITCHBURG, Mass., April 21.—The members of the Fitchburg Rifle and Gun Club opened the season with an all-day shoot on April 19 although the day was dark and it rained more or less, yet it did not dampen the ardor of the boys, and darkness only stopped the shooting. We shoot entirely for sport, and the fun is fast and furious from start to finish. A merrier set of sportsmen it would be hard to find.

The following is the score:	
Events:	1 2 3 4 5 6 7 8 9 10 11 12
Targets:	10 5 10 10 5 10 10 5 10 5 10 10
Smith, 13	3 3 4 7 5 6 4 1 4 3 5 7
Whitaker, 13	7 3 5 7 3 3 4 4 3 4
Estabrook, 13	5 5 5
Field, 13	3 3 3 5 4 8 7 3 5 2 5
Hooks, 13	7 4 6 5 4 6 5 2 6 1
Stickney, 13	5 3 6 4 5 7 6 4 3 4
Converse, 13	3 1 8 5 3 3 6 4 4 3
Woods, 16	8 4 4 4 4
Wright, 16	3 4 5 5 3 5 4 3
Bingham, 13	5 2
Train, 13	4 1
Kirkpatrick, 13	4 5 5 5
Fenwick, 13	1
Ziegler, 13	3 4
Richmond, 16	4 1 1 1 1 3
Dix, 16	2 4 1 5 5 5 4 2 8 8
White, 13	3 6 6 4 3 2 1 3
Jenna, 13	1 2 1 2 1
Atwood, 13	3 1 1 1 5 5
Demmon, 13	1 2 1 4 1 1
Hawkins, 13	2 8 8 9 4 5 1 7 6
Curly, 13	4 5 2 1 3 2 5
Bradbury, 13	1 2 2 4 4 2
Wilber, 13	3 7 4 3 7
Liversage, 13	3 3 5 1 4 1 5
Jackson, 13	2 3 1
Putnam, 18	1 4 8 5 8 4 4 3
J. Rice, 13	1 3
Cutler, 13	5 3 5 4 5 7 3 8 7
Leonard, 13	2 4 4
Austin, 16	3 5 5 5 6 1 1 6
Parker, 16	3 3 3
Elliott, 13	4 4 3 1

Events 1 and 2, known angles; 3, 4, 6, 8 and 10, unknown traps and angles; 5, 11 and 12, incomers; 7 and 9, pairs.

IRVING O. CONVERSE, Sec'y.

Trap at Worcester.

WORCESTER, Mass., April 12.—At the opening shoot for the L. C. Smith trophy some excellent scores were made, especially those of E. S. Knowles and Jack Hull, both breaking 48 out of their 50 targets. Jack lost his 25th bird in his first 25 and his 22d of the last 25. Knowles won the trophy, as Mr. Hull was not a member of the gun club, but oh! how he did shoot!

Following are the scores of the L. C. Smith trophy contest: Hull 48, Knowles 48, Snell 46, Forehand 45, Hanson 44, Walls 40, Roach 38, Emory 37, Buck 32, Bucklin 32, Kinney 30.

April 15.—The State shoot to-day was a failure, as the day was too rainy to shoot; only a few shooters ventured out to the shooting grounds. The following events were shot:

Events:	1 2 3 4 5 6 7
Targets:	10 10 10 10 15 15 20
Leroy	10 10 6 6 13 9 16
Smith	10 5 6 8 8 10 14
Jones	9 10 7 7 10 12 14
Chapin	8 8 8 5 9 9 13
Events:	1 2 3 4 5 6 7
Targets:	10 10 10 10 15 15 20
Walls	7 10 7 8 11 11 17
Davis	10
Forehand	7 8 9 13 12 17

Haverhill Gun Club.

HAVERHILL, Mass., April 23.—Tuesday, April 19, was Patriots' Day in this State, and the Haverhill Gun Club celebrated the day by holding an all-day shoot on their grounds at Hoyt's Grove, in this city.

It was the opening shoot of the season, and was a decided success, everything running without a hitch to mar the enjoyment of the shooters from beginning to end, though it must be confessed the shooting was nothing to brag of. Our captain, Mr. Miller, was high gun for the day with an average of 77 per cent., but it must be remembered we are only two years old, as an organization. We have done no shooting since Christmas Day, and many of the shooters were shooting at the traps for the first time. Then too we have never favored "kindergarten birds" very much on our grounds, and the strong and erratic wind added much to the speed of the targets, besides causing them to indulge in all sorts of antics, thus making them puzzling marks for the older members and the despair of the "green hands."

Below you will find the events in tabulated form, and the scores made:

Events:	1 2 3 4 5 6 7 8 9 10 11 12 13 14 15
Targets:	10 15 10 15 10 15 10 20 20 10 15 10 15 10 10
Angles:	K K U U R R S K U R R U U U U

FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

TERMS, \$4 A YEAR, 10 CTS. A COPY. }
SIX MONTHS, \$2. }

NEW YORK, SATURDAY, MAY 7, 1898.

VOL. L.—No. 19.
No. 346 BROADWAY, NEW YORK.

The FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. The editors invite communications on the subjects to which its pages are devoted. Anonymous communications will not be regarded. While it is intended to give wide latitude in discussion of current topics, the editors are not responsible for the views of correspondents.

Subscriptions may begin at any time. Terms: For single copies, \$4 per year, \$2 for six months. For club rates and full particulars respecting subscriptions, see prospectus on page iv.

SOME RECENT EXAMPLES.

A PHYSICIAN of New York city who spent the month of August of last year at the headwaters of the Aroostook River in Maine, where excellent fishing was enjoyed with $3\frac{1}{2}$ lb. trout, found himself in a rich game country. He saw at least a hundred deer, two caribou and five moose; and was so close to one of the moose that he "spanked it with a paddle." But not a shot was fired. The excursion was for fishing; it was not one to kill even incidentally game in the close season. Commenting on this, a correspondent remarks: "It is refreshing to know that here was at least one sportsman who could resist temptation to violate the laws of the State of Maine."

Unstinted credit is due such right living in the woods, but it would be a mistake to consider this instance unique. The record may rather be taken as typical of the rule of conduct observed by an increasing proportion of fishermen who go into the woods in summer. That rule is to observe the laws of the land, the laws of nature, and the obligations imposed by one's self-respect. We could match the record of the New York man with that of others. There was Mr. W. H. Wesson, of Springfield, Mass., who spent two months in the Maine woods last summer and refused to take firearms on the trip, inasmuch as "there would be no game in season, and no use for a gun." And there was Mr. Fred Gould, of Boston, who went moose calling in Maine on the night of October 14, before the opening of the season, and went without firearms, since the purpose of the enterprise was to call and see the moose, and not to shoot it. The calling was entirely successful; for Edgar Harlow brought the bull so near that the men, being unarmed, were with good reason frightened. It is a pleasure to add that on the night of the 16th Mr. Gould got his moose.

The rule of strictly and cheerfully observing the laws obtains in growing degree with sportsmen and guides in every important hunting district. Testimonies to this effect come not from Maine only, but from the Adirondacks, Minnesota, North Carolina, and in fact wherever residents and visitors are learning for themselves by practical, personal observation, experience and thinking the homely lesson of supply and demand. We are quite likely to have wrong impressions on this subject, because we perhaps hear and read more about the law-breakers who are censured in print than about the multitude of the law-abiding, concerning whose correct conduct in field and camp no chronicle is made. It is thus regarding sportsmen in some measure as it is with Indians, for the majority of people never hear anything about the red man except in connection with some Indian trouble, for which reason they get the notion that the savage is always on the rampage. There is in this town a daily paper which makes a specialty of chronicling the shortcomings of clergymen, and those who get their notions of the clergy from reading this journal are not more mistaken in their estimate of the character of men of the cloth than one might be regarding sportsmen in the field, if his judgment concerning them were based wholly on the frequent reports of game law violations.

The man who sets out to be a law unto himself, and to kill wantonly and beyond reason, in these days is quite likely to find rebuke where it is little expected. They tell a story of a visiting angler at a well-known Maine camp, last summer, who, finding the fish in abundant supply, caught so many that there could be no possible utilization of them for food; and quantities were thrown away. When the camp proprietor expostulated with the guest and urged him not to kill fish for waste, the reply was in substance that there were plenty of trout, the guest paid his board, and he proposed to do as he pleased. The rejoinder was in the nature of an ultimatum; the man was given his passports and early next

morning took passage on the first outgoing buckboard. Such stand by a camp keeper is to be applauded. If proprietors generally would adopt the same course they would find the sentiment of anglers and shooters abundantly strong to sustain them. An assertion of the rights and obligations of decency commands respect in the woods as well as out of them.

In a different way, but none the less effectively, did a Southern host curb the wanton conduct of certain Northern guests, who were bent on beating the record for quail. There were birds galore on his territory, but when once he had taken the measure of the killers for count, he took pains to guide them to such localities as he knew to be barren of game, and persisted in this treatment until, disgusted at their successive failures to score, the deluded shooters packed off bag and baggage.

AUDUBON.

THE name of no American naturalist is so well known as that of John James Audubon; yet this does not mean much. Persons interested in science know his name well. Those best equipped in general literature know of it, but even to these last it has but little meaning. It is a name and little more. Most of those who hear it recognize it as familiar, and try to remember what Audubon did, but cannot. And yet, "the greatest monument erected by art to nature"—the "Birds of America"—was built by Audubon.

Even of those reasonably familiar with ornithology in America, but few realize the vastness of the work which Audubon accomplished, and fewer still comprehend at all what this accomplishment involved. When Audubon began—though all unconscious of the task—the labors which culminated in the "Birds of America," the country was utterly new; the War of the Revolution was not long past, there were no means of communication or of travel. Railroads and telegraphs were still far in the future. If one wished to go anywhere, he walked, or rode on horseback; if he desired to communicate with his friends in any part of the country, he sent a messenger.

Traveling on foot, Audubon crossed and recrossed the United States from the Mississippi River to the Atlantic coast, collecting with his own hands and for himself the birds of his beloved country. Without pecuniary means, yet with a family whom he tenderly loved, he was forced to devote much of his time to the support of his dear ones. In the face of difficulties which we cannot comprehend, with labors that are now incalculable and against natural dangers that are no longer known, he fought his way from absolute obscurity to the position which he longed to reach and gained the pinnacle of fame, which was his highest ambition.

As we turn over the great pages of his wonderful work, which contains 435 plates, representing 1,035 figures of birds, all of life size, we realize what this man accomplished, and yet we wonder more and more that one man should have been able to do so much. Yet such was his unfailing energy that no sooner was one task completed than he turned eagerly to another. The fervor that animated his brush later drove the "iron pen" which gave us the "Ornithological Biographies" and the "Synopsis." Toward the close of his long life he worked with the same energy on the "Quadrupeds of North America," which he did not live to see completed.

The results of his work were his own and accomplished by himself; he owed nothing—except kindness and sympathy—to any one outside his own family. If he received some species of birds collected by naturalists attached to expeditions to the further West, these were so few as to be insignificant compared with the great total. How widely different his from the work of the naturalist of to-day, whose collecting expeditions scour the utmost limits of the continent and bring back material by the carload.

In the life of Audubon—as indeed in the lives of most great men—there is a lesson that may well be laid to heart. The example of industry, cheerfulness, and never failing tenacity of purpose, which marked his long career, is worthy of emulation, and the name of John James Audubon may fitly be cited as an example for every young American.

As among naturalists to-day the name Audubon stands for American ornithology, so for us all it may well sym-

bolize that energy, endurance and singleness of purpose which we are proud to consider characteristics of the true American.

SNAP SHOTS.

Compared with the prices which have been paid at former sales the sums paid for the early editions of Walton's Compleat Angler sold in this city last week were low. The first edition, London, 1653, brought \$240; second edition, 1655, \$67.50; third edition, 1661, \$37.50; fourth edition, 1668, \$50; fifth edition, 1676, \$25. This Walton set illustrates the ways of book collecting; for having been gathered, after long and patient searching and waiting and watching, into the possession of one individual, they are now dispersed again to different collectors. Making a library of angling books is like angling itself: the satisfaction in possession comes only after the uncertainty and protracted effort of the pursuit. There have been angling libraries sold in bulk, when one could on the instant possess himself of what it had taken years and years to bring together; but such a cold check-book transaction gives one neither the interest of pursuit nor the zest of capture, to say nothing of the thousand and one diversions in the gentle art of angling.

One of the best ducking marshes on the James River in Virginia is owned by New York sportsmen, who visit it annually in their yachts. As the time they spend there is inconsiderable, and as the preserve is prolific of game all through the season, it is further utilized for market hunting, being leased to professional shooters who ship their game to market. The rent exacted is \$300 a year, and it is recorded that on one occasion with two shots the hunters gathered in ducks which netted them \$120 toward paying the rent for the season. The industry is remunerative and the arrangement profitable to all concerned. The sportsmanship of hiring out the preserve for market shooting is not conspicuously in evidence at first glance, yet it does not differ so greatly from the practice pursued at some Atlantic coast ducking clubs whose members market their game by the barrelful. In each instance it appears to be a consideration of \$300 more or less.

There are some astonishing figures in recent returns presented to the Dominion Parliament, showing the amount of Indian earnings for the last year. According to these statistics the Indians of Canada received as proceeds of the fisheries \$450,270.85; and as earned by hunting \$408,318.83. The statement "earned by hunting," as our long-time Quebec correspondent, Mr. J. U. Gregory, tells us, is to be understood as including all furs, wherever sold, to the Hudson's Bay Company or others. In these days, when we are all talking about the obliteration of wild creatures, this annual fur catch of more than \$400,000 for Canada is significant of an enormous native supply, all the more remarkable since the fur industry has been carried on for so many decades.

It was not generally understood last season that the close term of five years for deer in Greene, Sullivan, Ulster and Delaware counties in this State had expired, and knowledge of the fact was kept very close by all interested in giving the game a chance to establish itself. The district game protectors were instructed not to advertise the open season, and in every way pains were taken to discourage hunting. Some deer were killed, but the number was small, and probably the supply was not materially lessened. In the last session a measure to extend the close time for another five years was adopted, and this has just been signed by Governor Black.

The red deer put out by M. Menier, the French chocolate manufacturer, on the island of Anticosti, in the Gulf of St. Lawrence, have apparently multiplied, although at the time the last advices from the island were received at Quebec so much of the territory had not been visited that an approximate calculation could be made. More moose will be taken to Anticosti. The availability of the island for a great game preserve is yet to be demonstrated.

The largest tarpon taken on the West Coast this season fell to Mr. W. Ashby Jones, of Richmond, who captured on April 19 at Fort Myers a fish of 7 ft. 3 in., weighing 185 lbs.

The Sportsman Tourist.

Just About a Boy.—X.

THREE days had passed since the boats had crawled up against the current of the little Western river until they grounded against the hot edge of a great sandbar.

Just here the river swept around in a broad curve, washing and cutting away the bluff on one side and forming the bar on the other as the aggressive current advanced.

A fine open growth of timber back of the bar made a good camp ground, and a clear spring boiled up through the gravel to supply the best of water.

The white canvas, more or less stained by camp usage, had gleamed among the trees these three days, and furnished a home for the boy and me when we came in from our rambles through the enchanted woods or floated back in the black canoe with the water that forever passed by, steadily, resistlessly moving on, on, on.

Where it came from, where it went, were two things to which we gave no thought. It was always there, and it was the home of the fish, the ducks and the many other things that made life a day of joy for us.

Strange things came down on the ever moving current; some went by, some stranded on our sandbar and furnished a moment of wonderment and vague conjecture as we saw them—and left them there.

There were fragments of stone on the bar too, rocks that were strangers in the prairie country, and a constant source of wonder to the boy, who continually brought them into the tent to ask their history. Sometimes I had to wonder with him, and could give no information, because the rock was a stranger to me too—a stray pebble that had started—where?

At times the youngster would toss a bit of water-smoothed stone down beside me, drop to the ground himself and stretch on his stomach, his chin resting on his crossed arms, and broad hat tilted back while he waited and listened to the probable history of the fire-born, ice-milled, water-moved bit of rock that had traveled hundreds of miles and stranded on "agate bar" for the boy to find.

This rock lore was full of mountain voices, tales of the great, lonely country that basked in the sun to the westward; stories of the ruins of that part of the world called "bad lands," of crystal streams that hid flakes of gold in their sands and trout in their waters; of pine woods where wild animals roamed; and of other talk of the wilderness.

It was just the beginning of Indian summer when we camped by the sandbar, that delightful time in the year when one may dream all day and every day; and it had its effect on the boy.

He was preoccupied, thinking, dreaming, looking into the haze that dimmed the western horizon.

"Say, less take a trip to the mountains, will yeh?"

He had decided on a plan of action, and wanted my indorsement and company.

I smiled, lighted my pipe and sat down for a talk. I had already seen the backbone of the continent and the withering, soul-killing country where the gray sage grows, where the loafer wolves howl like lost souls, where the ghoulish buzzard floats in the clear air, where death lurks in the water and the blistered, alkali-strewn ground.

All afternoon I sat there and told the boy of this lost country and of the great hills that pierced the sky to the west of it while he listened and dreamed.

"Less go, will yeh?" he said when I had finished.

"Less get the outfit together 'n' light out this fall. I'm tired of this old level country where they ain't anything only th' river 'n' the woods, 'n' juss catfish. I want to git up amongst th' rocks 'n' snow 'n' pine woods—'n' I'm goin' too."

"Well, if you're set on going, we had better wait till spring, so the grass will furnish feed for the horses, anyhow. You can't travel far out there in the fall when the grass is dead and the water holes all dried up. Then again, you would no more than get to the hills before you would have to hurry back to get home ahead of the snow."

"Guess yer right," he answered, with a sigh. "Haff to wait, I reckon. Will yeh go in the spring, shore?"

"Unless something turns up this winter to prevent it, I will go in the spring and stay all summer if you like. We can take along a prospecting outfit and maybe locate some color worth working too; there is plenty of it in the hills, if you can find it, and it will give us an excuse for going anyhow."

So it was settled there by the little Western river, settled and all winter left for anticipation, which I have begun to think is more real pleasure than the trip, whether it be around the world or only an afternoon off for fishing.

The boy could always find some new interest hovering over the country we were to visit, and the questions he asked were as many and varied as the cottonwood leaves that sang in the breeze over our heads.

First it was to be a wagon and team, then this would be abandoned as the superior advantages of a pack horse outfit were discussed; then the limited capacity of such an outfit would throw his opinion back to the wagon idea again.

So the discussion went, back and forth and back again, until I said: "Let's go fishing and let the trip rest while we are in camp. We've got all winter to think it over, and when the time comes we'll be ready all right, and with the right kind of an outfit too."

"Yep, reckon we sure will," he answered, as he gathered up the rods and canoe paddles and got ready for a short hour of enjoyment before night should put out the light of the sun.

"They must be some mighty nice places out there 'n' th' mountains," said the boy, as we drifted and cast our minnows toward the rocks along the bank where we knew the big pike-perch balanced and waited.

"I've always wanted to see the mountains ever since I first heard about 'em, an' I got a idee I could juss live round 'mongst them rocks 'n' trees 'n' things all th' res o' my life 'thout botherin' a heap about anything much."

"Gee! they muss be high. Less see—12,000 feet—how much is a mile? Five thousand two hunderd n' eighty—that's right—into 12,000—that's twice and about a quarter over, ain't it? Gee! Juss think! Two mile 'n' a quarter straight up 'n' th' air! Whew! Say, that's as far's fr'm town clean to th' stone quarries down th' river. I bet them red clouds ain't that high right now. Must make a feller feel kinder queer like to git up that high 'n' look down, don't it?"

"Well, it would perhaps if you could look straight down, but you must remember that the hills begin to rise a long way from the peaks, and the country up there isn't so much different from any other rough country until you get to the pinnacles. Then it is mostly rocks piled up into needles and gashed and split into cañons that make it pretty hard to get through; the rest of it is only one hill piled on top of another for miles."

"Huh! Pictures o' mountains don't look that way. They look like they run right up from a flat country like this—that is, generally they do."

"Well," I replied, "when you are twenty or twenty-five miles away the hills look that way too; but they are different when you get there."

"Kin you ride—gee! I got a whale, I guess."

A big "spicker" had coupled on to the boy's hook and cut further discussion about the mountains short for the evening, for the sun was gone and there was only a red glow in the western sky when the big fish came in over the side and quivered in his last gasp on the bottom of the canoe.

"Less have him for supper, will yeh?" asked the youngster as he surveyed the catch.

"All right, I'm fish hungry myself, and he will make a good supper for both," I answered.

"Yep, less go to camp an' git him a-sizzlin'."

Rods were tucked away in the canoe, and the whispering paddles crooned a lullaby as the black canoe cut the surface of the river, wrinkling the red and gold reflections of the sunset into a thousand scintillating prisms of color that flickered from the brown sands of Agate Bar to the blue shadows reaching out from the foot of the bluff across the stream.

As the glow faded from the sky and the blue-black shades of night came on, our little fire burned merrily and grew hot and red against the night, half illuminating the white tent and penciling the overhanging cottonwood limbs in lines of light.

The big pike sputtered and grew brown, the coffee complained and bubbled against the hot sides of the pot, and other things gave odors to whet the outdoor man's appetite, until we sat down to a hungry, healthy man's fare there by the silent river, at the end of another day that we had lived—one day in a life that has passed to the shades of recollection now, for that was long ago, and in a country that has now become only a part of the traditions of what was once the great, limitless West.

EL COMANCHO.

Yukon Notes.—V.

An Outfit for the Yukon.

AN outfit for the Yukon should include everything necessary for a year's sojourn in the country. It should contain no unnecessary articles, and yet be adapted for a great variety of conditions, ranging in component parts from gauze netting and mosquito oil for summer use to face masks of fur or buckskin and the heaviest winter underwear.

Of course individual requirements and preferences vary, and every man will make up his outfit in accordance with his own ideas.

I shall only attempt to give a few general hints gained by personal experience in the hope that some of these may prove of interest and profit to campers out. First I shall say something about camp outfit as distinguished from personal outfit.

Camp Outfit.

The main essentials of the camp outfit are tent, stove, bedding and cooking utensils. The average party for the Yukon trip last year numbered about four men. This was a good number, for four men can handle such boats as were commonly used to good advantage, and make and break camp with expedition. Large parties are hard to manage, for there are apt to be as many minds about any question of importance as there are men, and pooling of interests and cliques are the result, while with smaller parties the camp work is greatly increased for individual members.

A party of four should have two or three tents. One 10x12 wall tent of heavy duck, and two small, light A tents, would be a good combination. It is very important that both light and heavy-weight tents be included in the outfit, the former for traveling and prospecting and the latter for use when a stop of any duration is made. The heavy tent is practically a necessity for camping on the ocean side of the passes leading to the headwaters of the Yukon, where it requires something considerably above the average to keep out the continual soaking rain, and it is also very desirable for occupancy at the time of going into winter quarters. Such tents retain the heat very much better than light-weight ones. And if the peak is low and the base banked with earth or snow, one can be perfectly comfortable in them in the coldest weather, while the cabin is building.

During the latter part of November and first of December we were very comfortable in a tent at a time when the thermometer for a good many consecutive days hung between the 50s and 60s below zero. The sides and back of the tent were banked with snow and the roof was covered with extra canvas. We had selected a spot in a dense growth of small spruce trees with low-reaching boughs, where we were completely sheltered from the wind. The first twenty-four hours the tent was somewhat chilly, for it took that length of time to thaw out the intensest rigor of the poles and base logs and surface of the ground; but after that we could get the place as warm as the hot room of a Turkish bath by the scientific firing of our little Yukon stove. The greatest hardship was starting the fire in the morning. I often went to bed with my gloves on and extra drawers outside my pants (for I like to be comfortable,

and I was comfortable, and never lost any sleep worth mentioning; but starting that fire involved the exposure of the nicely warmed upper portion of my body and the baring of my hands. Shavings had been prepared the night before, and all that was necessary was to throw down the blankets, roll over on my elbow, light a candle (for it was dark, and we would never have gotten up if we had waited for broad daylight), open the stove door, push in the shavings and kindling, and apply the flame of the candle to the draft hole in the front. Then I would roll back again into bed and cover my head with the blankets and blow my numbed fingers to start the circulation for a while, till I thought the fire was well under way, when another sortie was in order for the purpose of adding more wood. Soon the stove would be puffing away like a locomotive engine, and the draft cover on the front rattling at a lively gait, and we knew that our faithful little friend was a glowing cherry red on the firebox end, and that we could get up and undress for breakfast with perfect comfort.

In cold weather we reversed the usual process—dressed to go to bed and undressed for breakfast. Our heaviest clothing was reserved to sleep in. Much less was required when exercising outdoors or sitting in the heated tent.

On our sledge journey out to the coast we had to travel without stove and tent, because we had made the mistake of not providing a light-weight tent that could be carried without overburdening ourselves too much.

The chief discomforts of this journey, which lasted a month, were not being able at any time to get thoroughly warmed up by external heat—a luxury which one must be deprived of to fully appreciate—and not being able to bake bread or cook other dishes very satisfactorily. I had enough of flapjacks and grease cakes and frying-pan bread in that month to last my natural lifetime, and never want to travel again without some kind of a baker.

The peaked A tents may be built very light, and at the same time shed the rain fairly well, on account of the steep pitch of the roof. I saw one 7ft. tent, made of some oiled material—linen, I think—that the owner told me only weighed 7lbs. Most oiled tents are heavy, but this one was not, and seemed to be just about as near perfection as could be, for it was waterproof and windproof.

In summer the roofs of wall tents are sometimes painted black. This is to enable the occupants to sleep, for for several months it is daylight in the Klondike region practically the twenty-four hours. Wall tents and A tents should be constructed with a rope along the peak, so that they may be pitched without the use of a ridge pole if desirable. Sometimes standing trees may be utilized for pitching tents so arranged, and under any circumstances the problem is very much simplified. Near the summits of the passes ridge poles cannot be obtained, and if used have to be packed several miles.

The stove which is all but universally used in this country is one originated in Juneau, but obtainable now at any of the outfitting points on the Pacific coast. It is known as the Yukon stove, and though built in a great variety of sizes and styles, conforms in the main to one general pattern. This is a sheet-iron stove about twice as long as it is broad or deep, without legs, and having a firebox at the front and oven with over and under draft at the rear end. The best stoves are asbestos lined. Some are made to fold for convenience in carrying. The smaller sizes weigh about 25lbs., and the price is in the neighborhood of \$5. Parties coming up the river on the ice during the winter often knocked out the partition separating the oven from the firebox, making the stoves lighter and permitting the use of longer wood. These stoves were only used for heating the tent, and all that was desired was a mere shell that would hold the fire and conduct the smoke outside. They were very light, and I saw one that only weighed 8lbs., including the stovepipe. Stovepipes are often made to telescope and fit inside the oven or firebox. These pipes, however, are generally small, and sometimes in a day or two become clogged with soot and refuse to draw. The larger sizes are more satisfactory.

Another style stove (procured by our party in Victoria) had for the oven a drum-shaped affair interpolated between the first two joints of the stovepipe. This gave more fire space and was an advantage in many respects, but the combination was a nasty thing to pack, and I would never choose such a stove for use when traveling.

It is well to make sure when buying your stove that you have enough pipe to go up through the roof of your tent. It sometimes happens that not enough is supplied, and lacking it stakes must be driven into the ground for supports, or some similar arrangement made.

There was a vast variety of opinions on the trail as to the position the stove should occupy in the tent. In the smaller tents the stove was frequently set up directly in the middle of the tent, just inside the door. One of the front corners of the tent, however, was more frequently chosen. Stones are generally used to raise the stove up from the ground. Some support is required, for otherwise the firebox will set fire to the vegetable matter in the ground underneath.

The mess kit and cooking utensils supplied with the Buzzacott outfit are of particular value to the Klondiker, for they are easily packed and are arranged to nest in the least possible space. Lacking these, the cooking outfit is frequently carried in a wooden mess box. Often there is a set of nesting pails arranged to fit the oven of the stove. At times when even the slightest weight is a serious objection, as in sledging parties, the mess box is done away with and the utensils carried in a sack. The outfit should include three or four granite ware covered buckets—four, six and eight-quart—and at least two frying pans. A good, big mixing pan for bread making is also desirable, though it is possible to get along by using a gold pan instead for this purpose.

As for supplies, beans, bacon, flour and tea are the staples. Almost as essential are sugar, salt, baking powder and dried fruits. Then come oatmeal, rice, cornmeal, evaporated potatoes and onions, raisins (a good thing—25lbs. are enough for a year).

Soup extracts, including desiccated vegetables, con-

densed milk (evaporated cream is good, but spoils after being frozen), canned butter (get the 2lb. hermetically sealed tins), coffee and cocoa, smoked beef, hardtack and dry salt pork. Many other things may of course be added, but most of the above articles are essential.

The Canadian Mounted Police had an oatmeal biscuit prepared for dogs that was mighty good eating for men. It did not freeze, and was just the thing for lunch on a winter's day. Then there was a kind of egg powder, put up in Seattle, that struck me as being a good thing, though I did not have a chance of trying this.

The hardtack should be put up in 5lb. tins; the salt, sugar, tea and coffee in oiled waterproof sacks or tins; and the fruit should also be similarly protected. In fact oiled sacks are good for all the articles named. A wetting is more to be feared for the sugar than any other one article, for no matter what precautions are taken afterward it is sure to continue to lose weight by leaching. It is bad enough with salt, but salt can be dried. Flour never wets through, and in a 50lb. sack only 5 or 6lbs. is caked by an all-round wetting. This caked flour may be eaten, though it is of course impossible to get baking powder into it or bake raised bread. Oatmeal and cornmeal sour after a wetting, and beans must be dried before they swell. Fruit may be saved by drying within a reasonable time. Properly cured bacon can stand repeated wettings without deteriorating in quality. The baking powder requires especial care, as it is very susceptible to the presence of moisture and easily loses its leavening qualities.

For bedding furs should always be taken. One can get along in summer very well with blankets, but they will hardly answer for the intense winter cold. I have slept between 60lbs. of good quality blankets and had to wear gloves to keep my hands from freezing. In that Arctic cold blankets seem porous, "like so much mosquito netting," as Frank Slavin expressed it, and adding to the pile over you seems to do very little good. If a man relies on blankets alone he must pack around a tremendous weight of them when traveling in winter, and more blankets means less food.

Fur robes, on the other hand, possess the maximum of warmth with the minimum of weight. The skins of the smaller animals, such as lynx, fox, badger, wolf and rabbit, are preferred to such heavy skins as those of bear, deer or buffalo. Lynx and rabbit skin robes are perhaps held in the highest esteem. The latter is the lightest of all furs. The rabbit skin robes were procured from Indians through the Hudson's Bay Company. They were made of the skins of the Northern hare, cut into narrow strips and woven together double, in such a way that the fur faced outward on both sides. One can push his fingers through these robes anywhere, and yet they seemed effectually to keep out the cold. The owners assured me that they were comfortable "lying out" in 50-below weather, and other members of the parties with which they traveled said that these men never seemed to mind the cold at night, and slept better than any one else.

At first I could scarcely credit this, as the robes were very light (a 6ft. square robe weights only 9lbs.), and often they were neither covered nor lined, and it seemed as though the cold could easily penetrate the meshes; but after seeing them in use and talking with Hudson Bay men who had been accustomed to them all their lives, I had to change my opinion. The Hudson Bay men believe in using the robe without covering or lining, as they say it is warmer that way. They acknowledge, however, that if a man is at all particular as to his appearance this will not do, as the hairs come out in the worst kind of a way. Generally they are lined with blanket material, though in one case silk was used.

These rabbit skin robes are very cheap, but were hard to get in the Yukon last year. The cost is in the neighborhood of \$10. The lynx skin and other robes were much more expensive, the price varying of course with the primeness of the fur. Coyote skins make good robes, and these may be had at very reasonable prices.

The robe should be of good size. While one 6ft. square is large enough under some circumstances, a robe 6x9ft. or 8x9 is better. The Canadian Mounted Police require a robe 8x9ft. in size.

Sleeping bags are good for use under favorable conditions, but they are hard to dry out, and this is a serious objection in the Arctic climate of the Yukon. A single night will make the bedding very icy, for one has to sleep with his head covered, and the breath congeals. Blankets soon become as stiff as boards, and constantly gain in weight. Then too, when turning in for the night this ice in the bedding must be thawed out to some extent by bodily heat before the temperature inside becomes very conducive to sleep.

Waterproof sleeping bags of the best type, such as the Kenwood, are excellent for use in the fall, and at times when the thermometer does not drop much below zero.

In connection with the general outfit I should like to say a word in praise of the folding canvas boats we took along as a part of our outfit. While I should not recommend the use of such boats as freight carriers, on account of the necessity of mooring them off shore when the load is left in over night, I think they cannot be excelled for prospecting or hunting or trips where only a light outfit is carried. Canvas boats will stand an incredible amount of rough usage and banging on rocks, but a hole will very soon be worn through the bottom if they are left resting on a rock or with the bow drawn up on a gravelly beach. When they cannot be anchored out clear of the shore the boats must be unloaded and afterward carried up on the beach.

Our boats were a large size Eureka model, made by the Acme Manufacturing Co. They were only 12ft. long, but they had 44in. beam and were 23in. high, bow and stern. Amidships they were 15in. high. Eureka boats are built on a canoe model, and are excellent sea boats, and when not loaded too heavily they row very easily. We shot the Cañon and White Horse Rapids with these boats half decked, and carried from 350 to 450lbs. of freight. This load was necessary to steady the boats and keep them from tossing the rower out. With it they could be handled to perfection. The worst pitch of White Horse Rapids was avoided by running the boats into quieter water near the west bank. Our boats were the smallest that ever successfully shot these rapids,

and the only ones, I believe, that went through with a single occupant. The boats are very readily put together or taken apart, and two when folded may be packed on a horse's back at one time.

J. B. BURNHAM.

Sport in Spain.

Correspondence of Forest and Stream.

It has been said that the public taste for bull-fighting is dying out in Spain. I believe the opposite to be the fact! Among the first things I read in Madrid was an article about a project to bring an enormously large and powerful elephant from the Zoölogical Garden at Amsterdam to Madrid, and pit him against a tiger, a lion, a white bear, and against five bulls.

The town was covered with flaming posters of the approaching "corrida"—six bulls from the famous "ganaderias" (pasturages) of the lineal descendant of Columbus.

I know of no more magnificent spectacle than a bull fight. As to its morality, or its influence on a nation of amateurs at this sport—that for the moment I will not discuss.

Those who believe that the sport is dying out should see such crowds as Rennyson and I beheld streaming from "la Puerta del Sol," filling the wide avenue, "Calle Alcalá," and finding place in the circus with its room for 12,000 spectators. Everybody who can hire a wagon or a mule drives or rides at the greatest speed of which his animal is capable, in clouds of dust amid a hubbub of yelling.

The driver is seated on the shafts, his legs dangling among the mules, which he can conveniently whip; and in the carryall are as many boys and girls as can be seated, or hang on by their eyelids, chattering like magpies. It's a country circus and a Fourth of July multiplied by a thousand.

The mules and donkeys are decorated with all sorts of ribbons, tassels and streamers.

The day of the "corrida" is a holiday for everybody.

A peasant and his wife astride on muleback—he carrying his "escopeta" (gun) slung on the shoulder—are coming in from the country; others are on tiny little donkeys, the riders' feet almost scraping the ground, like the pictures one sees in illustrated Bibles of locomotion in Palestine; long wagons like hayricks, to which are harnessed six gayly and festively decorated mules; and such is the crush for seats that, to be sure of them, we took our tickets in advance.

Every ticket is numbered and every seat is "reserved"; there are six great doors, and the people take their places without confusion. When we arrived the arena was full of people who had been looking at the bulls in the "toril." A detachment of soldiers enters the arena, and executing a half pivot swing, sweeps the crowd out.

The bulls are suggestively bellowing; acquaintances are calling to each other across the arena, which is large enough for a regiment of cavalry to maneuver in; ladies are plying their fans, making a rustling, sibilant sound like 10,000 butterflies; students in groups are shouting their college songs.

One of their number asks a dignified old gentleman, just arriving, what time it is. He gives the hour, and they shout in chorus "Gracias," nearly startling the old fellow out of his wits, and everybody laughs—except the old gentleman.

A brass band discourses excellent music; hawkers throw oranges to purchasers in every direction, and deftly catch in their hats the "cuartos" thrown in payment. An orange goes astray, knocks off a man's silk hat; there is a grand general laugh, but the hatless one is furious.

The audience commences to pound with their canes; the students sing; "Time's up."

The "alcalde" (mayor), who presides, takes his chair in the box of the "Ayuntamiento" (City Councils) beside the Royal Box. A lady faints, and instantly the 12,000 people are on their feet, standing on the benches. A fellow with a speaking trumpet which makes a noise like a clap of thunder calls to a friend on the opposite side. Excitement runs high, the minute approaches, the noise is immense—a sullen roar—12,000 voices mingled.

The music ceases; at a trumpet sound four mounted, armed guards enter the arena and slowly ride round it, inspecting if all is right, every barrier closed, the ground in perfect condition.

Twelve thousand spectators look at the "alcalde's" box—the silence is absolute.

The band strikes up; the gate under the Royal Box opens, and the "cuadrilla," all the "toreros" in gala costumes, enter in procession.

They are greeted by an immense explosion of applause. First come the "primas espadas" (swordsmen) dressed like Figaro in the "Barber of Seville," followed by "banderilleros," "capeadores," "picadores" and "chulos." It would much exceed my limits to describe their costumes; every color and material, satin, silk, velvet, laces, fringes, ribbons, all increasing the harmonious effect.

I can imagine nothing more Olympian than their march around the arena. It was a blend of a military review, a band of masqueraders and cowboys. They march with military precision, stop before the mayor's box and salute. The "alcalde" throws down the key to the bull stalls ("toril"), and all go out of the ring, except the "picadores," mounted and armed with long lances, and some "capeadores," with their red and yellow capes. All eyes are fixed on the gate where the bull will enter—the silence is deathlike—the bulls below, the blindfolded horses tremble; the "picadores" show some anxiety and settle themselves more firmly in their saddles and poise their lances; the trumpet sounds, the gate opens, an enormous bull, head and tail erect, rushes into the arena, and 12,000 throats simply yell.

My friend Rennyson, who had never seen a bullfight, turned pale. I confess shivers chased each other up and down my back. The bull rushed like an avalanche at the first "picador," who stuck his lance in its neck, but did not stop it; the bull struck the horse amidships, lifted him and the "picador" bodily from the ground, tossed them lightly from his horns against the barrier, then

rushed at the second horse and the third with almost identical results. The three horses were killed in less than a minute. Then the bull ran out to the middle of the arena, horns and nose covered with blood, snorting, pawing, and looking at the people as if to say: "Anything more I can do for you?"

Everybody howled like a band of demons.

The "chulos" (servants) ran and helped up the wounded "picadores," took the saddles and bridles off the dead horses, and to save the "picadores" who are struggling to free themselves from the poor animals the "capeadores" run round the bull flaunting their red flags in his face, provoking and taunting; he runs after them in a whirlwind of dust, butts his head in his fury against the barrier, paws, bellows, again attacks the dead or dying horses, tries to fly over the barrier, and runs about frothing mad round the ring.

In the meantime other mounted "picadores" have posted themselves at intervals, and when the bull perceives them he rushes at them frothing with fury.

The "picador" jabs his lance into his shoulder and succeeds in holding him at bay. The bull leaves him and attacks the next horseman.

Thunders of applause reward the "picador's" successful resistance. The poor, disemboweled horses were disgusting to see.

At a trumpet call all the "picadores" gallop out of the ring, and "chulos" cover pools of blood with sand.

Now comes the poetry of bullfighting, if I may be allowed so to explain myself. I mean the "banderilleros." Their duty is to stick an arrow about 18in. long, and ribbon-decorated, having a barbed point, in each side of the bull's neck. To do this trick gracefully he posts himself about twenty paces in front of the "toro," and then by gesticulating with his arms provokes the animal, who rushes at him; the "banderillero" with lightning swiftness fastens an arrow in each side of his neck, and springs aside out of danger with the nimbleness of a panther.

Should his foot slip, or he miscalculate the distance or hesitate, he would be speared like a fish. The bull bellows with pain, snorts and jumps, pursuing his tormentors, who, running for their lives, clear the barrier and are safe. Another man with "banderillas" enters the ring, plants two more arrows, and after him a third man does the same; the bull, pursuing, jumps the barrier after his tormentors, and bellowing, screaming horribly, is in the corridor pounded with canes by the front seat spectators; then he runs round the corridor head up, looking at the crowd defiantly, and is at last chased again into the arena.

All the spectators stand up, and wildly gesticulating, yell like madmen. The "banderilleros" and "capeadores" renew the attack; one twists his tail, another blinds him by throwing his "capa" over his horns, a third using his lance as a spring pole jumps over the bull's back, then throws his lance at the animal's feet, in which it becomes entangled, and the bull snaps it like a pipe stem as he runs. All this was done with the grace of a dancing master, with the rapidity of a sleight-of-hand performer, while the people enjoyed, laughed and applauded. The "toro," now at white heat of exasperation, is considered "ripe for slaughter."

Now comes the solemn part of this barbarous spectacle.

The trumpet sounds, and the "prima spada" (swordsmen) enters the arena, having in the one hand the "spada," in the other the red flag attached to a stick, presents himself before the mayor's box, takes off his cap and makes the "alcalde" a speech in which he assures him of his homage and determination to kill the bull or die in the attempt.

Tossing his cap in the air, he advances resolutely toward the bull. Now is the struggle! A young man of perhaps twenty-five, dressed like a dancing-master, silk stockings and slippers, alone, with no defense but a small, thin sword, against the terrible brute with horns sharp as poignards, exasperated with pain, blinded by wrath, looking hideous, frightfully bloody. But the eyes of the vast, breathless, excited multitude are on him, and 6,000 pretty hands of the señoritas will applaud him.

The bull, head down, swift as an arrow, plunges at him, the "spada" jumps aside straight up in air, heels together, and is rewarded by thunderous applause. The audacious "torero" advances again, taunts the bull with his "muleta" (red flag), which he flaps around his head and between his horns, lets it fall and picks it up while the monster is charging on him; attacks the quadruped ten times, and each instance escapes certain death by a quick jump aside.

The supreme moment has arrived—the audience yells: "Que lo mate! Que lo mate!" (kill him!)

The "espada" stops, assumes a tragic pose, shakes his flag, holds his sword horizontally; a stillness of death reigns, the people appear as so many stones; the bull rushes; we see the silver flash of a sword, the poor thing staggers, falls on his knees, belching blood, and from every throat comes an infernal, unearthly yell, followed by deafening plaudits and cries of "Bueno! Viva!" The tumult is indescribable; all are standing up, gesticulating wildly; cries are universal; it is momentary insanity; the ladies wave their handkerchiefs, clap their hands; the band strikes up; the scene is past painting. The "spada" is again a hero!

The spectators throw him cigars, hats, canes, purses, opera glasses—anything they have in their hands. Preparations for the next slaughter are begun; nothing stops the "sport," not even the death of a "torero."

In this "corrida" we saw six bulls and twenty-one horses killed in the space of two hours and a half.

Rennyson was amused, frightened, disgusted. Near us were children with their mothers, who laughed, applauded and screamed with delight. Such sights would fill an American lady with supreme disgust, but drew the plaudits from the grand Spanish ladies who graced the occasion.

Who can analyze the matter psychologically? You are horrified beyond measure with the atrocious brutality of killing the horses; you are astonished and delighted with the beauty of the display, and the wondrous agility, the charming fearlessness of the performers; you feel as if you would faint when seeing the blood of the disemboweled horses; you yell and applaud the marvelous courage, the matchless dexterity,

the "spada," who faces and dominates an enraged animal who kills a lion, a leopard, or a white bear.

Like poets, "toreros" must be born, not made, if you will pardon such dusty platitude. The "primas padas" are the nerves of the nation. They are better paid than their Secretary of the Treasury, more popular with the people than their Premier, or their greatest orator; they are idolized by the ladies, bowed to by the society leaders; frequent the most select circles; are received at court; they have their carriage and splendid horses; their photographs, oil paintings and statues are displayed everywhere in the shops, placed on fans, figure on handkerchiefs. They are the true heroes of Spain.

Explain it for me if you can, for to my mind the enigma is complete.

I asked my friend Rennyson what he thought about it. "Don't let's talk about it, for I am disgusted, wearied out, and feeling as if I wanted to sleep for about two weeks." Such was the expression of feeling on his part.

MAJOR W. W. HASTINGS.

A Letter from Lake Okeechobee.

OKEECHOBEE—"Great Water"—is well named, for while of comparatively limited area, in appearance it is almost boundless. Three-fourths of its shores are fringed with a belt of saw grass varying from one to six miles wide; the other fourth of the lake shore is composed of a dense forest of cypress, the water flowing freely through grass and among trees until it is hard to say where land stops or lake begins. We have sailed entirely around the lake, and have found very few places where one can land dry shod.

There seems to be an abundance of fish. Big-mouth black bass, goggle-eye perch and bream, and leather-back turtle, are in evidence, while gators are an unknown quantity. I had a little experience with one of the biggest the other day. Perhaps I'd better tell you about it.

It was over in Chezy Bay. I had paddled across and up into a little cave among some large cypress trees. The water was quite deep, but everywhere covered with a dense growth of the cow lily. I had forced the canoe well into the mass, when alongside, and not more than 6 ft. from the canoe, there came to the surface the largest alligator I have ever seen. He came up very slowly, parallel to the canoe. As his eyes came to the surface he saw me, and slowly milled around until his head was pointing to the bow of the canoe; then he began to swell up and rise still higher out of water. His size was enormous, and I think his girth would equal that of a large ox. I had a large double gun loaded with heavy shot. I reached for the gun; then I stopped to think. My thoughts were something like this: "I can lift the top of your head with one barrel, and then you'll kick; and then where will I be? If I should escape getting my back broken I couldn't swim in all this tangle of lily pads." And I very quietly left the gun alone, took my paddle, and very, very carefully backed out of the vicinity. Perhaps that was not just the way to do, but I have always been satisfied it was best.

I have seen but few birds around the lake; beyond a few rookeries of cormorants there is a dearth of bird life. Deer and turkeys are fairly plenty now, and a few hummock and cat squirrels.

Altogether my impressions concerning the lake are disappointing.

One thing we certainly had a surfeit of, and that was rough water. I have done a good bit of sailing in my time, and I am of the opinion that Okeechobee can get up the meanest and nastiest little chop sea, and can do so on the least provocation, of any body of water twice the size that I am acquainted with.

All of which reminds me that I must tell you of how we made our last harbor on the lake. We had been running for some time before a strong easterly wind; a good breeze at first, it had gradually increased until at sunset it was blowing half a gale. We were looking for shelter. Ahead and on either bow was a heavy cypress forest. We thought to run in as close as possible, anchor, and ride it out. As we neared the trees we discovered an opening and decided to run in if we could get in. We were soon at the little gap, and driven by the now furious wind dashed in between two immense trees, with room enough, but none to spare. But the old man was at the helm, S. was on the bow, and Charley was shaking in his shoes. It was terribly exciting for a moment. No one knew how much water was under us, no one knew how many roots and stumps were in our way; but on we drove. "Luff!" luff it is! "Steady! steady! Keep off—hard up—stand by for a jibe!" And presto! all was still as death. We had run out of a furious gale into a perfect little basin, surrounded on all sides by tall trees, its waters scarcely rippled by a breath of the storm king that so furiously howled outside.

"Down jib! Let go anchor! Down mainsail!" And here we are, in as perfect a little harbor as ever gladdened the heart of a storm-tossed sailor.

All through that night we could hear the wind howl outside. The thunder and lightning was almost incessant, while the rain fell in torrents; but we were safe. After supper and the usual smoke, with a story or two thrown in, we sought our little beds, and if we did not sleep much we rested safe and secure in our little tree-sheltered harbor.

With the morning came fair weather, and with a cordial good-by to our little haven we stood down the lake for the canal and home.

TARPON.

MANY readers of the Post are personally acquainted with the venerable Samuel Sanders, of Schrono, who is one of the old-time hunters and trappers. Mr. Sanders, who is a blacksmith by occupation, has in the course of his long life made 126 bear traps and caught or killed 92 bears. As a maker of bear traps he stands at the head among Essex county blacksmiths, and as a bear trapper he ranks next to our peerless Elijah, who is spending the happy evening of a hunter's life under the shadow of Mt. Raven, after having killed 150 bears.—*Elizabethtown, N. Y., Post.*

Natural History.

Audubon and His Journals.*

NEARLY fifty years have elapsed since the death of the great artist-naturalist who is undoubtedly the most widely known of the ornithologists of America; and until now no adequate history of his life has ever been written. Two lives of Audubon have been published, both being incorrect, inadequate and so unsatisfactory. We have now, thanks to the naturalist's granddaughter, Miss M. R. Audubon, a life which is as complete as anything we can ever hope to have, and which shows us, after the lapse of all these years, not so much Audubon the naturalist, the artist or the traveler, as Audubon the man.

The material comes to us almost exclusively from his own writings, and chiefly from journals kept by him, in which the happenings of his life were set down from day to day during his absence from his family for perusal by his beloved wife and later by his sons. These journals together with a great mass of other material have been brought together with loving labor and untiring industry extending over several years by Miss Audubon, and the material has been used by her with rare judgment and with most effective skill, and so she tells us the story of her grandfather's life.

The year of Audubon's birth is usually given as May 5, 1780, though it is probable that the real date is earlier. He was born on the plantation of Mandeville, on the north shore of Lake Pontchartrain, in Louisiana, his father being a French admiral, and his mother a Spanish creole. He lost his mother early in life, in one of the local uprisings of the slaves in Santo Domingo, and was early taken to France, where his father was in active service. As a boy he was tenderly cared for and greatly spoiled by his stepmother, for whom he always felt the warmest affection, and who is constantly mentioned in his writings. Happily his father was of sterner mould, and learning at last how completely the boy was his own master sent him away to school.

When about eighteen years of age, the troubles of France led to his being sent to America, where he took possession of a farm known as Mill Grove, which be-

JOHN JAMES AUDUBON.

longed to his father. Here his time was spent in shooting, fishing and athletic exercises, and it was here that he met Lucy Bakewell, whom he married a few years later, and who survived him for many years. Unquestionably a great part of Audubon's success in life was due to the steadfastness with which he was believed in, encouraged and assisted by that noble woman.

Some of the best years of Audubon's life were ostensibly devoted to commerce, and it was often his part to furnish the capital for various enterprises where other people attended to the business. The results of this course to Audubon's pecuniary fortunes were disastrous. The naturalist in fact spent much of his time in the forest, studying the birds that he was afterward to paint and to write about. He had no taste for business, he had even no interest in it, except so far as the making of money was necessary to the comfort of his dear ones.

It was in the spring of 1826 that Audubon sailed for England to set on foot, if possible, the publication of his great work on birds. His success there is well known, and is delightfully told in the journals which begin this work, for most of the earlier volumes of Audubon's journals have been lost. But the European journal from 1826-29, the Labrador journal, 1833, and the Missouri River journals, 1843, remain to us, and are given here, illustrated with many hitherto unpublished portraits of the naturalist, and together with two of Madam Audubon and two each of his two sons, pictures of his residences and unpublished sketches of the birds that he drew.

Following the Missouri River journal are to be found the episodes which are printed in the original edition of the "Birds of America," together with one that has not been before printed.

Much of the material found in the journals, bearing on the habits of birds and mammals and on various sections of this country, is of course found also in the works on birds or the quadrupeds of North America, since in these journals are inscribed the field notes from which the volumes were written. The material is abundant, and it is all quotable. We take from the Missouri River journals (August, 1843) a few paragraphs about the buffalo in those days:

"Although I have said much about buffalo running, and butchering in general, I have not given the particular manner in which the latter is performed by the hunters of

* Audubon and His Journals, by Marie R. Audubon, with zoölogical and other notes by Elliott Coues. 2 vols., illus. Chas. Scribner's Sons.

this country—I mean the white hunters—and I will now try to do so. The moment that the buffalo is dead, three or four hunters, their faces and hands often covered with gunpowder, and with pipes lighted, place the animal on its belly, and by drawing out each fore and hind leg fix the body so that it cannot fall down again; an incision is made near the foot of the tail, immediately above the foot in fact, and the skin cut to the neck, and taken off in the roughest manner imaginable, downward and on both sides at the same time. The knives are going in

MADAM AUDUBON.

From the Audubon Magazine.

all directions, and many wounds occur to the hands and fingers, but are rarely attended to at this time. The pipe of one man has perhaps given out, and with his bloody hands he takes the one of his nearest companion, who has his own hands equally bloody. Now one breaks in the skull of the bull, and with bloody fingers draws out the hot brains and swallows them with peculiar zest; another has now reached the liver, and is gobbling down enormous pieces of it; while perhaps a third, who has come to the paunch, is feeding luxuriously on some to me disgusting looking offal. But the main business proceeds. The flesh is taken off from the sides of the boss or hump bones, from where these bones begin to the very neck, and the hump itself is thus destroyed. The hunters give the name of "hump" to the mere bones when slightly covered with flesh; and it is cooked, and very good when fat, young and well boiled. The pieces of flesh taken from the sides of these bones are called filets, and are the best portion of the animal when properly cooked. The forequarters, or shoulders, are taken off, as well as the hind ones, and the sides, covered by a thin portion of flesh called the depouille, are taken out. Then the ribs are broken off at the vertebrae, as well as the boss bones. The marrow bones, which are those of the fore and hind legs only, are cut out last. The feet usually remain attached to these; the paunch is stripped of its covering of layers of fat, the head and the back bone are left to the wolves, the pipes are all emptied, the hands, the faces and clothes all bloody, and now a glass of grog is often enjoyed, as the stripping of the skins and flesh of three or four animals is truly very hard work. In some cases when no water was near, our supper was cooked without our being washed, and it was not until we had traveled several miles the next morning that

JOHN WOODHOUSE AUDUBON.

From the Audubon Magazine.

we had any opportunity of cleaning ourselves; and yet, despite everything, we are all hungry, eat heartily, and sleep soundly. When the wind is high and the buffaloes run toward it, the hunters' guns very often snap, and it is during their exertions to replenish their pans that the powder flies and sticks to the moisture every moment accumulating on their faces; but nothing stops these daring and usually powerful men, who the moment the chase is ended leap from their horses, let them graze, and begin their butcher-like work."

"Mr. Culbertson tells me that these animals can endure hunger in a most extraordinary manner. He says that a large bull was seen on a spot half way down a precipice, where it had slid, and from which it could not climb upward, and either could not or would not descend; at any rate, it did not leave the position in which it found itself. The party who saw it returned to the fort, and on their way back on the twenty-fifth day after, they passed the hill and saw the bull standing there. The thing that troubles them most is crossing rivers on the ice; their hoofs slip from side to side, they become frightened and stretch their four legs apart to support the body, and in such situations the Indians and white hunters easily approach and stab them to the heart or cut the hamstrings, when they become an easy prey. When in large gangs, those in the center are supported by those on the outposts, and if the stream is not large, reach the shore and readily escape. Indians of different tribes hunt the buffalo in different ways; some hunt on horseback and use arrows altogether; they are rarely expert in reloading the gun in the close race. Others hunt on foot, using guns, arrows or both. But I will give you the manner pursued by the Mandans. Twenty to fifty men start, as the occasion suits, each provided with two horses, one of which is a pack horse, the other fit for the chase. They have quivers with from twenty to fifty arrows, according to the wealth of the hunter. They ride the pack horse bare-back, and travel on till they see the game, when they leave the pack horse and leap on the hunter, and start at full speed, and soon find themselves amid the buffaloes, on the flanks of the herd, and on both sides. When within a few yards the arrow is sent, they shoot at a buffalo somewhat ahead of them, and send the arrow

the leader of the herd will be restless at the sight of the precipices, and if the fence is weak will break through it, and all his fellows follow him, and escape. The same thing sometimes takes place in the pen, for so full does this become occasionally that the animals touch each other, and as they cannot move the very weight against the fence of the pen is quite enough to break it through; the smallest aperture is sufficient, for in a few minutes it becomes wide, and all the beasts are seen scampering over the prairies, leaving the poor Indians starving and discomfited. Mr. Kipp told me that while traveling from Lake Travers to Mandans, in the month of August, he rode in a heavily laden cart for six successive days through masses of buffaloes, which divided for the cart, allowing it to pass without opposition. He has seen the immense prairie back of Fort Clark look black to the tops of the hills, though the ground was covered with snow, so covered was it with these animals; and the masses probably extended much further. In fact it is impossible to describe or even conceive the vast multitudes of these animals that exist now, and feed on these ocean-like prairies."

Audubon's expedition to the mouth of the Yellowstone was made for the purpose of collecting the materials for the "Quadrupeds of North America," the joint work of himself and his two sons together with Dr. Bachman. The record of this trip, except as it appears in the "Quadrupeds," was wholly lost until the summer of 1896, when it was discovered by Miss Audubon and her cousin Miss M. E. Audubon in the back of an old secretary. The value of the discovery can hardly be overestimated.

After his return from the Missouri River trip, Audubon

in an oblique manner, so as to pass through the lights. If the blood rushes out of the nose and mouth the animal is fatally wounded and they shoot at it no more; if not, a second and perhaps a third arrow is sent before this happens."

The method of capturing buffalo in pounds, by Blackfeet, Gros Ventres and Assinaboines—the primitive Indian way—is given in the following language:

"These pounds are called 'parks,' and the buffaloes are made to enter them in the following manner: The park is sometimes round and sometimes square, this depending much on the ground where it is put up; at the end of the park is what is called a precipice of some 15 ft. or less, as may be found. It is approached by a funnel-shaped passage, which, like the park itself, is strongly built of logs, brushwood and pickets, and when all is ready a young man, very swift of foot, starts at daylight, covered over with a buffalo robe and wearing a buffalo head dress. The moment he sees the herd to be taken, he bellows like a young calf and takes his way slowly toward the contracted part of the funnel, imitating the cry of the calf at frequent intervals. The buffaloes advance after the decoy; about a dozen mounted hunters are yelling and galloping behind them, and along both flanks of the herd, forcing them by these means to enter the mouth of the funnel. Women and children are placed behind the fences of the funnel to frighten the cattle, and as soon as the young man who acts as decoy feels sure that the game is in a fair way to follow to the bank or precipice, he runs or leaps down the bank, over the barricade, and either rests or joins in the fray. The poor buffaloes, usually headed by a large bull, proceed, leap down the bank in haste and confusion, the Indians yelling and pursuing till every bull, cow and calf is impounded. Although this is done at all seasons, it is more general in October and November, when the hides are good and salable. Now the warriors are all assembled by the pen, calumets are lighted, and the chief smokes to the Great Spirit, the four points of the compass, and lastly to the buffaloes. The pipe is passed from mouth to mouth in succession, and as soon as this ceremony is ended the destruction commences. Guns shoot, arrows fly in all directions, and the hunters being on the outside of the inclosure, destroy the whole gang before they jump over to clean and skin the murdered herd. Even the children shoot small, short arrows to assist in the destruction. It happens sometimes, however, that

remained at his home on the banks of the Hudson River in New York until his death in January, 1851. Old residents of that section of the city still remember the tall, white-haired old man, and the romantic surroundings of his home.

The character of Audubon as depicted in these journals, and so revealed in the free, frank manner in which one would show himself to his immediate family, is very different from the estimate usually had of him. He is often represented as mercurial in temperament, vain, fond of display, careless and thoughtless of others. Certainly when writing of his daily life for his wife to read he shows none of these characteristics. Though passing easily from depression to cheerfulness, his naturally volatile character received the balance which it needed from his enthusiasm for nature and his great love for his wife. As a very young man he had a young man's faults, but as soon as the responsibilities of a family were assumed he grew in steadiness and in seriousness. Tender hearted he always was—ready to sacrifice himself to others and to empty his pockets on the relation of any plausible tale of woe. He was a character in fact of great sweetness and sensibility, childlike in his simplicity, in his enthusiasm and in his impulsiveness, an ardent worshipper of nature and passionately devoted to his family; but withal possessed of a singleness of purpose, which, after he had once discovered what was his real object in life, led him to press steadfastly onward to the goal toward which he had set his face.

It might not have been difficult for a biographer with this material before him to have injected into it so much of himself as materially to have changed the pleasing and the true picture found in these pages. Discretion such as has been shown in this task by Miss Audubon no doubt arose in part from her true appreciation of the character of her grandfather and her enthusiasm for his work. These gave her a keener eye and a sharper discrimination than might have been had by one who was not connected by blood with Audubon the naturalist.

In preparing this work Miss Audubon has had the valuable assistance of Dr. Elliott Coues, who has contributed many zoological and other notes which add much interest to one aspect of the work, and render it more complete.

The mechanical part of the book is quite beyond criticism.

The Wild Pigeon.

Our records of this species during the past few years have referred, in most instances, to very small flocks and generally to pairs or individuals. In The Auk for July, 1897, I recorded a flock of some fifty pigeons from southern Missouri, but such a number has been very unusual. It is now very gratifying to be able to record still larger numbers and I am indebted to Mr. A. Fugleberg, of Oshkosh, Wis., for the following letter of information, under date of Sept. 1, 1897: "I live on the west shore of Lake Winnebago, Wis. About 6 o'clock on the morning of Aug. 14, 1897, I saw a flock of wild pigeons flying over the bay from Fisherman's Point to Stony Beach, and I assure you it reminded me of old times, from 1855 to 1880, when pigeons were plentiful every day. So I dropped my work and stood watching them. This flock was followed by six more flocks, each containing about thirty-five to eighty pigeons, except the last, which only contained seven. All these flocks passed over within half an hour. One flock of some fifty birds flew within gun shot of me, the others all the way from 100 to 300 yds. from where I stood." Mr. Fugleberg is an old hunter and has had much experience with the wild pigeon. In a letter dated Sept. 4, 1897, he writes: "On Sept. 2, 1897, I was hunting prairie chickens near Lake Butte des Morts, Wis., where I met a friend who told me that a few days previous he had seen a flock of some twenty-five wild pigeons and that they were the first he had seen for years." This would appear as though these birds were instinctively working back to their old haunts, as the Winnebago region was once a favorite locality. We hope that Wisconsin will follow Michigan in making a close season on wild pigeons for ten years, and thus give them a chance to multiply and perhaps regain, in a measure, their former abundance.

In FOREST AND STREAM of Sept. 25, 1897, is a short notice of "Wild Pigeons in Nebraska," by W. F. R. Through the kindness of the editor he placed me in correspondence with the observer, W. F. Rightmire, to whom I am indebted for the following details given in his letter of Nov. 5, 1897: "I was driving along the highway north of Cook, Johnson county, Nebraska, on Aug. 17, 1897. I came to the timber skirting the head stream of the Nemaha River, a tract of some forty acres of woodland lying along the course of the stream, upon both banks of the same, and there feeding on the ground or perched upon the trees were the passenger pigeons I wrote the note about. The flock contained seventy-five to one hundred birds. I did not frighten them, but as I drove along the road the feeding birds flew up and joined the others, and as soon as I had passed by they returned to the ground and continued feeding. While I revisited the same locality, I failed to find the pigeons. I am a native of Tompkins county, N. Y., and have often killed wild pigeons in their flights while a boy on the farm, helped to net them, and have hunted them in Pennsylvania, so that I readily knew the birds in question the moment I saw them." I will here take occasion to state that in my record of the Missouri flock (Auk, July, 1897, p. 316) the date on which they were seen (Dec. 17, 1896) was, through error, omitted.—Ruthven Deane, in Auk.

Wild Pigeons of the Northwest Coast.

CHAMPOEG, Ore.—Editor Forest and Stream: In your issue of March 26, about wild pigeons: Would say they have not all gone the way of the buffalo, as they arrive here in good numbers during the month of May and stay with us until November. I have seen flocks with from 200 to 300 birds together, and I killed upward of 150 last fall. Their principal food here is berries, of which their favorite is the salmon berry, although they eat all kinds of berries, as well as grain. We can always kill enough to go around at the numerous mineral springs which abound in the Willamette Valley, when they are here. When they leave us I do not know where they go, neither do I believe they breed here, as I have never found their nests or young ones.

CAPT. JACK.

[The bird here described is not the passenger pigeon, commonly known in books as the wild pigeon (*Ectopistes migratorius*), but the band-tailed pigeon (*Columba fasciata*), a bird common on the Pacific slope, but extending eastward into Colorado.]

An Adirondack Wildcat.

A BOONVILLE, N. Y., reader sends us this story from the March number of the Northern Tribune: "For the first winter in many years wildcats have been numerous along the Fulton Chain. Bill Harwood, an old-time Adirondack guide, was around last week with his head and arms done up in bandages, as evidence of the willingness of a wildcat to fight when in close quarters. Harwood and his big deerhound Spot had been making a tour of the lakes for winter game when they were caught in a snowstorm on Black River Mountain near Rocky Point. They camped for the night in a shack left by a party of surveyors. Along in the morning Harwood was awakened by the barking of the hound. Turning over in his blankets he saw the shining eyes in a corner of the shack. Harwood knew it was a wildcat. The cat had crawled to the entrance when the hound leaped ahead and blocked the way out. A terrible battle followed. The cat leaped for the hound and literally tore the dog in shreds. Then the decayed trees holding the shack fell over the entrance and the cat and Harwood were literally penned in to fight a duel to the death. The odds were plainly with the cat, for Harwood's gun had fallen with the brush outside the shack. He was crawling to reach the weapon when the cat came down upon him, tearing its claws through his face and down his right arm. If the cat had followed the attack immediately the battle would have been over there and then. Harwood's life was saved by luck and a clever idea. As the cat leaned back for a second attack Harwood fell forward. His hands struck a box of red pepper, which he had brought with his provisions. Quick as thought he snatched a handful of pepper, and arising threw it at the head of the cat. The aim was good. The cat was blinded until Harwood could crawl outside and reach his rifle. Then he dropped under the edge of the shack, and locating the cat by the noise, fired until the animal was dead."

Range of the Mountain Sheep.

At various times in past years I have called on readers of *FOREST AND STREAM* to give me information concerning the range of the white goat (*Oreamnos*) and the prong-horned antelope (*Antilocapra*), and the distribution of these two species has been indicated on maps printed in the *FOREST AND STREAM*. For many of the data, for these maps I have been indebted to correspondents whom I have never met.

I now beg the assistance of your readers for some facts bearing on this same subject of present distribution in connection with the mountain sheep, and shall be very grateful to each one who may be willing to send me anything on this subject.

What I desire from every individual familiar with the species is a series of dates—as close as possible—telling when and where he has observed mountain sheep from the year 1890 to the present time; the locality of each observation should be given as exactly as possible, it being understood that the precise locality will not be published, nor publicly given in any form which will enable hunters

Number seen.

How often?

Character of country as to—

(a) Roughness.

(b) Aridity.

(c) Timber.

What is known as to summer and winter ranges?

Have any been killed recently?

Are they much hunted?

With this letter I am asking the *FOREST AND STREAM* to print a blank map of the Western country, and on this map I would ask each correspondent who may be willing to interest himself in the range of the mountain sheep to indicate, by a black dot, each locality where he has observed this species. Each mark so received will be transferred to a general map, to be printed later in an article giving the results of this inquiry.

As has often been said, data such as I am requesting from readers of the *FOREST AND STREAM* are of the utmost importance to naturalists. The rapidity with which our large game is disappearing makes it extremely desirable that records such as these should be set down without further delay. Knowing the interest felt in such

mittee; and the Treasurer's statement, showing the balance in the society's treasury to be \$37,862.66. The total subscriptions to the fund for building and collections amount to \$103,550. The membership of the society at the date of publication of this report was 600, and it is confidently believed that before long this number will be multiplied several times.

Three communications have a place in the report: The London Zoölogical Society and its Gardens, by W. T. Hornaday; A School of Animal Painting and Sculpture, by Ernest Seton Thompson; and the Destruction of our Birds and Mammals, by W. T. Hornaday, recently noticed in these columns. The whole report is one of very great interest.

Game Bag and Gun.

[On the Pickerel River.

MILTON, Ont.—As I was somewhat under the weather last October, and believed that what I needed was an outing in the woods, I set out about the middle of the month, in advance of the party with which I have hunted deer during a number of seasons, and took up my quarters in a backwoods hotel on the road to our camp on the Pickerel River, in the Parry Sound District, Ont. I brought with me my shotgun and fishing tackle, and put in the time until the end of the month shooting ruffed grouse and angling for black bass and pickerel. As birds were less plentiful than usual, owing to a cold, wet spring, which had killed off the young ones, and as it was rather late in the season for bass fishing, I did not get enough of either to claim a record or to earn the name of fish or game hog. But I put in the time very pleasantly, and was able to express a couple of dozen birds home.

Incidentally I looked after the preparation of a hunting camp, ten miles from the hotel, by two sons of a settler with whom we had stored our outfit after our previous season's hunt. They put a new roof on one of the smaller buildings of a deserted lumber camp, covering it with tarred paper; built bunks against the walls; made a dining table; and set up a sheet-iron stove.

On the evening of Oct. 29 the rest of my party arrived at our hotel, after a tramp of thirteen miles from Ah Mic Harbor, where they had landed from the steamer. Our supplies and baggage were brought thence in a wagon, but the roads were too bad and rough for comfortable riding. Our party included Ed and John, my old-time hunting companions; Johnston, who had been with us in 1895; my son Kenneth, who had made his debut in 1896, in his sixteenth year; and George and Fred Hewson. The Hewson brothers were new additions to our party, George being an experienced hunter and Fred a novice.

We remained at our hotel over night, and set out for camp early next morning. We reached the shanty in due time, and our eyes were gladdened by an examination of the mud in a salt-lick which had been made by emptying into a slough the brine from the meat used by the timber men. The mud was one mass of deer tracks, but all appeared to be some days old, the smell of the tarred paper on the roof having apparently kept the deer away after it was put there.

By Monday morning, Nov. 1, when the season opened, we were ready for business, and as the weather was wet, left our dogs in camp and set out for a still-hunt. Kenneth got first blood. He, John and George went to a large beaver meadow about two miles from camp, and had just separated when a buck walked out in the open about 50yds. from Kenneth, who put a bullet through it behind its shoulders, and as it made off gave it another, which broke one of its hindlegs and brought it to a standstill. This should have been enough, but boy-like he fired again, put another ball close to his first, and brought the buck, a fair-sized one with a six-point head, to the ground. John and George turned in to help dress and hang up the deer. While the three were busily engaged at this, having laid their rifles aside, a doe and two fawns appeared. George was the first to get hold of a rifle. He got Kenneth's instead of his own, and let fly at the doe, which was standing broadside to him, about 50yds. away. He missed her clean, and she did not give him a second chance, but was out of sight in no time. George accounted for his failure by the fact that he had not used his own rifle; but the boys wouldn't have it that way, and laid it to buck ague. The question as to which it was remains unsettled.

No more deer were killed on that day, and as the weather cleared up and remained fine up to Saturday, we ran our dogs day after day; but we had indifferent luck, for the larger deer, instead of taking to the runways on which we had had good luck during former seasons, almost invariably went away from, instead of coming to, us. We saw a number of fawns which we might have shot, but according to our rule let them go and waited for something larger. Two does were killed on the runways, Fred getting one of them, and George bagged a third at his stand, but without the assistance of the dogs, which had not been near him. He heard the doe walking through the underbrush, finally saw it about 100yds. away, and dropped it with a bullet through its neck.

Ed was not far away, arrived on the scene just as George was bleeding the doe, noticed that the bullet had gone through a 4in. hemlock before landing in the animal's neck, and asked for an explanation. George had one ready. He said that his shot was no fluke; that when the deer appeared all he could see of her was part of her neck; that the only way to reach it was through the hemlock; that he had aimed at its center; and that the result was before them. This explanation was reported by Ed on reaching camp, and George was the recipient of numerous compliments on his ingenuity; but what puzzled the boys was why he had aimed to hit the part of the doe's neck which he could not see.

Saturday morning was very wet—so wet that we were late about starting; but finally I announced that I was going to still-hunt around a beaver meadow at another deserted lumber camp. George said he would go with

SKETCH MAP FOR RANGE OF THE MOUNTAIN SHEEP.

to reach the special sheep country of which the correspondent writes. In naming this country, he should give State or Territory, and county, and should especially give the name of the nearest stream draining the locality and of the larger river to which that stream is tributary. The numbers of sheep seen at each observation should be given with great particularity, and it should be stated whether the animals were seen more than once at any time, or on any trip, and whether they seemed abundant or few in number.

Something should be stated as to the character of the country where the observations were made. First, as to its roughness; is it a bad land country, or a prairie country, with high buttes, or a region of rocky mountain peaks? Second, as to its aridity; is it a country well watered or dry? Is the rain fall heavy or slight? Third, is it a timber country?

Incidentally, two other questions might be answered. Have any sheep been killed recently in the locality under consideration, and are they much hunted there?

We are all aware that within a few years the naturalists have announced that in America—instead of the single species that old hunters knew—four species of mountain sheep are found. These are *Ovis canadensis*, *O. dalli*, *O. nelsoni* and *O. stonoi*. It is not to be imagined that any large proportion of the hunters who may have observed mountain sheep will recognize the specific differences on which these forms are based, and with our present limited knowledge as to these the locality and the character of the country must be depended on to give hints as to which species is found there.

I repeat below the different points to which I urge special attention, but should be glad to have each correspondent give me, in addition to these data, as full an account as possible of the species as he knows it.

Mountain Sheep.

Ovis ———.

matters by many of the readers of the *FOREST AND STREAM*, I confidently look forward to receiving a great fund of information from them. I may add that any correspondent who will give the name and address of any friend or acquaintance familiar with the mountain sheep, who is not a reader of *FOREST AND STREAM*, is requested to do so, in order that I may send to such person a copy of this letter and the blank map which accompanies it.

GEO. BIRD GRINNELL.

NEW YORK, May 1.

Western Small Mammals.

In Publication No. 27 of the Field Columbian Museum Mr. D. G. Elliot, Curator of Zoölogy, gives an annotated description of the mammals represented in several collections made for the museum by W. W. Price, Dr. S. E. Meek, G. K. Cherrie and E. S. Thompson. These collections come from the States of Iowa, Wyoming, Montana, Idaho and California, and from varying localities, ranging from the coast up to mountain peaks of an altitude of 10,000ft., while others in Nevada and southern California represent peculiarly arid and desert regions. The collection comprised over 2,500 specimens, and in many cases species were represented by very large series—in one case, for example, by 416 specimens. Several new species and subspecies were found in this great collection, which Mr. Elliot here describes. The species represented in this collection are chiefly rodents, though there are a few insectivorous weasels, and one *Bassariscus*.

New York Zoölogical Society.

THE second annual report of the New York Zoölogical Society has just been issued. It is a handsome pamphlet of 143 pages, illustrated by a number of fine half-tone engravings and by three maps, one of which is a large folding sheet, colored and showing the situations chosen in the Park for the different animals to be exhibited. The volume contains lists of the board of managers, of the officers of the society, of the members; a resolution passed Oct. 6, 1897, in memory of the Hon. Wm. A. Stiles; the report of the executive com-

ine, and away we went through the rain. On reaching the meadow we faced the wind and skirted it, George taking one side and I the other, agreeing to meet at a point nearly a mile away, where the opening narrowed and was not more than 10 or 15 yds. across. We happened to approach it about the same time, and as we were doing so George jumped a six-point buck, which he could not see, and which crossed the narrows and ran toward me. It was pretty close before I could see it, and as I raised my rifle it stopped and snorted about 30 or 40 yds. away. I put a ball through its heart, and it dropped after running about 50 yds. George helped me to dress it and hang it up, and we went back to camp for dinner, agreeing that as tracks were plentiful we would return in the afternoon.

We did so, and Ed, John and Kenneth accompanied us. As the wind had fallen, we were able to hunt in any direction, and divided, John and Kenneth taking the course followed by George and me in the forenoon, and George, Ed and I going in the opposite direction. The meadow ended a short distance above us, and was divided from another by a neck of bush. George again did the dog act without seeing a flag. Just as Ed had entered the neck of bush we heard something coming from George's direction, and then a doe appeared running about 60 yds. away across his front; but as he heard something behind her he waited, and was rewarded by the sight of a very large buck with a ten-point head, which he thot through the heart, and which dropped within 100 yds.

On Monday, which was very raw and windy, we crossed the river, taking a brace of beagles with us to hunt the large tract of burnt rocks on the other side. The dogs ran deer after deer with no result as far as we were concerned, but Johnston, who had got tired of hounding without any luck, went off for a still-hunt by himself. He had got a mile or two from the rest of us, and was traveling against the wind, when he saw a very large buck with a twelve-point head standing in a gulley about 80 yds. away. He fired hurriedly and missed clean, but redeemed himself by following the buck up, getting another chance and killing him. There was no one to help him to hang up his meat, which he managed to do after about an hour's hard work. He made plenty of noise, but had gone a very short distance from the spot when he saw another buck about a hundred yards away in a thicket. He fired and the buck appeared to drop, but when Johnston reached the thicket he was astonished to find instead of a buck a doe, killed by a bullet through her spine. Johnston had seen nothing but the neck, and was unable to explain the result of his shot except by the fact that it was the rutting season.

On the same day John shot a doe which walked into range on the edge of the "burn," but the dogs had nothing to do with it.

Next morning we took out one dog and made for the beaver meadow, where Kenneth had shot his trick. The dog ran a fine buck, with an eight-point head, to Fred, who shot him through the kidneys, crippling him so that the dog caught him in a small water hole in the meadow and jumped on his back. Kenneth was close by and finished the buck by shooting him through the head.

The dog then took another track and went straight away, and nothing was left but a still-hunt. Ed was in luck again. He saw a deer, which disappeared at once. He mounted a log and was watching for it when another one, a large buck with a ten-point head, appeared, and he downed it by a shot through the shoulders. Two does were also killed, one of them by Kenneth, to whom it was scared by some one else as he was on his way to camp. As she was very close he put a ball through her neck and spoiled no meat.

I should have killed a huge buck on the same day if I had kept my wits about me; but I was taken by surprise. In climbing the side of a ridge in a timber slashing I had to walk over a lot of dry twigs, which cracked so loudly that I had no idea of getting close to a deer there; but on mounting the ridge I was astonished to see the buck about 100 yds. away, with his head down, looking straight at me and ready to jump as soon as he could satisfy himself as to what I was. Instead of raising my rifle slowly I forgot myself and brought it up with a jerk. The buck was under cover in about two jumps; and I had only a random shot at his flag and another ineffectual one as he crossed a small opening further on. He had a tremendous set of antlers, and his track corresponded with his big appearance. He went into a thick green bush, and though I tracked him for a long time and jumped him repeatedly I could never see him again.

We had now thirteen deer, and only one more to get to complete the number to which we were limited, two each. The next morning was very wet, and I went out for a lone still-hunt where I had been on the previous day. The rest of the party went to drag out deer, work from which I was excused, as I was not yet in good condition. I had not gone far before I started a buck and a doe together, but I saw nothing but their flags and did not get my rifle off. I circled on them several times and started them each time, but could not get a shot, and finally gave them up. I went further into the bush, and as I was picking my way through a swamp I saw a large buck about 75 yds. away, walking fast and evidently tracking a doe. I waited until there were no trees intervening, aimed behind his shoulder and fired. From the way he plunged I knew I had him, and let him go. He disappeared, and when I reached his track I could find no blood, but I tracked him about 100 yds. and found him stone dead, my bullet having gone through his heart. He was a beauty, with a particularly fine ten-point head, heavy and well-matched horns. He was too heavy for me to hang up, even if I could have found a sapling to bend down for a spring pole, which I could not in the swamp, and I worked a long time dragging him to some hard wood and yelling between drags for help. At last John and Johnston appeared. They said that they were two miles away when they heard me, and congratulated me on the strength of my lungs, seeing that I was weak otherwise. As we were so far from the road and the brush was so thick, we decided to drag the buck out at once, rather than wait to blaze a trail in order to find

him later. It was a weary trip, and took us two long hours, though Ed turned up to help us when we had got about half way, and we were all soaked to the skin.

This ended our third season at the best place for deer hunting that we have ever struck, and next day we had our deer and outfit brought out by two teams as far as the hotel, where we remained over night, and on Friday we reached Ah Mic Harbor in time to catch the boat for Burk's Falls. On arriving at the latter place and having our deer weighed at the express office we found that they were even heavier than we had expected. Ed's two bucks weighed 215 and 204 lbs. respectively, mine 210 and 140, Johnston's 201, Fred's 180, and Kenneth's 162.

I shall add a few remarks about Ontario's game laws as far as deer are concerned. They remain as in 1896: two deer per man, \$2 per license, two shipping tags with each license, hounding allowed, but no killing in water. Settlers in unorganized townships are allowed to get venison at any season for food only. The law works well as far as non-resident hunters are concerned; but the settlers and shanty men are in most places a law unto themselves. Local deputy game wardens do not meddle with them to any great extent, and are probably afraid to do so. Deer are said to be killed in the water in many places, and I may say that during our outing we repeatedly heard strings of ten or a dozen shots evidently fired over water, and in localities where we knew there were no hunting camps. Deer are killed by settlers to sell to unsuccessful visiting hunters. This is illegal, and is the cause of a great deal of mendacity on the part of the purchasers in fabricating stories with full particulars of the killing of each deer. Non-resident deputies should be sent in occasionally to watch the settlers.

The prohibition of the killing of deer in water works well with the non-resident hunters, who are watched very closely, and causes many an old-time canoe hunter to go home empty-handed. The result is that there is a strong agitation for its repeal. I hope and believe that this will be of no avail; but in my opinion, which is not confined to myself by any means, the Government should prohibit hounding. This would stop all killing in water, and further would reduce the number of fawns shot. I make the latter assertion on these grounds: I have had years of experience in hounding, and the result of it is that I believe that the men on the runways get a great many more chances at fawns than at full-grown deer, because when a buck is run by hounds he circles very little, and often goes straight for water; a doe circles more than a buck, and a fawn often hangs around one locality almost like a hare. On the other hand, during the rutting season, which is the hunting season in Ontario, the bucks move from place to place more than the other deer, and give the still-hunter many chances.

Advocates of a return to the old order of things argue that still-hunting is the most destructive of all methods, and that it is practically confined to backwoodsmen and professionals, as others are unable to practice it on account of the danger of losing themselves in the bush. I admit that the expert still-hunter can kill more deer than any other except the butcher in the canoe, but as the law stands he is restricted to two, and while many non-residents in the bush dare not leave the roads and trails lest they should go astray, this is not the case with all. No member of my party, for instance, ever sees the bush of the North except when he goes there to hunt deer, and it includes a schoolboy; but we can all strut through the wilderness without difficulty, and though we have made a practice of spending the most of our time on runways we have done the bulk of our killing season after season without the help of dogs. The hunter who must be guided to his stand when the hounds are about to be let loose, and led back to camp when the run is over, has no business in the deer forest, and should stay at home. No Government should legislate for his special benefit, and I hope ours will not.

W. P.

CHICAGO AND THE WEST.

A Jack Snipe's Nest.

CHICAGO, Ill., April 30.—We are about at the dead center of the season these days. May 1 is about the last day which even the most enthusiastic snipe hunter will allow to himself in the spring season. For over a week the birds have been pairing in this latitude. Ten days ago a gentleman who was shooting on the Kankakee marsh found a snipe which was sitting on its nest. His dog was trailing about, and as the shooter stood still he observed the snipe, which he thought to be crippled, start from the ground within a yard or so of his feet. The bird fluttered away a few yards and then lay upon the ground with both wings outspread, apparently quite helpless. Something impelled the shooter to look about him, and there at his feet he saw what he had never seen before, a nest of genuine jack snipe. There were three eggs in the nest; and the finder describes them as being surprising to him in their size. They were nearly as large as pigeon eggs, but very large at one end and tapering rapidly to very small size at the other. In color they were blotchy yellow. It is needless to say that the shooter did not attempt to injure the mother snipe, which finally flew away in regular jack snipe fashion, and not in the least crippled. This gentleman says that he never had before seen a jack snipe resort to this well-known ruse, which is practiced by mother birds of many species. The same friend tells me that in earlier years, when he did not put up his gun at the first of May, he has found jack snipe in this latitude as early as May 10, showing well-developed eggs. The birds were very fat and offered easy shooting, but since then he has made a game law of his own, which he has never violated.

This discovery of the nest of the jack snipe is the second of which I have ever heard, although it is well known that these birds nest to a certain extent, even in these days, over a great portion of Illinois and Indiana. Earlier in the history of shooting of this region, when ducks occupied more attention than snipe in the minds of the sportsmen, the jack snipe bred in the marshes of the middle West much more than they do now. They unquestionably breed to a great extent in

the marshes of central Wisconsin, and much of the September snipe shooting on the Winneconne and Horicon marshes is on local birds. The bulk of the flight, however, passes on into the mysterious North, where the main nesting grounds are supposed to be situated. Even there, I imagine, this wise and secretive little fowl hides its nest so skillfully that it is rarely seen by the eye of man. It is no wonder that tradition assigns odd habits to certain birds of little known antecedents, such as the snipe, the woodcock and the rail. Is it perchance true that this snipe discovered by my friend upon the Kankakee marsh was a freak of its kind, and that for the most part the jack snipe come up from under the mud in the spring after their hibernation, as it is well known among many natives is the custom of the little rail bird?

After the snipe we have nothing until the woodcock, that other weird, mysterious creature, shall appear in its own occult manner along the tangled streams. This bird is the subject of much story in the Eastern States, but as I have earlier remarked, it does not cut much ice in this neck of the woods, possibly because it is most abundant in July, when good men sleep, and in light-winged dreams ascend to other places than waist-deep bogs where mosquitoes and malaria are more certain than the bird with the bulging brow. If one could hunt woodcock as my friend does doves down in Tennessee, with a bucket and sangaree and a fan, it might be practicable, but the hard common sense of the Chicago man usually keeps him out of the slums most affected by this paradoxical beast. I say paradoxical, because no man hath yet discovered how it is that a woodcock can poke around in the uncleanness of his surroundings and come forth therefrom not only unsullied, but exceeding sweet. Thus goes on the divine poem of nature, by which spring broilers are extracted from earthworms and the grasshopper of the field.

With the woodcock comes the black bass and the smiling muscallonge. Thus we need wait but a few short weeks between courses of our sporting repast; and the toothsome and gamy clay bird we have always with us.

Audubon Society of Indiana.

There are few names in American history better known than that of Audubon, yet perhaps a great many do not know so very much about his personal life. A newspaper of Indiana states that he was born "across the river from Evansville, Ind." The State of Indiana this week formed an Audubon Society, under the auspices of the Indiana Academy of Science, and it is the intention that the name of the great bird lover, who knew so intimately all the wild creatures of this country, shall not be allowed to die in that State. The inauguration of this movement appears to have been of exceptional interest and strength, and among other papers read at the initial meeting the following were scheduled: Gov. J. A. Mount, on "The Importance of Protecting the Birds;" Amos W. Butler, on "Bird Life in Indiana;" D. M. Geeting, on "What Can the Public Schools Do for Bird Protection?" W. S. Blatchley, on "Birds in Winter;" James Troop, on "Birds and Insects;" Joseph Swain, on "Audubon;" Mrs. Martha McKay, on "The Relation of the Birds to Man;" George L. Roberts, on "Bird Study in the Schools;" C. E. Newlin, "Birds' Nests;" "The Boy and the Pigeons," by George S. Cottman; "The Effect of Man's Destruction of the Birds upon Himself," Mrs. May Wright Sewall; "Preservation of Natural Forest Areas and their Influence on Birds," by William Watson Woollen.

The Passing of Kaskaskia.

With approaching senility we are all given to reminiscing. Not content with the history which is going on about us, we want to go back and dig around in the history which happened about the time we happened, or maybe a little earlier. Thus I have for many years been much interested in the early history of Illinois, about the time of the early fathers. Any one who lived in those times, in the past century or the early part of this century, must have heard of the town of Kaskaskia, Ills. This town was one of the very earliest human ganglia of sufficient size to be called a settlement. Its early inhabitants were mostly French, and many French families have remained in that part of the State until this day. I do not remember at just what date the town of Kaskaskia was founded, but it was before Eddie Price came to Illinois, which is a very long time ago, for Mr. Price has often told me that he was here before they had turned the water into the Kankakee River. In the early days, when St. Louis was a fur trading post, they used to talk about the "French settlements" up in Illinois, meaning by this Kaskaskia and vicinity. But as I was about to say, the ancient town of Kaskaskia is now approaching its end. A good many of its inhabitants have left to go to Oklahoma and the Paris Exposition. The vineyards round about have become less and less fruitful. The river has been washing into the streets, so that the scow of the cat-fisherman may now pass softly where once the moccasined feet of the voyageur trod. This week the Great Father at Washington reached out his hand and took away the post-office from Kaskaskia, inasmuch as most of the inhabitants sleeping on the hillsides of that quiet country are now of that sort who care not for the printed page, or the indited messages of love or commerce. Kaskaskia has passed away, and with it what a fund of story. What stirring times there must have been in those days of real men and real opportunities! To-day we fight each other all over this country for \$9 a month, and feel savage if we see another fellow smile. Would it were Kaskaskia back again, and that there were left alive on earth only the men and women who read FOREST AND STREAM and love its doctrines! It would again be a lovely world if Kaskaskia were here.

Too Bad.

A current number of a newspaper of Williamsburg, Iowa, has the following lament in regard to the oppressive game laws enacted by the Iowa Legislature:

"Iowa's new game laws have practically killed the sport of hunting. Dealers in sporting goods report a great falling off in their sales. No man cares to go out for a day's sport and take chances on paying a heavy fine or serving a jail sentence by un-

consciously violating some game law he is unaware of."

Inasmuch as there is no kind of game on which the gunner can legitimately exercise his skill until after the breeding season, it does indeed seem too bad for the downtrodden and oppressed American citizen. Let me call the attention of our suffering fellow men across the line to the late story of the sitting hen in *FOREST AND STREAM*. There are many setting hens in Iowa, and I know of no law protecting them. I trust all readers of the newspaper referred to will rejoice exceedingly and go forth after the hen.

Spring Venison.

A while ago State Warden Brewster, of Grand Rapids, Mich., brought a case against W. O. Holden, landlord of the Park Place Hotel, of Traverse City, Mich., charging him with serving venison in close season after the five days limit. During the past week the case came up before Judge Corbett in the Circuit Court at Traverse City. The result is not encouraging in the precedent established. Holden admitted serving the venison, but claimed he bought it in open season. Judge Corbett said in his decision that under the Michigan law a person may keep for his own and his family's use all the venison on hand at the close of the season. "The law thus does not define that if one keeps boarders he shall not serve such venison to them as well as to his own family." By this ingenious piece of judicial wisdom Judge Corbett, having given into the hands of any landlord paternal care over all the earth that has the price, infers that Mr. Holden was not culpable in serving this venison to his "family." Napoleon Bonaparte is said to have been very fond of large families, for military reasons, but it would appear that he must yield the palm to Judge Corbett, of Michigan, who has given us the last word in regard to the size of a legitimate "family."

Invitation to the Klondike.

I have been invited to a good many good corners of this big country in my time, but not until now to the big game country of Alaska, where above all places I should be delighted to go. Mr. A. G. Jordan, who is now temporarily stopping at Springfield, Mass., is just back from the Klondike region, and is now getting up a party which he is to pilot to the gold fields. I never have met Mr. Jordan, but to show how small this world is will explain that he was met on a railroad train by a friend of mine, Mr. Bruning, who was also a stranger to him, but who seems to have introduced himself and myself too. Mr. Jordan has been up in the Stewart River region, he writes, and he goes on to say:

"I have been in the Northern region about seventeen years, and know most of the haunts of the game up there. I would have liked to see you, but have to get on East to Springfield. After locating my party all right up in the Klondike I intend to devote my time to big game hunting, collecting curios, heads and horns. There is any amount of moose, caribou, goat, sheep, black, grizzly and silver-tip bear. Now, if you can get away this summer, I would be pleased to meet you, say at Wrangel, Alaska. I will show you what I call sport, and you will have all the satisfaction a hunter can feel."

This is simple, plain and easy—all but the getting away. This new far land is very tempting, and it is without doubt the latest thing in big game grounds. Many will have the good fortune to explore a part of it, and all such are to be congratulated. I must thank my unknown friend, Mr. Jordan, very much for his invitation, although it makes me very miserable. There isn't a whole lot of fun living in a place where the only game is English sparrows, and where grass is 10 cents a bag.

A Bobo Bear Preserve.

I frequently hear, even at this late day, of the *FOREST AND STREAM* story describing the hunts with that king of all bear hunters, Capt. R. E. Bobo, of Mississippi. As I stated later, the result of the *FOREST AND STREAM* story was not altogether a pleasant one, especially to Capt. Bobo himself. The reports of the wonderful abundance of this large game in a country so little known, but so near at hand, brought the region into a prominence which in the minds of the local hunters was an entirely undesirable one. Since then the timber buyer, land buyer and speculator have pushed more and more into that rich and favored country, the Delta of the Mississippi, and Capt. Bobo now sees destruction threatening his ancient hunting grounds. The grounds themselves were and are to-day wonderful ones, and I presume it is easily true that there does not exist in America any area of four times the extent which can show an equal amount of bears, deer and turkeys. Here Capt. Bobo has lived for years, enjoying sport such as I presume no other man in America has enjoyed in this generation. The number of bears that he has killed in his lifetime would, I think, not only pass the hundreds, but actually go into the thousands, and this I say seriously. He writes me mournfully now that "he only killed thirty-five bears this past winter." This he calls poor sport.

But what I wanted to get at is this: Capt. Bobo has seen the best of the open hunting days in his generation. He has now joined the procession, and realizes that the time for the open hunting in his country is nearly over. What it must mean to him to admit this any one can best understand who knows the man. I confess to a great personal sadness when I see Bobo, the bear hunter, come out and say that he needs a preserve for his bears. Yet this is what he says.

In a letter received by me this week Capt. Bobo goes on to say: "I have a plan in which I wish you would help me out. It has always been my wish to keep the public out of this country, but as you know, that day has passed. The settlers are coming in droves to this rich soil, and it is no longer a hidden wilderness. The axman is on his way to the best hunting grounds of the world. The only thing which can save this great hunting place is for a few rich men to put in what they call spending money, and create a home for this game. If we could keep out the lumberman and the homesteader, we could protect this game country, and it would always offer a place for magnificent sport both in hunting and fishing. But something must be done and done quickly, or hunting here is a thing of the past. I have only killed thirty-five bears this winter. I have

a ranch now on Devil's Lake, near where you killed your bear by firelight. I am sorry to see the game decreasing and being scared away. Take up this idea for me and set the ball rolling. I would like to tell some men who want a genuine game preserve something about this country here."

I presume I am approached on an average a dozen times a year by some one who wants help in establishing a game preserve, such preserve to be arranged to his own personal profit. The idea of personal profit is not the one inspiring Capt. Bobo in this movement, which I am sure he makes only with reluctance. I always answer inquiries of the above nature to the effect that I am a newspaper man and not a real estate man, and that *FOREST AND STREAM* is a sportsmen's journal and nothing else. In this case I can only say that it would please me as much as Capt. Bobo to see his country protected, at least to a point equal to the damage caused in it by the well-meant exploiting of the country in *FOREST AND STREAM*. If he can enlist the aid of some wealthy men, it will be matter of good fortune for the best interests of all sportsmen. There never was such a game country in America as this Delta country, even within the present decade. Bear hunting in that country, such as might be possible on a preserve of large acreage, would be bear hunting of a sort not known by very many men, rich or poor, nor by very many kings and princes, and under the regulations of a good preserve the sport would be as certain as the less exciting sport of deer shooting in Europe. Animal and vegetable life of all kinds is wonderfully prolific in this rich, mild country of the Delta. It seems a wide thought to imagine it, but perhaps we may yet see a Bobo bear preserve in the history of American sport. If so, I will warrant in advance that it will be the most wonderful game preserve in America, so far as actual hunting of actual big game is concerned. The wild boar, if introduced in the Delta, would increase wonderfully. Wild boar and wild bear—the thought has something of fascination; a fascination never to fade from the mind of any man who ever heard the bear pack open in the woods and brakes of the Delta.

CHICAGO, May 3.—[Special to *FOREST AND STREAM*.]—The Maksawba Club's house on the Kankakee was totally destroyed by fire on Sunday, and many guns and much clothing were lost. The club will rebuild.

Got Some.

Mayor Harrison, of Chicago, took a little jaunt after jack snipe early this week among the Indiana marshes. He alleges that he slew eighteen jacks and a wad of sand snipe. While I do not wish to be engaged in any entanglements of a controversial or sporting nature, I would like to wager the price of a new hat that the Mayor of Chicago can skin the Mayor of New York, or any other city, in a mixed race on snipe, quail and trout. There may be others like our Mayor, but I don't think they can be found.

E. HOUGH.

1206 BOYCE BUILDING, Chicago.

Muskrat a Delicacy.

I AM not a regular reader of the *FOREST AND STREAM* for two reasons: (1) I haven't the time, and (2) the yarns make me feel like a pup tied in the yard when the folks are on the front porch. After reading them I feel like growling at the job that holds me and taking a bite out of the jobber. In my days of rags and poverty I saw a great deal of hillside, meadow, spring, wild marsh, creek, river and bay, and my present affluence is not sufficient to allow me to leave my domicile among millions of people for "some vast wilderness where the wild man roams at his leisure and the wild beast howls for his prey."

I have read about delicious venison steaks, but have said I did not like them because they were to me tasteless and dry; and thus opened the batteries of a deer-hunting enthusiast, who would have sworn by car-horse if he tackled it after a stomach-starving, heart-invigorating tramp through the woods. Let the dry venison fellows croak "Chump" in chorus, but give me muskrat. I will confess, however, that I have never eaten venison in the woods or cooked by any one except those who had only cooked it occasionally; consequently I am open to conviction.

I have lived in a muskrat country and traded in their skins by the thousand; but it was not till I had left that I first met the animal with a knife and fork. My wife came from the other side of the same bay that I had been familiar with, and on her side muskrat was a drawing card at church suppers; and she knows how to prepare it fricasseed or in imitation of terrapin. Last winter some of her friends sent us three; and I invited a young chap who is my neighbor to join us in our muskrat banquet. When it was served I helped him liberally; and as we were both strangers to the toothsome dish his face wore a somewhat troubled expression at the generous portion I dealt him. My wife, having prepared it, received a similar supply with a confidence that was assuring; and I helped myself. Sitting opposite my guest, it seems superfluous to say that I saw him and he saw me; but really we did, and there seemed to be an inquiry in the gaze that was mutual. After the first forkful there was a facial relaxation that dispelled constraint and brought a genial interest which was more like delight than satisfaction. I helped him again more liberally, and myself without stint; and we gave what my wife termed a gastronomic exhibition, which we proclaimed was due to the excellence of her cooking.

It is not necessary for me to say that the muskrat is a clean little fellow, and those who have met him outside of trap or snare know that he is game. On the table he is also game, and game worthy of an epicure, with a flavor somewhat like the wild ducks that have been shot in the marshes where he has fed.

He should be skinned carefully so that the musk bags will not be opened, and he should be opened and cleaned. In cold weather it is no disadvantage if he is left out and frozen. He should then be soaked in cold water over night. Then the body should be cut in suitable pieces for serving when it is ready for the pot, in which a few slices of salt pork should be added. Put

in water enough not quite to cover the meat; and stew slowly until about dry, the pork keeping it moist and from burning. Pepper and salt about the same as chicken while it is cooking, which will not be over one and a half hours. Bread and butter and jelly are all the trimmings required to make a veritable banquet at home or in the swamp.

This new experience adds another to my troubles. I am unable to buy muskrats at the markets, and live too far away from their natural haunts to get them myself; but I hope that I shall be able to arrange for frequent meetings with the game, and I hope that many who read this may seek his acquaintance and be delighted.

MUSKRAT.

National Park News.

MAMMOTH HOT SPRINGS, Yellowstone National Park, April 21.—*Editor Forest and Stream*: The past winter has been a very mild one in this section of the country. All the game has been doing well. I think there has been no loss from starvation, although thousands of elk have wintered in sections of the Park where the range is limited.

Scout Morrison tells me he has snowshoed a little over 1,200 miles the past season. He saw twenty-one buffalo in one band, four in Hayden Valley. I think these are the four I saw the winter before. There are a few buffalo on Falls River, and three were seen on the old buffalo trail near the Fountain Geyser. Eight more were seen in one band on the east side of the Yellowstone Lake, and several more in other parts of the Park.

As the winter was so mild, the Yellowstone River was closed by ice only for a few days. It is a great wintering place for ducks, geese and water fowl. Morrison said he saw fifty swans at one time on the river just below the lake. I have seen hundreds of geese and ducks, but never more than about twenty swans.

I found the roads from Gardiner to the Mammoth Hot Springs dry and dusty. I saw no game in the Gardiner Cañon, but on the flat across the river saw

A YELLOWSTONE PARK BEAR.

Photo by Mrs. H. E. Klammer, July, 1897.

a few antelope. As the snow is well off Mt. Everts except for drifts, the antelope are moving back, on to Black Tail Deer Creek. Even the elk are moving from their winter range to a higher country, Specimen Ridge and the high plateaus.

I was very much pleased on my return here not to see one coyote. Neither have I heard one. They have been very successful in killing them off. The people at Gardiner have killed quite a number with poison and guns, just outside the Park, while along the boundary soldiers and men appointed have so thinned them out that they are quite rare.

To show how little snow there is in the country, I can say that a team went through Golden Gate and on to Swan Lake flat on March 21. There they could drive around by keeping out of the drifts. Of course the drift at the Gate had to be shoveled out.

There is so little snow throughout the mountains, it looks as if we were not to have very high water this spring. I saw a man from Jackson's Hole who says there is very little snow there, and that the game is looking well.

There are about twenty-one sheep on the upper Gardiner River, where the east fork comes in. They had been down as far as the mouth of Gardiner River.

Several large bands of blacktail—I ought to say mule deer—were around the springs all winter. I am told of their getting into dooryards and doing other queer things, like looking into windows at flowers in pots, as though they would eat them if the window was open; but I can't tell such stories unless I have a photograph to go with them.

I inclose a photograph of one of the Fountain Hotel bears, taken by Mrs. H. E. Klammer last July. She was within about 20 ft. of it. I think this must be the bear the cat drove up the tree; it is rather familiar, and looks as though it wanted to investigate the kodak.

Some of the troops have been sent from here to care for Fort Missoula, and all the soldiers seem to want to take a hand in the coming trouble. If they are removed Congress ought to provide for a number of scouts or Park police.

E. HOFFER.

Game in the Sawtooth Mountains.

OVANDO, Mont.—The Sawtooth Mountains belong to the main range, connecting at the head of the Lemhi River about 100 miles south of Gibbon's Pass. I have been a guide in this country for twenty years and know every part of it. The Sawtooth Mountains beat the world for deer and goats, with bears and elk in goodly numbers.

M. P. D.

Jackson's Hole and the Park.

JACKSON, Wyo., April 8.—*Editor Forest and Stream:* The pending bill, introduced by Senator Hansborough, extending Park control over the Teton Timber Reserve, seems to have caused much misapprehension and idle comment, generally amusing, often exasperating.

The primary object of the measure is the acquisition of a winter range for the big game of the Park. There are "side issues," but everything else is subservient to the central idea of game preservation. This idea is timely, well founded, and deserving of encouragement. No sane, disinterested person will demur to any measure calculated to benefit the national pleasure ground without working a hardship upon the contiguous States.

But why should the Eastern sportsmen seek to harass the settlers of this valley whenever the question of Park extension is mooted?

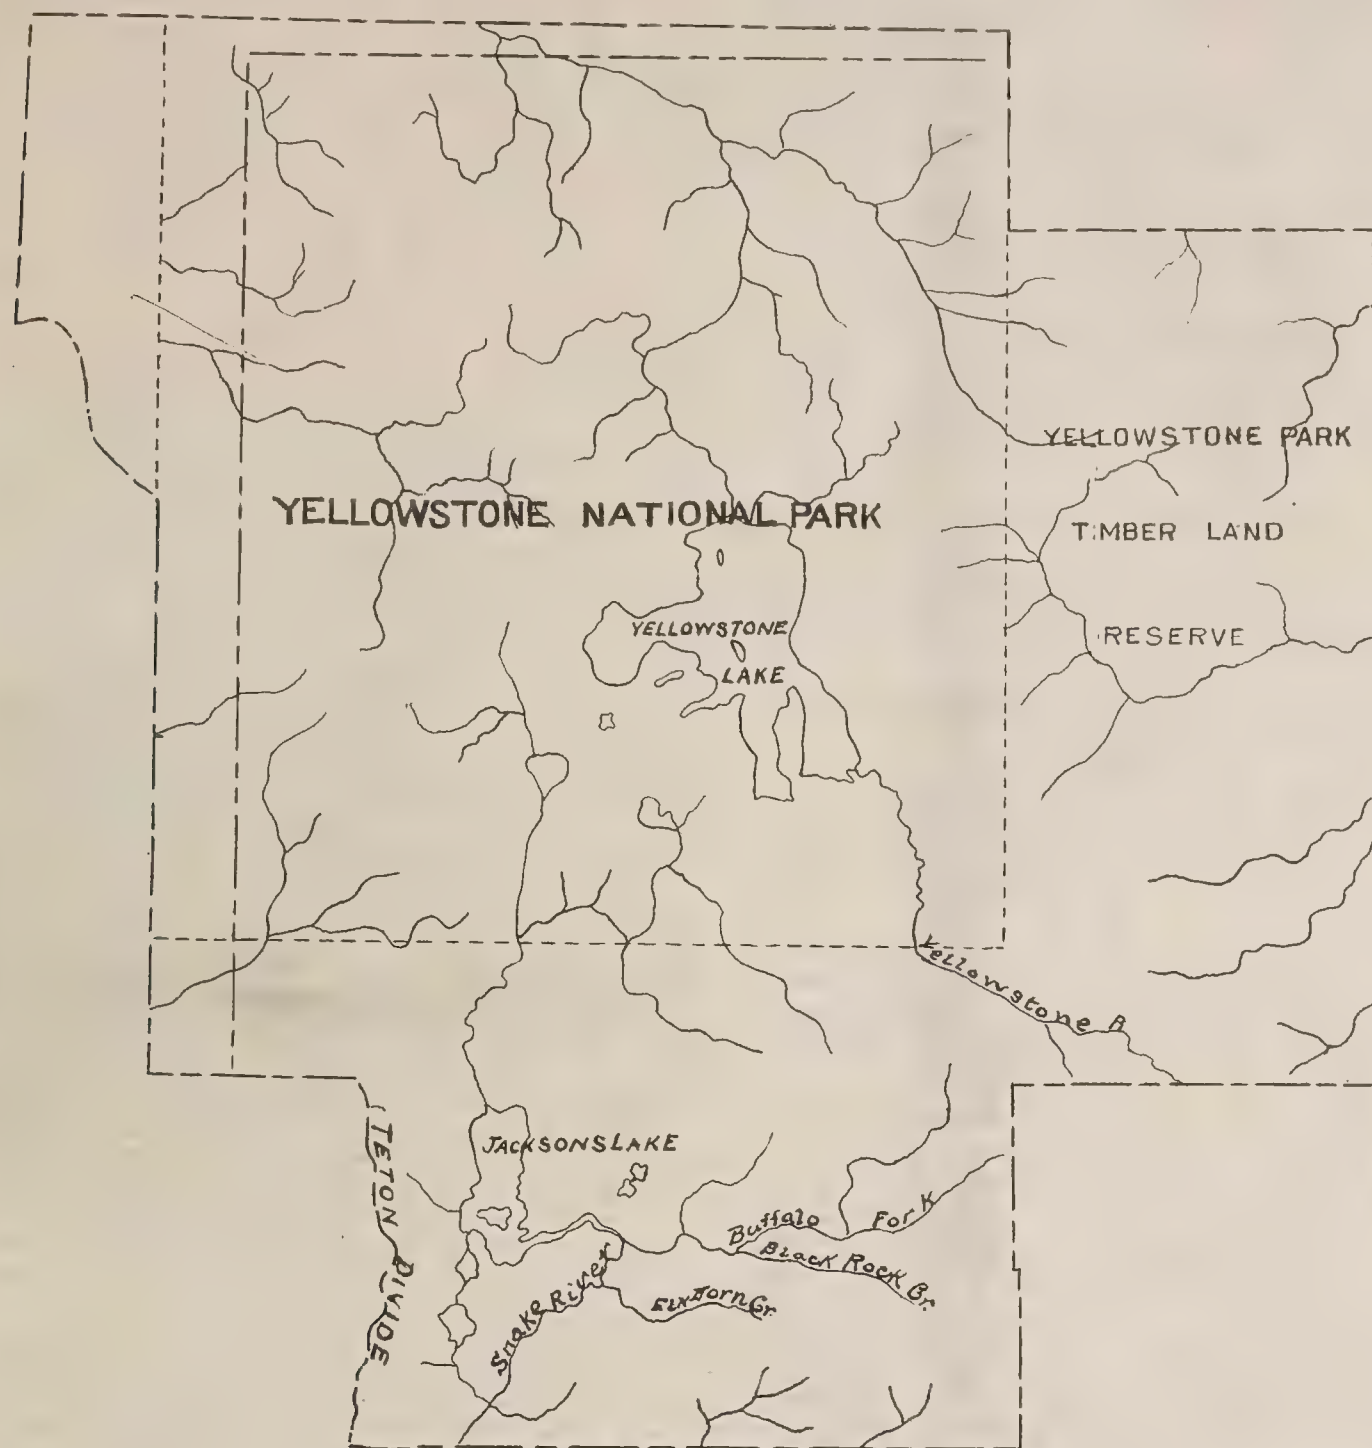

Various articles have appeared, in various journals, tending to calumniate our people. For instance, the point is frequently made that an extension of the National Park south would result in driving out many

tion upon the Federal courts, and ultimately resulted in the far-reaching decision of the U. S. Supreme Court affirming the contention of the Wyoming State authorities that Indians were amenable to the State game laws as well as whites.

At a recent mass meeting, called at the suggestion of our Congressman, a resolution was adopted favoring the addition of the Teton Timber Reserve to the National Park. Does this action savor of "lawless poachers" who dread the proximity of legal restraint? We live here among the big game, and we want it protected—for selfish if for no higher reasons—and we know more about the exigency of the situation than the whole army of squirrel hunters, who have yet to cross the Mississippi.

Extend the Park, certainly. We want this matter settled soon and permanently; but no one who is familiar with existing conditions expects the proposed extension to include the Jackson's Hole community.

There should be ample room in the National Park for breeding ground and winter range for the elk and deer, whose natural habitat it is; but it is not necessary to take half the State of Wyoming for this purpose.

PRESENT AND PROPOSED PARK BOUNDARIES.

desperate and dangerous poachers—men who live by depredating on the Park. And Jackson's Hole is the "bete noir" of many advocates of a southern addition to the Park; they invariably refer to the matter as "taking in the Jackson's Hole country," thus ousting a set of savage centaurs, not only for the betterment of the game, but for the protection of sportsmen as well.

Now all this is not only nonsensical, but it indicates, on the part of the writers, ignorance or malice, or both. Perhaps a truthful synopsis of the situation may cause a better understanding all around.

The name Jackson's Hole is an indefinite designation. Locally it means the settled portion of Snake River Valley east of the Teton Pass and southeast of Teton Peak; popularly it means all of the country lying along Snake River from the south line of the National Park to the mouth of Hoback's River. The Jackson's Hole settlement proper, surrounding the Jackson post-office, embraces nearly six townships, has a voting population of about 150, a tri-weekly mail service, and a class of citizens who need not fear comparison with an equal number in any neighborhood in the Union.

Instead of being temporarily held by a migratory band of poachers this country is permanently settled by a peaceable, prosperous and intelligent people. The ranchmen here are engaged in cattle raising, and some meadows yield as much as 250 tons of hay per season.

True, many of our people act as guides, and furnish outfits for tourists and hunters each season; but they do not poach. No one but a simpleton would sneak into the Park to hunt, and run the risk of detection and punishment, when a far better game country can be found nearer home. Nor should the people of Jackson's Hole be judged by tourists who have been no further south than Jackson's Lake, and have there come in contact with a few itinerant rumsellers. Here we have a regularly organized school district, a good school-house, and a commodious and comfortable club house.

And have we, who live in the heart of the game country, done nothing for game protection?

The people of Jackson's Hole took the initiative in stopping the wanton slaughter of big game by the Indians; it was this local action which forced the ques-

Enough is a good thing, and can be obtained, but an effort to get too much will result in disaster to the whole plan.

It is the impression of a good many people of ordinary intelligence that a sportsman occasionally wants sport, and that legitimate sport is harmless and healthful. Shooting big game, subject to sensible legal restrictions, is by many considered the very acme of field sport. In order to shoot big game there must be some place where hunters can go with a certainty of finding such game. It would seem unjust and impolitic to corral all the big game in the National Park. Let the Park embrace all the unoccupied territory requisite for the maintenance of a large and varied assortment of native game animals; but leave us a few hills and dales where the true sportsman can enjoy his brief outing, unvexed by the arbitrary restrictions of the national preserve.

D. C. NOWLIN.

Eskimo Curlew at Currituck.

KNOTT'S ISLAND, N. C., April 28.—There has been the largest flight of Eskimo curlew to-day I have seen in thirty years. There were thousands upon thousands of them. I do not know how to account for it unless they have been blown in by the northeast storm, which has been blowing about fifty miles an hour for the last thirty-six hours. I know they are often seen on the Pacific coast on their way from China and Japan to Alaska and other northern points; but they were never seen in such quantities here for many, many years past. I placed my decoys exactly in the line of flight, and expected fine sport, but they would not decoy at all. I only succeeded in bagging three. They were very large, but exceeding thin, proving, I think, that they had been flying a great distance.

English snipe have not been abundant here this spring, forty-five being the largest bag I know of by one gun. But yellowlegs, especially the large size (winter yellowlegs), are very plentiful just now. I shot fifty-one one afternoon this week. The small-sized yellowlegs and dowitchers are usually here in quantities all through May. It is too cold for them yet; the thermometer is down to almost freezing to-day.

MORE ANON.

Dr. Massamore.

THE Baltimore Sun gives these notes of Dr. Geo. W. Massamore's life:

Dr. Geo. W. Massamore was born in Manchester, Carroll county, Md., but had lived nearly all his life in Baltimore. About the time he completed his studies the civil war broke out, and his sympathies being with the South, he enlisted in the Confederate army and fought throughout the war under Gen. Ewell. Upon several occasions Dr. Massamore distinguished himself for gallantry upon the field. He was in the battle at Gettysburg.

At the close of the war Dr. Massamore returned to Baltimore and entered the Baltimore College of Dental Surgery, where he graduated in 1867. He practiced here for a number of years until forced to give the work up because of ill-health. He was one of the best known numismatists in the country, and owned a costly collection of coins and medals. In 1881 he was elected a member of the Numismatic and Archaeological Society of New York and continued a member until his death. He was also an enthusiastic stamp and autograph collector. His autograph collection contained the signatures of Washington, Jefferson, Jackson and other men famous in American history.

Dr. Massamore was perhaps best known throughout the State as an enthusiastic sportsman. He was zealous in having the game laws of Maryland improved. He was secretary of the Maryland Game and Fish Protective Association, and also a member of a similar association in the District of Columbia. Recently he was appointed assistant State game warden.

About a year ago Dr. Massamore had seines hauled in the Chesapeake and Ohio Canal, saving in this manner thousands of bass, which he put back in the Potomac River. It was through his efforts that the bill for a close season and restricting the methods of fishing in the Potomac became a law. He spent much time at Annapolis during the January and February sessions of the recent Legislature looking after the bill making game laws uniform in every county in Maryland. While engaged in this work it was that he caught the cold that finally resulted in his death.

John Gomez has a New House.

THE Fort Myers, Fla., Press has this story of a recent Panther Key real estate transaction: Down on Panther Key, on the southern end of Lee County, among the Ten Thousand Islands, is the home of John Gomez and his wife, Mr. Gomez being probably the oldest living man in the United States. A few days ago we learned of a new incident in the life of the old man, from Mr. J. W. Watson, who lives about eighteen miles from the veteran.

Some time ago another old citizen on the Keys named Brown made a bargain with John Gomez to build a new five-room cottage for him on condition that Gomez was to deed him his island when he died. John Gomez is now 117 years old, and Brown was about 65 years old. Brown naturally expected that he would soon come into possession of the island through the death of the old man, but he reckoned without his host, for Brown has crossed over the river to that unknown land from whence none ever return, while old John Gomez is in possession of the new five-room cottage, in good health, and apparently good for a dozen years more of this life.

John Gomez was born in Portugal in 1781, and when a young child moved to Bordeaux, France. At the age of twelve he came to the United States, and for the past twenty-two years has lived on Panther Key, an outside island of the Ten Thousand group. He is hale and hearty, apparently able to take care of himself for some time to come. His wife is a pleasant old lady of seventy-five years, and shows more feebleness than does "Old John" himself. He occasionally visits Fort Myers, and has many friends here who are always pleased to see him.

A Camp-Fire on Jersey City Heights.

RECENTLY between twenty-five and thirty ladies and gentlemen gathered at the residence of a well-known sportsman on "The Heights," to renew old associations and recall Adirondack experiences. New York and Brooklyn, as well as New Jersey, were represented by men as expert with rifle and rod as in business, medicine and theology. Patriotic song and excellent piano and harp music prepared the way for camp-fire reminiscences. Then a prize contest in storytelling took place under the following rules:

1. Each story must be of personal experience in the Adirondacks.
2. Each story must be limited to three minutes.
3. Each story must relate strictly to the topic assigned.
4. Each story must tell the truth, the whole truth, and everything but the truth.

Two prizes were awarded: First, for the best story, a paddle; second, for the poorest story, a can of powder (sand). The ladies of the company were the judges.

Among the topics announced were these: Setting fire to water and cooking dinner over it; supper time in camp and rations lost in the woods; with parallel between the sinking of the Maine and the sinking of a little buck in Cascade Pond, both caused by an outside explosion; reflections in a beech tree at midnight; chasing a deer with grappling irons; initiation in Adirondack life, with incidental comparison between the "dogs of war" and dogs of the Adirondacks; how four women took hold of one man, saying "Give us a row," and how the speaker gallantly came to the rescue; meditations on Watch Rock.

Much merriment attended the contests and the awarding of prizes. Who won must remain a mystery as impenetrable as "The Lady or the Tiger?" It is sufficient to say that the programme was so effective that when the dining room was reached everybody had a genuine woods appetite. The favors were cedar tips fresh from Blue Mountain Lake. Later followed by request a stereopticon exhibition of forest views, mainly photographed by gentlemen present. At a late hour the camp-fire went out, but its cheery reflections will long brighten the memories of those who gathered around it.

JUVENAL.

Sea and River Fishing.

Fishing Up and Down the Potomac.

Great Cacapon.

ONE of the wildest, prettiest and most romantic of the many tributaries of the Potomac is the Great Cacapon, sometimes called Capon for short, which empties into the main stream between the Pool of Woodmont and Sir John's Run, nearly fifty miles above Harper's Ferry.

A flag station taking its name from the stream is at its mouth, and here the angler may procure a team and drive up the river road as far as desired.

A considerably longer route, requiring much more time and labor, but which amply repays the extra investment, is to stop at Hancock, a couple of stations nearer, and take the little spur railroad for three or four miles to Berkeley Springs.

This road winds along the valley of the brook, fed by the wonderful warm springs, which break out in a bunch at the foot of the mountain, and sustain the little settlement, that may be some day a very popular resort.

One of its drawbacks heretofore has been a tannery established not far below the springs, for which the warm waters were probably very convenient, but whose discharges of refuse destroyed the beauty of the crystal brook, and a stream of tar would be more sightly and more savory than that which unwinds to the visitor in his ride to the springs. It may be of some slight advantage as rendering treatment universally necessary on arrival, for the conditions were calculated to make a well man ill.

It is said just now not to be in operation; the proprietors own several other plants more advantageously situated for necessary materials and markets, and it is to be hoped they may continue to find the others more profitable and abandon this.

The industry is one of vast importance and value to us; its existence a necessity; but so is cooking—and yet we object to its evidences in the proximity of a parlor or drawing room. So such a plant at a pleasure resort is a blot; its destruction of a beautiful stream a sin; casting its refuse in the river to kill the fish and threaten the health of the population below who drink the waters—a crime. Hopes are reiterated that the proprietors may find such abundant profits elsewhere as to spare this little valley.

The waters of the springs are pleasant enough, and said to be wonderfully effective in the treatment of some ailments, but that is a matter of doctors, fashion, wallets and constitutions.

We embarked in a substantial "fix" with a strong team, and sailed up and over the Warm Springs Mountain, and wound down the other side, a devious way, into the valley between this and the Cacapon Range; then a long climb to the summit of this, and the Valley of the Great Cacapon was at our feet, with a background of distant hills, and the haze of a summer afternoon softening the landscape and veiling the detail of all but nearby objects.

We rapidly descend to the level of the river valley and reach a farmhouse some sixteen miles from the mouth of the stream, and are glad to "light" after our pounding; and how we do enjoy the supper which comes later; then two great easy chairs on the wide porch woo us to an evening's enjoyment of curling blue smoke, and watching the deepening shadows in the valley and the waning high lights about the surrounding green hills; we dream of to-morrow's sport, but an early curfew signal sends us to finish our nap in the company bed.

The next morning we find the boat in which we are to drift down the stream fast at the ford. The team is to take a later start, and driving down the river road, which has a habit of losing itself among fallen timber and washouts, is to keep as near us as convenient, in case of mishap.

We soon find fish, but most of these first are too small to keep. Maybe the residents have caught the larger ones here, or educated them to be more wary of their natural enemy.

At some of the little rapids the rocks are so high and the water so low that the boat requires assistance to get over, and sometimes we need it for the same purpose.

My companion is large, the boat is small; he is not an angler, and his enthusiasm on the subject is all anticipatory; his weight makes such a difference in the draught of the little boat; and the cranky skiff keeps him in an agony of apprehension concerning the stability of his equilibrium; so he prefers the road most of the time to the boat.

Fortunately the stream is narrow enough to require no rowing, only to keep the nose of the skiff pointed down stream, and while this loses lots of good fishing water there's plenty left, and rises enough to satisfy a glutton.

Little fly-fishing is done on this part of the river, and the ambitious angler who makes a trip here has practically virgin water.

The bass are not large, but numerous. There is little vegetation along the banks and few bushes come down to the rocky channel; so there is little shelter but the stones, and it is into their shadows most of the casting is done.

The scenery is very fine throughout its course. The most striking feature in this section of its panorama is a great tower, which "stands four square to all the winds" that blow; at least that is the impression from the distance we view it. It stands out from the face of the mountain, its green top apparently inaccessible, but once gained, an impregnable stronghold. It is called "The Eagle's Nest," and the usual legend is associated with it; this one may be true—that during the early days a hunter and his two daughters occupied a mimic fort which he had built on its summit, and here he could leave them in comparative safety while he inspected his traps or restocked the commissary. One sorry day a band of roving Indians surprised him in the valley, but he succeeded in reaching his tower of refuge,

and from the advantage of his height and superior weapons easily kept them under cover. But while they showed an appreciation of his advantage, and a realization that their charges were expensive, they manifested no disposition to abandon the siege, and soon convinced him they meant to keep him where he belonged till starvation did their work. He was a reconcentrado, and didn't know it. There is a hiatus in the story as to suitable provisions for water on the isolated pinnacle; there is room enough for a cistern; he may have had a pool or barrels; perhaps its lack led him to the romantic and heroic part of the story. Finding the band disposed to become at least a temporary permanency in his Happy Valley, he became anxious, then desperate, and one night when a wild mountain storm had driven the besiegers to shelter, and they had relaxed something of their customary vigilance, he left his girls, stole down his winding stair, up the face of the mountain by a secret path, and made his way in safety to the settlements for help. The story would be incomplete if it did not recount how each day the girls fired a shot or two at the skulking Indians among the trees below, just to convince them that the old man was still on guard; and how the unsuspecting savages were finally surrounded, surprised and slain to a man; and the girls never went back to their eyrie, for each found a mate among the rescuers.

Though their names are forgotten, their pillar, better builded than that of St. Simeon the Syrian, still stands to perpetuate the memory of their lives, their peril and their rescue.

It is far below this where we hail our wagon, and with a good basket of fish drive home in the gloaming. One's lines may sometimes be cast in pleasanter places, but not often.

It is said that the bass are appearing at the present writing in wonderfully increased numbers in this stream, by reason of its waters being free from any contaminations from factory or field, and if this be true it will prove indeed an Angler's Paradise to those fortunate enough to reach it this season with a fly.

The Charms of Fly-Fishing.

Speaking generally, the fly-fisher gains much in enjoyment over the man with a float. Every muscle is brought into play, and in these athletic days this is a strong recommendation. His hours unfold to him the ever shifting beauties of the kaleidoscope.

Each cast brings him new skies, and hills, and flowers, and rocks, and new fish to try for.

It is not the proverbial patience of the lone fisherman which is required here so much as energy.

Compared with the kindred sport, hunting, the still-fisher is like the gunner who has a stand or blind, and waits the patient hours for the game to come. The fly-fisher more resembles the eager mountain climber who stalks his prey.

The blind hunter may be strange to his surroundings, but with ears and eyes open to every sound and movement, fares quite as well as the native. The stalker must know every rock and by-path, every salt-lick and drinking pool; signs of wind and weather, may the very habits of the animal he seeks, to reward his quest.

So the fisher with a float, if he but have a general knowledge of the art, may have as good sport the first day in new waters as his last, or as the resident champion in whom use hath bred a habit of getting more bites than his neighbor. But with the fly-fisher, every trip to any locality increases the coefficient of his efficiency and enjoyment. He learns the haunt of many a fish; knows them by sight and sometimes by name; every mossy bank and sylvan spring; each pleasant shade; every stone and stump becomes to him a friend, to ignore whose evident greeting would be a rudeness.

Five miles of stream are to him what the float is to his colleague.

He knows where the wild flowers are thickest, which side of every reach is best; where the fallen trees block the path; the briar thickets, where the bramble and the blackberry weave their webs for the unwary, and which he gives a wide berth.

He knows too where there is a little pool no bigger than a tub, but so close to big water that one flirt of the tail carries to safety its occupant—a finny Daniel Lambert, whose hunting lodge it is, and probably as dear to him as is the camp in the woods to the man who seeks him.

Our failures are our school, and as we frighten out the fish from stone or crevice, each carries with him, securely fastened to his caudal fin, an imaginary aluminum tag, with which we ornament him, confident that next time we will claim our own.

But the account is not all so one-sided, or all who could would soon be fishing with the fly. It is not all gain. What is secured of advantage to observation is lost to contemplation.

To watch the sun and wind, and shadows and current, and depth; the stones and blossoms beneath your feet; the logs in front, the branches overhead, the trees behind—all more ready to take your fly than the fish—are all so many checks to dreaming.

Walton was not much of a fly-fisherman, though I believe with Marston that he knew all that was going at that time on the subject; but he principally watched a bob, and had plenty of occasion between bites to dream or talk, both of which he did to such good purpose. If he had fished only with the fly we should not have had such a book, and he would not have said the sport was a contemplative recreation, but rather an observant exercise.

To this extent the exchange is a real loss.

Wisdom's self

Oft seeks to sweet, retired solitude,
Where, with her best nurse Contemplation,
She plumes her feathers and lets grow her wings,
That in the various bustle of resort
Were all too ruffled and sometimes impaired.

So said Milton. Yet, take it all in all, fly-fishing has many more charms for the business man of sedentary habits. To him his outing becomes a feast. The very attention demanded—to his surroundings and his sport—is proof against the insidious entrance of carking care, of busi-

ness worries, which the contemplative float rather invites.

There is but one rule, however, by which a man will determine which to elect—that which pleases him best.

Not all waters, nor all weathers, nor all tackle, nor all fish, nor all men, are fit for this style of angling; but when the combination is complete it is the royal flush of sport.

The gentle craft is sanctified by the daintier methods of the willowy withe, the silken thread and feather, while geology, botany and entomology attend the angler close to minister to his delight.

HENRY TALBOTT.

Dry Fly-Fishing.

BY GEORGE A. B. DEWAR (AUTHOR OF "THE BOOK OF THE DRY FLY").

In Three Parts—Part III.

The Charms of the Method.

ENGLISH anglers have in the case of many streams been driven to the use of the dry fly through sheer necessity, the wet fly method being no longer of much avail on clear and slow flowing waters where the trout are often assailed and have grown very cunning. Some day, perhaps, American anglers may be driven to the use of the dry fly by similar causes. But though we were compelled to take to the dry fly because we could not do anything on Test, Itchen and other waters with the wet fly, we have soon come to regard the necessity as a very agreeable one. The dry fly is indeed an engrossing and almost enthralling pursuit. The number of its votaries increases every year.

Eagerly scanning the likely-looking spots in the stream for the ring which tells of a feeding trout; stalking that fish with great care and patience; seeing him rise and draw in your neat little artificial; or seeing him rise, follow the lure down stream for a foot or so, and then after evident hesitation decline to have it—these are some of the incidents which make the sport so fascinating. Then the gut casts for dry fly-fishing, out of at any rate May fly time, must be of the finest, and the hooks on which the beautiful duns and spinners are dressed about the smallest procurable; and when a 3 or 4lb. trout in condition is hooked and has to be played with tackle of this description, then interest and excitement reach a high pitch indeed. The rush of a clean run salmon is superb, but personally I know of no sensation in the world of sport to equal that experienced when the twitch of the wrist is given that drives home the hook in the mouth of the 3lb. trout in perfect condition. It is one that never seems to lose its edge, and instead of diminishing in intensity as we grow older, I really think that it actually increases. Then too the first good trout of the season, hooked in one of these limpid streams—what a fish that is to the dry fly angler!

Where fish are not too plentiful—and trout I hold can be much too plentiful—and where they are very hard to "get up" even with the driest of olive duns attached to the finest of fine gut, every trout taken by the angler will very probably have a little history of its own. The angler on such a water has been out perhaps from 10 in the morning to twilight on a glorious June day, and has made a basket of say two or two and a half brace—a very good day indeed, mind you—on some of our loveliest South Country trout streams. On his way home he goes over in his mind the events of the day, and is proudly conscious that his five fat trout, all well above the limit of three-quarters of a pound or a pound, were taken by real skill and patience.

One took an hour and a half to hook. It was feeding on natural fly right underneath an overhanging and very awkward bough. It seemed almost impossible to get the fly over this fish, and again and again in the attempt the angler got hung up in the aggravating willow, or in one of the herbs or long grasses which drooped over the bank close by where the fish was steadily rising and taking every dun sailing down within a foot or so of his lair. Once or twice the angler had to lie flat down and drag himself along the ground in order to stretch out his hand and disentangle the hook without scaring and setting down the fish. Another trout was rising all but out of range right under the opposite bank, and only after many failures, and perhaps one or two cracked-off flies, did the angler succeed in getting well and neatly over the fish. The third, the fish of the day—a 3-pounder in noble condition—rushed instantly into a most dangerous place, infamous among dry fly anglers by reason of its weeds, or stakes, or roots of old, gnarled trees; and this trout was only secured through the angler's knowledge of the spot and great caution in playing him. And so with the other fish; the capture of each is a little history in itself, which the angler may recall days and even months afterward, when he has a little time and the inclination to ponder over fishing days and ways.

Dry fly-fishing has, of course, its drawbacks, its keen disappointments. An ideal-looking day will quite possibly produce no natural fly at all, and with no natural fly on the water there will be no rising trout, and with no rising trout there will be nothing for the dry fly-fisherman to cast to. It is indeed hard to find one's carefully selected day for a celebrated water turn out a fly-less and therefore a trout-less one. The angler whose time is all his own, and whose opportunities are as thick as May flies on the River Test, need not be greatly pitied, but it is different with the busy city man, who has been looking forward for weeks to his day on some famous water near town, and who has most probably promised a brace of trout to every one in his office and to two or three of his neighbors. Such things are known to have occurred even in regard to experienced anglers. Yet they are not quite peculiar to dry fly-fishing.

Despite these and other drawbacks, and with trout growing apparently more and more difficult in the case of many streams to induce to look at the artificial, dry fly-fishing when once cultivated by the keen and thorough angler is sure to remain a favorite pastime. "Neither the art of fly-fishing," said Froude, the historian, "nor the enjoyment of it when once acquired and tasted, will leave us except with life." Certainly the art and the glamour of the dry fly method, when once

known, do take hold of men in a masterful way. Set me down with my rod and box of flies on a fair day, by the side of a crystal, clear, slow-flowing stream containing big and wary trout, and I know well that I shall find that day all too short, even though not a solitary trout be landed. On a May or June day by the sweet water, which winds through the meadows and commons of an English South Country shire, I think too that I shall always be able to see the world as it appeared in the wild woodland rambles of childhood, when

"The earth and every common sight
To me did seem
Apparell'd in celestial light,
The glory and the freshness of a dream."

ANGLING NOTES.

"On a Sunshine Holiday."

THIS is the title of a new book by The Amateur Angler, otherwise Mr. Edward Marston, father of the editor of the English Fishing Gazette, and the volume is just as dainty and just as charming as those which have preceded it from the same pen, namely: "Days in Dove Dale," "Days in Clover," etc., etc.

Mr. Marston's style is singularly captivating, for he has a way of taking his readers into his confidence, as it were, and talking to them instead of writing at them or for them. As he strolls along on his holiday outing, he has sharp eyes, and is a close observer of all things in nature, and when he tells you of what he observes the reader feels that the outing is taken for his especial benefit, and he experiences a keen pleasure that he has been invited to become the companion of the author on his walks afield. He says of his little book: "The chapters are not all about fishing, for I had but few fishing excursions to record; the chief connection between them is that all have reference, more or less, to sunshine holidays."

That the author is a philosopher and does not believe that all of fishing is to catch fish is evidenced by his chapter on "The Prose of Fly-Fishing," from which the following is extracted: "When the wind fell, a little another torrent came on, and we were driven to seek shelter under our favorite wide-spreading ash, which the Professor long since christened 'The Pub,' a name which it will retain forever. The rain, coming down straighter and heavier than ever, soon found its way through the thick foliage, and we had to move. We made a dash through the pitiless storm for a quarter of a mile, helter-skelter, to our never so pleasant old hut, dripping and dragged like barn-door fowls who couldn't or wouldn't go in when it rained. Monday was worse than Saturday—we fished all day in the rain without ever seeing a rise, for really there was nothing to rise at, and food was plentiful down below." And after all this was a sunshine holiday. It is the ability and adaptability to make the best of everything that comes that drives the wrinkles away, keeps a young heart in an old body, and in the case of an angler, as Sir Henry Wotton tells us, is "a calmer of unquiet thoughts, a moderator of passions and a procurer of contentedness."

That is slightly paraphrased, but it is true, and there are kindred qualities that Walton laid stress upon in the make-up of the contemplative angler the author of "Sunshine Holidays" seems to possess in an eminent degree, and he imparts something of these feelings to his readers, and they read his little volume with profit as well as pleasure.

The Triton's Dinner.

The Triton Club, of Canada, has so many members in and near Syracuse, N. Y., where the president, Mr. G. F. Gregory, resides, that they have organized themselves into the Syracuse Tritons, and annually they give a dinner to which all the Tritons are invited, and if you are a Triton it is worth going a good many miles to attend the dinner, where good fellowship, good stories, and good things to eat abound. The dinner this year was on March 14, and about forty Tritons gathered at the Yates upon the invitation of the Syracuse Tritons—Mr. L. C. Smith, president; Mr. M. C. Pierce, vice-president, and Dr. U. S. Brown, secretary. Mr. Seaton, the secretary of the Triton Club, came down from Quebec, and Mr. B. Frank Hall, the vice-president, came up from Pennsylvania, and other members came from other places, until there was a crowd of good fishermen at the Yates, each man filled with the fishing fever as stories were told, such as are told when fishermen congregate, of fishing past and fishing hoped for. Of the dinner itself, I would better say nothing, for it is eaten and done for, and it would only be an aggravation to print the menu after the dishes composing it were eaten. Filet of caribou à la Seaton still lingers in memory as the best caribou I ever ate, and even at this midnight hour I would like some fresh mushrooms on toast, but it only makes me hungry to recall the menu. The dinner was down for 8 o'clock, and it was 2:30 or 3 or 3:30 A. M. when the Tritons dispersed. On the wall in the dining room facing me was the stuffed glbs. trout taken at the club last year by ex-Mayor Kirk, and during the little sleep I got after I retired that trout seemed to haunt my dreams. As Mr. Kirk said at the dinner, the mounted fish is good in its way, but the real thing is a live fish on the reel.

The speeches made at the dinner were not recorded, although they were good enough to be preserved in the archives of the club; but I must rescue the verses on the menu from the pen of a Syracuse poet, written for the occasion:

Hail to the might that brings us here
Fraternal ties to tighten,
And to each friend and comrade dear
That knows the land of Triton!

Recalling many a famous day
We'll tell what we remember,
And what we're going to do in May,
Or else in cool September.

Then here's to hill and stream and fen,
And every forest rover;
And when we meet with Triton men
We'll pledge them three times over!

A Fishing Dog.

Everyone who has read the touching story of "Fish-in' Jimmy," by Mrs. Annie Trumbull Slosson, will remember that Jimmy lost his life in trying to rescue a dog: "On'y a dog? But he wa'n't jest a common dog, sir; he was a fishin' dog. I never seed a man love fishin' more'n Dash."

I met a fishing dog last year, and met him at the Triton Club, and as Mr. Hall, Mr. Walter Witherbee and I journeyed to Syracuse to attend the Triton dinner, Mr. Hall reminded me of the dog, for we were together when we saw him fishing. Old Jimmy's dog was one that simply took an interest in the fishing practiced by men: "Sitting in the boat beside his master, watching with eager eye, and whole body trembling with excitement, the line as it was cast, the flies as they touched the surface; his fierce excitement at rise of trout, the efforts at self-restraint, the disappointment if the prey escaped, the wild exultation if it was captured."

My dog was not that kind of a dog, for he fished for himself, and took not the slightest interest in the fishing by men. He was a spaniel, and looked like a well-bred dog, and when I first saw him he was fishing in Lac des Passes near the guardian's camp, and he belonged to the guardian. I regret to say that my dog was a lawless dog in his fishery desires, and apparently he did not aspire to trout, for he was fishing for frogs when I first noticed him, and he was fishing for frogs not from any sentimental or æsthetic reason, but simply to fill his empty stomach. He was a good fisherman too; in fact he had to be, for it was a ground hog case with him. When he captured a frog he waded ashore and ate it and returned to his fishing. Occasionally he would catch a small chub, and he caught chubs as deftly as he caught frogs and for the same reason, that if he did not catch them he would go hungry. No cat watched its prey more closely than that dog, and his movements in the water reminded me of the movements of a cat, they were so stealthy. He made scarcely any noise as he slowly waded in the shallow water, looking for food, and when he discovered it within reach he rarely missed seizing it in his mouth, showing that he had practiced the art of fishing, as he understood it, for a considerable time. It was interesting to watch him, but I could not help but feel sorry for the poor beggar that he should be reduced to such straits as frog and minnow fishing to keep him from starving, and I wondered what he would do for food when ice covered the lake, but perhaps the guardian is not above killing a caribou to keep the wolf from the door of the cabin, and that the dog in such a case would come in for a dividend in the form of scraps of meat. To tell the simple, unadorned truth, I was more concerned about how the dog would pass the winter than I was about the guardian.

Trout, Mink and Owl.

Last year, while fishing at Moise Lake, on the Triton Club tract, I came into camp one evening about sundown, and the guides having gone up the path to the tents I stood alone by the canoes fixing my rod, fly-book, etc., to put them away for the night in the tent, for a rod left outside may be gnawed by hedgehogs, or get wet by a rainstorm, and wet flies should be cared for and not be put away soaking wet, as they are taken hastily from the leader, when a change is made. As I was unjoining my rod, a mink came from somewhere and took a trout almost at my feet, and ran off with it. It was only one trout, to be sure, but we were living on trout and we killed only what we could eat from one meal to another, and we figured pretty closely as to the capacity of our guides and ourselves, and to prevent a recurrence of such a raid on our larder we set a trap for the mink and caught him two nights later. The trap was just at the head of our tent, and when the deadfall came down on the mink's neck there was a noise from the mink that could have been heard across the lake, and was continued until the mink was killed with a club. Speaking of this to Mr. Seaton, who sat next me at the Triton dinner, I said a small mink could make a very large noise when caught in a trap, and this reminded him of an experience on another Triton Club lake. He was just at the opening of his tent one nightfall after coming in from fishing, and his trout were just in front of his tent, when a mink came from somewhere, as mine did, and seizing a trout in its mouth made off with it, but before the mink was out of his sight a big owl swooped down and grasped the mink and made up into the air with it, and the last he heard of the mink it was screaming pitifully up toward the zenith.

Sounds in the Night.

This story reminded me to ask Mr. Seaton about another night occurrence. Mr. Rathbone and I returned to the Triton Club House from Moise Lake one afternoon and prepared for our return to our homes on the sleeper from Lake St. John to Quebec, which passes the club house station soon after midnight. Early in the evening after dinner we were both in the big parlor of the club, Mr. Rathbone reading in the middle of the room, and I was writing at a table by the windows looking out on the lake. It was moonlight outside, and after dinner we had walked around the club house and down to the dock, and had talked with our guides and the steward at the steps of the front veranda, and had been inside the house but a short time when we heard the yelps of a puppy in pain from the rear of the club house in the direction of the kitchen in the wing, back of which the guides' house is situated. There were two puppies about the place, cross-bred spaniels, fat and lumbering and perhaps 25 lbs. in weight. The noise from the one in agony seemed to travel from the rear of the house around the east end and in front, and ceased in a faint whine about opposite the windows facing the writing table where I sat. The candles burning on the writing table blinded me as I tried to look out of the window into the moonlit night, and I ran to the front entrance at my left as Rathbone ran to a western door opening out on a veranda which faced a ravine well wooded. I went around the front of the house and met Rathbone at the side piazza, but there was no sign of a puppy. Two of the guides came from the rear, and we asked what had hurt the puppy, and they said some

animal had carried it off, and they had heard the last of its cries over in the ravine growing fainter and fainter with distance. Asked what kind of an animal, they said a bear, which to me seemed absurd. The puppy must have been seized almost in front of the open kitchen door, where there were several club servants and one or two guides. Only a few feet away was the guides' house, forming with the kitchen wing and the front of the house three sides of a square. The bear must have come up out of the ravine on the west, and passed between the guides' house and the end of the kitchen wing, taken the pup very near to the open door and carried it out of the open square around the east end of the house and along the front to the ravine, passing the well lighted room where Rathbone and I were. I had two candles on the table close to the window and Rathbone had at least two reading lamps on the table where he sat. We got lights and looked for tracts, but could find none of bear or anything else, and as we left for the station before midnight that night the matter was a mystery to me and I assumed that the pup had hurt himself in some way and had run off into the woods and would show up next day, but Mr. Seaton told me that the pup was never seen after that night, and that it was in all probability a bear that carried it away, for a female and two cubs had been seen around the club house and another family of bears had been known to frequent the point in front of the house. It being true that a bear carried off the pup, for pure cheek I would back that particular bear. The pictures of the club house in FOREST AND STREAM of Feb. 26 do not indicate that it is a good place for bears, but the fact remains that the pup did not come back.

Scrod.

When I sat at my desk writing "Angling Notes" about a week ago to-night, I believe I said something about broiled scrod. Well, I have had some since then, and it was just as good as it used to be over in Boston. The night I reached Boston and when the veteran artist and salmon fisherman Walter Brackett and I were ordering our dinner at Young's we spoke of scrod, but as Mr. Burdick had not arrived I did not think it quite fair to take advantage of him and anticipate the breakfast we had agreed upon, so we ordered another kind of fish. Mr. Brackett said shad for the fish, and I accepted with a mild protest, but he knows Boston fish better than I do, for it was good, good as you can get anywhere unless you select your fish in the net and have it cooked as soon after as possible to get to a broiling fire. But the next morning we had the scrod all right enough, and that night for dinner when Mr. Brackett, Mr. Burdick and I sat down we tried rock cod for variety, and returned to scrod the following morning. The best fish I saw in Boston was on a canvas in Mr. Brackett's studio, and although he has painted many salmon so good that no other man can equal him in this respect, I think his very best was then on his easel. Mr. Burdick remarked that it was fresh-run enough to have sea lice on it, and certainly it had the sheen and coppery tint of a fish just from the water in absolute perfection of form and coloring, and it is wonderful that this man can transfer the king of fishes with such fidelity to canvas with brush and paint.

At the sportsmen's show a very charming Boston woman was good enough to take an interest in my fondness for broiled scrod and enlighten me upon the subject from her personal experience. She said perfect broiled scrod was not young codfish, but young haddock, and she said it in such a way that I know it is so without trying it; and hereafter in deference to her, if for no other reason, my broiled scrod shall be haddock. Moreover, this charming woman said to me confidentially that but few people who broiled fish knew how to add the butter to fish after they were broiled, and when she told me I asked that I might tell all the anglers through FOREST AND STREAM, and she gave her consent, and I shall always hold her in highest esteem, for I have tried her recipe, and it is as good as it sounded in the telling. Do not melt the butter on the hot fish, but melt it in hot water—boil it if you like, and when the water has cooled sufficiently for the butter to gather at the surface, partly solidified, skim it off and pour it over the fish, and there is no rank taste even if the butter is a little inclined to be that way itself.

Cod and Tomcod.

Every little while the daily newspapers print valuable misinformation about fish or fishing. They do not mean it for misinformation, quite the contrary, but they do mix things terribly at times. A correspondent sends me a clipping which tells of the capture of a tomcod with a tag. There is a picture of the fish with a tag like an express tag, or larger, fastened to its dorsal fin and bearing the number 360. The fins show that it is not a cod of any kind known to ichthyology, but the text informs us that it is a tomcod, captured and tagged by the U. S. Fish Commission, and when recaptured weighed 7½ lbs., which is a right smart weight for a fish that rarely grows to exceed 12 in. in length.

The text says that the tag was of copper, and a tag of that metal of the size represented in the picture would drown a poor little tomcod. The tagged fish was undoubtedly a codfish, for the Government does make a practice of tagging codfish, the same as salmon are tagged, to find how rapidly they grow, but no one thinks of tagging a little tomcod or frost fish, for it is known how large they grow, and how rapidly they grow is of no particular interest. It is doubtful if the U. S. Fish Commission hatches tomcods. The State of New York does, and last year nearly 45,000,000 were hatched at the Cold Spring Harbor Station of the Fisheries, Game and Forest Commission.

And that reminds me: A reporter on a Syracuse newspaper asked me how many fish of all kinds were hatched and planted in the State of New York last year. I told him in round numbers 213,000,000, at the same time I cautioned him that if he printed the statement to please see that the intelligent compositor used the necessary ciphers to indicate millions, for I had found on several occasions that similar figures were shy several important ciphers absolutely necessary to convey the truth as to

the number of fish planted. The next day the newspaper gravely informed its readers that the State had hatched and planted 2,113,000 fish in one year. How the figures became twisted around is beyond me to explain, for they were quite correct in the reporter's notes.

How to Gaff a Fish.

A correspondent asks, "How would you gaff a fish, by placing the gaff under or over the fish?" That would depend upon the fish and where it was at the time it was to be gaffed. Salmon are usually gaffed from the shore by placing the gaff over the back of the fish, but salmon are generally gaffed in water that is shallow, and it might be difficult to place the gaff underneath, although some anglers advocate gaffing salmon from underneath. Lake trout are as a rule gaffed when they are drawn to the surface, where the water is deep, and they are gaffed from a boat. For many years I gaffed my own trout, and always I gaffed them from underneath upward, for the reason that when a trout sees the gaff he will try to settle in the water, and naturally he settles on to the staff of the gaff, and a quick stroke does the rest. If the gaff is used from above downward the trout settles away from it if he settles at all, and yet I have seen many trout gaffed from above downward. I used to think I had to gaff a big trout near the tail, and many a time I have played a trout to get a tail hold with the hook, but as I have grown older I have grown less particular, and a safe rule is to gaff a fish, no matter what kind, where the hook will hold and the fish will not get away, and if this is done it will be the right way, whether it is from above or below.

Whitefish on Hook and Line.

Mr. Rowland E. Robinson writes me as follows: "About the middle of February one of our market fishermen who was fishing for perch and smelt in Flat Rock Bay caught a whitefish or lake shad of 2½ or 3lbs. It was taken in about 25ft. of water on a small hook baited with eye of a smelt. Our lake shad are so rarely taken on a hook that it is certainly worth mention. Lots of very large smelts are caught here this winter, more meat to the dozen, but not so toothsome as the little fellows."

It was very good of Mr. Robinson to take the trouble to write me about the whitefish, and in doing so he gave me some information previously unknown. He uses the term smelt in a way that would horrify some of my friends on the other side of the lake who persist in calling them ice fish. They know they are smelt, but they wish to possess a fish that is not known elsewhere, and so they talk and write of ice fish and ignore the term smelt. In fact a friend sending a box of the fish to me this winter said they were really ice fish, and he so marked the box, and not smelt, but I do not care what they are called if I only get them. I did not know that they were caught where Mr. Robinson indicates, as Lake Champlain people pretend to say that they are found only at Port Henry, West Point and Burlington. The small fish are usually considered best, but I have come to consider the larger they are the better. Talking with a fisherman this winter, he told me that the large smelt are never seen in the lake except just before the ice forms and after it has formed, but the smaller ones may be seen at all times during the summer, generally in the vicinity of a brook entering the lake. This helps a theory I have been trying to work out.

A. N. CHENEY.

Salmon Problems up to Date.

THE ways of the *Salmo salar* are past finding out. The salmon philosopher of any standing has long ago discovered that the more experience he seems to be accumulating in regard to angling and fishing lore, and the ways of the salmon generally, the less he seems to know. In short, he feels that the older he grows the more need he has of more and more exact knowledge, and the less and less conceited he becomes in his ideas as to salmon problems. But although this may assuredly be the case with most open and inquiring minds, yet there are some well-defined rules, the result of long and continuous observations, as to the migratory movements of the *Salmonidae* family, which the salmon philosopher will not readily give up without good cause. He will hold to his belief tenaciously, because it is not only founded on his own meager and perhaps intermittent observations, but it has also been the belief—traditional or otherwise—of other and more sage observers in times past. One of these popular beliefs has just received a severe shaking.

It has been so common an observation in past seasons that a good grilse season is certainly to be followed by a good early run of spring fish, and, conversely, that a bad grilse season is as certain to be followed by a bad spring fishing, that it has become a fixed rule among fishermen that when the one happens so certainly will it be followed by the other. In fact the law of cause and effect over again.

Now it may be remembered that last season's grilse crop was an entire failure, as far as the most prolific of Scotch salmon waters was concerned. There had not been such a poor show of grilse during any previous season within the memory of the proverbial oldest fisherman. But memory was not trusted to alone. Statistics kept regularly at most, if not all, the netting stations showed the same disastrous state of matters. Nor was the angler a whit better than the netter in regard to his head of grilse, but worse. From this it was concluded that the present spring would prove a very poor one in regard to the crop of early spring fish.

During the first two days of the present season over 1,000 salmon were netted on the Dee and adjacent coast stations between the first dipping of the net at 12 o'clock on Thursday night—or rather Friday morning—and 6 o'clock on Saturday night, when the Sunday slap intervened and put an end to the slaughter. Add to this that only a certain part of the Dee tidal is netted, and that a strong westerly gale prevented the full benefit of the coast stations being reaped, as it was next forenoon before all the leaders could be got in, and that the returns from them were very meager for the first day, and the full significance of such magnificent results will become more apparent.—*London Fishing Gazette*.

Boston and Maine.

BOSTON, April 28.—The weather, with a hard freeze and ice in the streams yesterday, and snow and hail today, has stopped a number of trout parties to the Cape. One company of four went down to Plymouth, to a trout preserve, on Wednesday. The weather was so cold that they did not try the trout at all, but were back in Boston to-day.

The legal trout season in Maine opens May 1, and one or two parties from the Hub will start by train Saturday night for trout waters that they know. The ice is out of the Schoodics, and landlocked salmon fishing has begun. No reports of catches are at hand, doubtless for reason of the cold and storm. Mr. Lyman Underwood will leave for the home of the Duck Lake Club on Saturday to put matters in order at the camps. Mr. Harry Underwood expects the Duck Lake party of fishermen this spring to number about thirteen, an unlucky number, but the boys, all Boston merchants and manufacturers, will take the chances about May 20.

The war is actually drawing from the ranks of the rod and reel sportsmen. One shoe manufacturer will be forced to stay at home from the Duck Lake Club party, for his partner is daily expecting to be called out; an officer in the militia. Another dry goods dealer expects four men to go from his store, and if they go, his spring fishing trip will have to be given up. At the Rangeleys a bigger business than usual is looked for by the hotel and camp people. The dangers of war promise to drive people to the mountains and inland, rather than to the seashore. It is reported that the Rangeley hotels and camps already have more guests booked than usual.

The Fish Commissioners are to give a hearing at the Rangeley Lake House, May 17, as to the proposition to close the whole Rangeley system to all bait-fishing after July 1 of each year. The summer guests at the hotels will oppose the action, but the sportsmen, who usually fish by trolling in the spring and with the fly in the fall, are strongly in favor of some action that shall stop the taking of trout by what is termed "baiting up" in the summer time. Deep water is selected, and minnows, chopped up, are thrown in for several days in succession. When the big trout have been tolled to these feeding grounds the hooks are brought into requisition, attached to 50 or 100ft. of line, as the case may require. In this way many beautiful trout are taken that have sought the deep waters to escape the heat. The petition to the Commissioners is directed more especially to the stopping of this sort of fishing.

BOSTON, May 2.—A number of Boston merchants and business men are much interested in the affairs of the Commodore Club, with club houses and fish hatcheries located at Moose Lake in Hartland, Me. Mr. John G. Wright has taken a good deal of interest in restocking that lake. He remarks that "Somebody is going to get some good fishing in the future, though we may not live to enjoy it. We have now in our hatcheries 30,000 landlocked salmon fry, hatched from eggs received from the State of Maine hatcheries at Orland last fall. The U. S. Government hatcheries at Green Lake also gave us 10,000 landlocked salmon eggs and 50,000 steel-head salmon eggs from the Pacific coast. These we have hatched, losing but a very small percentage. Then we have 30,000 brook trout fry, hatched from eggs from the State of Maine hatcheries. We shall hold and feed these fish till fall and then turn them loose into the tributary streams of our lake. In all, our lake has been restocked with over 300,000 salmon and trout since we began the work. A number of small salmon have already been taken there, and they are to be seen in large numbers at the inlets of the streams where we have put them."

Mr. D. H. Blanchard and his fishing friend, Mr. Keeler, are about starting on a fishing trip. They have both Lake Auburn and Lake Hebron, in Monson, in view. Mr. Blanchard has fished the Monson Lake a good deal and had good success there, but having heard of the good success at Lake Auburn, would like to try it. There is not much news of success at the big salmon pool at Bangor. Mr. John Caswell, of Boston, is there to give the salmon a try. After that he will visit Green Lake for a few days. Fishing has been reported good there. Fish Commissioners Stanley and Oak have just visited Sebago Lake for landlocked salmon. They are generally very successful there, both being "sportsmen that stick," but this time they have taken but very few fish. They have also fished Swan Lake and taken a number of the beautiful brook trout that lake is noted for, but no landlocked salmon. The ice is out of Lake Megantic, and Spider Lake is rapidly breaking up. Mr. L. Dana Chapman, treasurer of the Megantic Club, with one of the directors, will make a trip of investigation immediately, and have matters put to rights for the spring fishing. They also hope to get a few days' fishing. Sebec Lake, Me., is clear of ice, and salmon fishing has begun in earnest. The clearing of Grand Lake and Grand Lake Stream has started the Hoyt party off for those excellent landlocked salmon waters. In the party besides Mr. Hoyt are Messrs. Puffer, Slack and Holmes. Dr. Carrol, of Newton, is back from his fishing trip to Newfound Lake, N. H. He found terribly cold weather, with winds so high that it was almost impossible to be out on the lake at all. One evening his friend S. B. Bray, of Beverley, took two salmon of 5 and 7lbs. weight respectively. Dr. Carrol will try the same lake again as soon as the weather is fine. J. W. Sampson, of Hebron, upper end of Newfound Lake, has just reported a salmon of 13½lbs., taken there. Particulars of its capture were to have come in season for this letter, but they are delayed. S. J. Byrne, who managed the advertising and newspaper departments of the late Sportsmen's Show with so much success, with S. S. Hibbard will be off for Moosehead Lake as soon as the ice is out. They will fish Moosehead for a few days and then go to Northwest Carry. The ice is still hanging in Moosehead, as well as the Rangeleys; the clearing doubtless put back by the recent cold weather. Moosehead usually clears two or three days before the Rangeleys.

Henry C. Litchfield says: "Our old fishing friend Rowell, of East Andover, has been in to get his tackle put in order for the spring campaign with the black bass, in spite of the war with Spain."

The legal opening of the Maine trout waters, May 1, has started several Boston trout fishermen in that direction. On the Boston & Maine train Saturday evening there were six or eight rods, which were dropped off at several stations between Berwick and Portland. Early this week we may hear from them. Dr. Heber Bishop, with a fishing friend, has started for Maine. Doubtless he will fish the Rangeley waters as soon as the ice is out. C. P. Stevens will go down to his camp, Vive Vale, at the Narrows, Richardson Lake, as soon as the ice is out. He will remain there for the spring fishing. It is reported that A. C. Lombard, of Lowell, is to build a steam launch at Sunapee Lake, N. H., this season, and that several new cottages are to appear. Good fishing is looked for there.

SPECIAL.

CHICAGO AND THE WEST.

Bass Biting.

CHICAGO, Ill., April 30.—The bass are beginning to bite in good shape in Indiana. As early as week before last some strings had been taken in the Kankakee, and the fishing is still better now. Mr. H. A. Newkirk, of this city, writes me that he caught a nice lot of black bass at Cedar Lake, Ind., last week. The lily pads were not yet up. The weather was stormy, but Mr. Newkirk thinks that a few days of good weather would insure fine fishing with frog bait on Cedar Lake. This is one of the earliest bass waters about Chicago.

I should think that within the coming week one could have some fun with the bass along the Fox River in this State, if he cared to go out in the beginning of what is the spawning season on that stream. This is a lovely water, and the Fox at such points as Clintonville, St. Charles, etc., offers a nice place for a day's loafing and angling. It is about forty miles from Chicago, and the angler who is also a wheelman can spend two or three days very pleasantly by visiting the points above named in the early summer.

Trout.

Mr. E. G. Taylor, of this city, started this afternoon for Dudley, Wis., on his trout fishing trip, which will be of some duration. He promises to report the outlook on streams of that neighborhood. Thus far very few Chicago men have been out, and of course there never is such an exodus here as there is from the large Eastern cities on the opening of the season in Maine. We are not so blest with trout waters in this part of the world. But after all is said and done it is just as much fun to catch a little trout among little ones as it is to catch a big trout among big ones. It is all in the way you look at it.

A report from Parrish, Wis., states that on the first day of the season Messrs. J. Shepard and J. Hamlin had very good luck on streams of that neighborhood. Mr. Shepard caught nine trout, weighing 9lbs. 2oz., his largest fish weighing 1lb. 12oz. Mr. Hamlin had twenty, weighing in all 13lbs. 14oz. Their thirty-one trout weighed in all 23lbs. It is very rarely indeed that we hear of so large an average among the Wisconsin trout, and I am inclined to believe that it is due to the fact that the rainbow trout are becoming more numerous in many of the Wisconsin streams, where they have been planted by the Fish Commission.

To-morrow is opening day in Michigan, and many a rod will be busy soon after early dawn, I fear, in spite of the church-going bells. The southern peninsula of Michigan is a wonderful fishing country, and there is no place between the Atlantic and the Rockies which offers so good an opportunity for fly fishing in practicable streams. Soon we shall hear of the sport along some of these streams, had in the early days in the merry month of May.

Anglers.

This week the Western office of FOREST AND STREAM was favored by a call from Mr. C. H. Ames, of Boston, Mass. I regret very much that at the time of Mr. Ames' visit I was out looking for a boarding place for a dog, and so unfortunately missed him. Mr. Ames was, however, conducted through the principal parts of the establishment, and was shown the Kekoskee fish story medal and other articles of vertu which have blown in here in the course of the years. Mr. Ames, I recollect, was one of those who took great interest in the legend of Kekoskee, and had I been able to meet him it would have given me pleasure to conduct him to that very spot in Wisconsin where the incidents perpetuated in the legend actually occurred. He should have stood upon the very bank, once slippery with the tails of myriad bullheads. Nay, he should have gazed at that very spot whence burst forth that eruption of virile bullhead life that brought fame to an otherwise obscure village in the heart of a distant land. I know Mr. Ames would have enjoyed seeing that historic spot, just as I myself should enjoy visiting Bunker Hill. There is no difference between Kekoskee and Bunker Hill except that Kekoskee has no monument. That is to say, it has no monument builded of stone and mortar, though above it towers imperishable the record of its greatness. I am sorry Mr. Ames did not get to see Kekoskee.

Mr. Emile Pragoff, of Louisville, Ky., was another among the callers at the FOREST AND STREAM office. Mr. Pragoff is in the sporting goods trade at Louisville, and is a devotee of the rod and gun also in an amateur capacity, being especially fond of fishing. He tells me that one of his favorite bass waters, out of all he has ever tried, is the Cumberland River up toward its head. To reach this stream necessitates a long ride by rail from his city, but the trip is worth it, for it takes one into another world. Here the inhabitants are the quaint and primitive hill dwellers of whom so much has been written in current fiction and truthful narrative. Mr. Pragoff says that up in that country the people live as they did before the flood, trusting mostly to the good offices of nature. They have but the rudest of dwellings, and how they make a living from their tiny and ill-titled fields is something never fathomed by an outsider. The cabin has but one room, and here the whole family sleeps. Mr. Pragoff says

that he has thus slept in a room where eleven persons, adults and children, found beds in some mysterious manner. The cookery is very poor in such a home, but the people are generous and will give you anything they have. The moonshine industry is by no means extinct in those mountains yet, but it is not now so dangerous to go into that country as it was not long ago. The man who goes in there and tends to his own business and does not ask any questions is all right. Yet even the most industrious angler is an object of curiosity if not suspicion, for the inhabitants are utterly unable to believe that any sane man would come up into that country for the purpose of fishing and nothing else. They follow the angler along the stream, watching his actions with wondering eyes. Plainly, so it seems to them, a man must be crazy who will wade in the water when he goes fishing. Yet the bass angler who wades the upper Cumberland at times when the water is clear and not troubled by the wash from the steep mountain sides is very apt to be repaid by good baskets of the fightingest sort of small-mouth bass.

In the Pine Woods.

That energetic young hustler Fay Buck, of Manitowish, Wis., writes me that he and his father now have three resorts open on the Spider Lake, Turtle Lake and Manitowish waters, and all the camps are connected by telephone, so that any one at either of the camps may telephone to any other camp or to town. This means a great saving of time and expense to guests and will add to the popularity of these first class fishing resorts, all of which will open May 1, though the bass fishing does not begin until May 25.

Mr. H. G. McCartney, proprietor of the now well-known Minnesota resort, Kabekona Camp, on Woman Lake, has brought out a very neat and fetching little novelty in summer literature this week. I say literature, for though there is not a word of text, the twelve Kabekona photographs speak each a potent language. The views show different scenes among the tidy log cottages and give the lake front view of the camp also, together with fine landscapes of some of the mightiest fishermen who have visited that favored spot. There is a view of a canoe on the water, a picture of the bark palace of old Bungo Buck, the Chippewa outlawed Indian who has taken up with the white men because he can't live with the red ones unless he kills one or two of them every day; moreover, there are the public documents of strings of great muscullunge, which ran up to 41lbs. last season. I have heard doubt cast on the Kabekona average by men who have never been there, but Mr. McCartney personally told me that during the last part of the season, when the large fish were biting, the average of total catch at that resort ran over 20lbs. in weight. It was rare to take one so low as 10lbs., and I understand that there has not been one brought in at that resort which weighed less than 9lbs. It is certainly pretty good lunge country. As to the bass, it is not fun to catch them, I am told, because they are too numerous to offer any difficulty to the angler. A good big market-fishing outfit was just about to drop in on that chain of lakes two years ago, having put up their ice houses and made every other arrangement to begin cleaning out those waters, when they were confronted with the Minnesota law forbidding the taking of black bass for the market. Also, Mr. McCartney dropped in on that chain with his happy idea of a sportsman's resort, and so the riches of those still unexhausted waters were left assured for many years to come. I should add in passing that Mr. McCartney is going to put his little Kabekona view book on sale this season up at his camp, so that an angler may show the proof of what might otherwise be considered fiction. The tidy little collection is bound in permanent form.

Prizes in Angling.

That there are prizes in angling would seem to appear from a look at the programme of the San Francisco Fly-Casting Club, who will give a grand tournament Sept. 9 and 10. In each of the eight events the winner will receive a \$75 diamond medal, and there will be \$1,250 worth of merchandise prizes.

I have often gone on record in regard to the merchandise idea in amateur sport, giving it as my personal belief, not of much value, that no sport is ever benefited by the old-fashioned plunder list, nor is any giver ever benefited by a gift of such plunder for such purposes. So much for what it may seem to be worth. I wish, however, to qualify my remarks upon the general subject of merchandise prizes in angling circles. I confess that I have discovered one instance of a merchandise prize received by an angler under circumstances which command my absolute and unqualified approval. Indeed, so seemly and fit do these surroundings seem to me that I will go further and say that under no other except similar circumstances should any angler ever take unto himself any merchandise prize. This instance it is my duty to give as recorded when it first came to my attention. It was down in Missouri, and a Missouri paper describes it as follows:

"Robert Bryson, while fishing near the mouth of Buffalo Creek, instead of a fish landed a pair of pants, in the pocket of which was a roll of bills amounting to \$23. Owing to a protracted stay in the water the greenbacks were hardly recognizable, but they will, however, be sent to Washington for redemption."

I consider a merchandise prize received under such circumstances as the above to be not only entirely legitimate, but indeed highly commendable; for not only did Mr. Bryson earn his increment by his skill as an angler, but by the same act he saved a worthy pair of pants from a watery grave.

E. HOUGH.

1206 BOYCE BUILDING, Chicago, Ill.

Ohio Bass Waters.

HUNTSVILLE, O., April 25.—Black bass began taking minnows here on April 16, and since that time many large catches have been made by Cincinnati anglers. Of the strings taken by E. W. Ellis three weighed 15lbs. Lewis A. Davison took one of 5½lbs. The fishing is in "Indian Lake," a new name for Lewiston Reservoir. A recent writer in the Georgetown Gazette says of these waters: "The Reservoir, to the visitor, is of great in-

terest. It is just six miles from Huntsville, in the north-western part of the county, and is a great sight, with the thousands of stumps of trees projecting from the water, the many fishermen in boats landing large fish every few minutes, and the constant roar of the water as it rushes through the bulkhead to come in contact with the thick, muddy water of the Miami Canal. The "pond," as it is called, covers 16,000 acres of territory, which includes the islands and waste land. That it is a great resort for fishermen and hunters is proven by the fact that last year 64,000 people entered the gates of one of the resorts, Lakeridge, and so far this year 58,000. This does not include those gaining access to the pond by way of the other resorts, nor by the public roads which run to the Reservoir. The resort spoken of, Lakeridge, is managed by W. E. Clarke, and is an ideal place to spend a week or so in hunting and fishing.

"Bass, ring perch, cat and sun are the most numerous, and are taken in great numbers during the season. A string of twenty or thirty is an ordinary sight, but before gaining much of a reputation as a fisherman you will have to double that number, and even then you will not be the cause of much comment, big catches being the rule, not the exception. The fish run ¾ to 7lbs. each, and the bass are said to be especially fine.

"The Reservoir, with its waste land and islands, is a great feeding ground for wild ducks, and in season they are killed by the hundreds. A good marksman can easily land thirty or forty fine specimens in a day. The fare from Cincinnati to the Reservoir is \$4 the round trip, which is the rate given all hunters and fishermen by the Big Four."

The Rainbow Trout in England.

THE rainbow trout (*Salmo irideus*) was introduced into Great Britain in 1885. They were not very successfully bred, nor did they attract much attention for some years following. In a recent essay by Mr. Wm. Senior, read before the Piscatorial Society of London, the past, present and future of the fish are thus discussed:

I have not carried my researches any further, my object being merely to show how the rainbow trout was introduced into this country; and by this time, viz., in 1895, the cultivation, and, I presume, distribution of rainbow trout was being made a regular business by most of the fishculturists of the country; and it will be seen by the fishcultural advertisements of the present day that there is scarcely a hatchery that does not supply them. I think much of the caution which has been recommended in the introduction of rainbow trout to rivers is traceable to the fishculturists themselves. The old hands among them had paid pretty dearly for the enthusiasm worked up over the *fontinalis* when it was first introduced into this country. Nothing could exceed the rapture lavished upon that fish. Everything was to be revolutionized; the *fontinalis* was to be the trout of the future. There is no need to enter into the history of the movement, but the *fontinalis* is not the trout of the future, but is, I think, with us at any rate, the trout of the past. He was confidently recommended for both river and lake. His enthusiastic admirers were prepared to back him against our own wild brown trout, and the boom of the *fontinalis* was a most pronounced success. People bought them right and left, and put them into their rivers and lakes, and then it was found that they disappeared from the rivers, and after giving perhaps a couple of seasons' sport in the lakes became sulky and non-sporting. Some of the fishculturists, therefore, have remembered this, and, I expect, resolved to avoid a second mistake if possible, though it was no special mistake of theirs, as they were pushed on to a boom of the *fontinalis* by enthusiastic admirers from the outside.

It has been shown from dates that we have had the rainbow trout bred in our public hatcheries and put in the market for ten years and over. There must have been hundreds and thousands of them distributed in our waters, but up to this moment, so far as I know, anything like adequate evidence of their success in a trout stream is wanting. For lakes and ponds I should say the rainbow trout is the best fish we know of to-day, for he grows rapidly and gives sport, though whether, like the *fontinalis*, after awhile he will become sulky and belie his own character, is a matter which time only will prove. But it is certainly strange that during the ten years we have been told so very little of results.

The general question uppermost in the minds of all of us is, no doubt—What is going to happen? Is the rainbow trout to be the trout of the future, and by its size and gamesome qualities to compensate us for the over education of our native fish? I wish I could answer that question, but I cannot. I have some very good friends who are inclined to think that the rainbow trout will not prove the disappointment which the *fontinalis* has done, and there are others who still maintain their attitude of reticent observation, and are waiting for definite facts. Meanwhile the angling associations of the North have just taken to action, and are stocking with rainbow, so that we shall in due time get our evidence. Anyhow I am sure the rainbow trout will have a perfectly fair, if not an enthusiastic, trial. I believe if it could be clearly proved that the introduction of rainbows into four, five or six of our trout streams had been successful—that is to say, if they had remained in the streams, increased in numbers, risen well in their third season—there would be little more doubt about the matter. This all beside the mark to tell us of the magnificent size the fish repeatedly grew to under artificial conditions. That is a matter of course, and it may be accepted as beyond dispute that the rainbow trout have answered well in lakes and ponds. There are hundreds of pieces of private and public water in the country at the present moment that are practically waste, and that by slight trouble and expense might be stocked with these fish. But we are slow to move, and although the cultivation of waste waters has been urged again and again, it is only occasionally that we hear of a venture being made. Let us by all manner of means give the rainbow trout a perfectly fair trial; for I end as I began, by saying that our only object can be to improve our fishing, and make our stock of sporting fish, if possible, the best in the world. Let the best fish, like the best man, win.

Pike in the Connecticut.

'CHARLESTOWN, N. H., April 23.—*Editor Forest and Stream:* A letter in FOREST AND STREAM a short time since called attention to the variations in the supply of fish in Plymouth Ponds, Vt., the head of Black River, which passes through Ludlow, Cavendish and Springfield to the Connecticut. The inclosed letter from the old veteran gunsmith at Bellows Falls, Mr. Brockway, throws some light on the original stocking with pike. For "Ludlow" read "Plymouth" in his letter, as the ponds in Ludlow are merely mill ponds, caused by dams. No pike had ever been heard of in Connecticut River when I left home in 1841; but a year or two after, when home on a vacation, I heard of the capture of two large "Lake Champlain" pike at Morris' Mills in Springfield, about three miles above the mouth of Black River. The next year I heard of the taking of that large one at Bellows Falls, but think it was in 1844. As I devoted my vacations solely to brook trout, I did not pay much attention to the matter, except to try and find out where they came from, when I was told that some one in Vermont had stocked the ponds at the head of Black River, and the fish had worked down. Yellow perch were always plenty in the Connecticut, and the mouth of Black River was one of my favorite fishing places for them when I was a boy, more than sixty years ago, before I was weaned from all other fishing by the delights of the trout brooks. The perch must have worked up Black River from the Connecticut some time, but I doubt if it has been within the memory of man.

My friend the late Commissioner E. B. Hodge insisted that the yellow perch were great spawn-eaters, and attributed the discovery of the "Sunapee saibling" in 1881 to the destruction of the spawn-eating perch by the black bass, which had been introduced in Sunapee about 1870.

I think it most probable that the scarcity of pike in Plymouth Ponds at the present time is due to a want of food. The ponds are not very large, and the pike have probably cleaned them out gradually, and then "cleared out" themselves. They are moderately plentiful here in the Connecticut, as are the smaller "pickerel," but they do not leave much of anything else! Glad to see the illustrations of the family in friend Cheney's last letter.

VON W.

BELLOWS FALLS, Vt., Feb. 1, 1898.—Samuel Webber, Charlestown.—Dear Sir: I wrote you last winter about the pike in the Connecticut River; I have also written to all the parties I thought might know about it, and have a letter from Dr. Charles A. Scott, of Tyson, Vt. He is an old man, and has always lived near there, and he writes me that in 1828 one Jephtha Spaulding went "over the mountains" to Lake Champlain, brought them over and put them in Ludlow Pond. His expenses were paid by subscription raised among the neighbors, and after this they were put in other ponds around there. He thinks they killed out the trout in those waters. This is the best account of the fish I have, and it agrees with the facts we have here, that they come down Black River, and were caught in the stream before any were caught in the river. They were taken here about 1840, and Henry Hill caught the first big one that weighed 18lbs., and Mr. J. K. Wales, of this place, helped to carry it about town to exhibit. My own fishing memory dates back to 1848, and I have caught many pike myself. They seem to drift down the river, but don't work up stream much, as the most northerly point they strike, of which I have knowledge, is in Claremont at a place called Toad Hole. They are caught down the river by Springfield and far to the south of this point, and called "muscalonge." I have never seen one of this species in this river, though I was in Springfield some years. They think down the river that they come up stream, but I do not agree with them. Yours truly,

N. S. BROCKWAY.

Black Bass in Southern Waters.

BIRMINGHAM, Ala.—*Editor Forest and Stream:* I have just read in the issue of April 9 in Mr. Hough's article a reproduction of a letter from Dr. Neely, of Cookville, Tenn., which causes me to take up my pen, as the subject is one of special interest to me. Having had considerable experience in using the fly in fishing for bass in some of the streams of Tennessee, my whole aim is to be of more service to Dr. Neely in his laudable desire to join the craft.

What Mr. Hough says of tackle is true in most instances, in all I might say, except where the party concerned has an almost unlimited supply of the needful. So I would say to the Doctor, if he is indeed earnest about "jining" the craft, go shy of cheap tackle, especially flies, rods and leaders.

I would suggest that one carry guide rings with him on his trip, also a spool of silk and bottle of rod varnish in case of losing a ring. In my opinion there are more rods broken for the lack of a ring on the tip or second joint than from any other cause. Last season I saw a tip smashed on an expensive rod for the lack of two rings. Of course the maker came in for some remarks about swindling, etc., when all the fault was with the user. I do not care how much you pay for a gun or rod, unless it is kept in condition and taken care of it is no better in the end than something cheap, only that it will stand abuse longer.

I prefer my flies tied on Pennell's turned down eyed hooks, No. 4, for bass fishing. If I cannot get these I would take them on Sproat, same number of hook. My experience is that the flies tied and sold as black bass flies are entirely too large. There is certainly no reason for using them that I can see. They are much more difficult to handle except with a very heavy rod, and I do not think under most conditions that the fish rise to them as well as to the smaller flies. The largest bass I ever landed with a fly was caught with a fly tied on a No. 6 Sproat hook. The flies I have found most successful in the waters of Tennessee and Alabama for early spring and summer are the silver doctor, the oriole, the royal coachman and the bucktail. The latter is particularly a killer in the last part of July. For fall

fishing I prefer the darker colored flies. I have had more success in the waters of the States named in the months of September and October than in any other part of the season.

As for learning to cast the fly, the only thing I can advise is to read any of the authorities on the subject, master the theory, then go to work to educate the muscles and senses to perform it. Of course one would learn much more readily if he had some one to coach him, but with patience he will learn anyway, and when he takes his first bass on the fly he will think himself fully repaid for his labor.

Waders are a nuisance anywhere, and in our climate are unnecessary. An old bicycle suit with a pair of hob-nailed shoes I find is the thing for me where I can wade. I carry a short-handled landing net with a piece of leather worked with a button hole tacked on the handle. This is buttoned on one of the suspender buttons on the left side.

As for casting the bait from a free running reel, the novice will have to learn this, as he does fly-fishing, by practice after mastering the details as laid down by some of the authorities. In my case this was more difficult to learn than fly-casting. In fact I have never become an expert, even after some years of practice. I think every angler should know something of bait fishing, for there are times when fish will not rise to the fly, and I am not such a crank that I think camp should go without fish just because they do not happen to like an insect on that day. There is much more sport in taking the fish with the fly, but suppose he will not bite; why, try him with something else. I have found the little casting spoons, the Skinner spoons, of great help to me under such circumstances. I use the No. 1 with a 2ft. gut leader. There is no such great difference in this from casting with the fly. The spoon is taken under the water, and of course you miss the savage rush to the surface, but a bass will fail to show himself after he is hooked, and give you plenty of sport. The small spoon can be used with the fly rod. In bait fishing I have found nothing to equal the live minnow in our waters. Helgramites and frogs are scarce articles at best with us.

I hope Dr. Neely will not think that I am trying to advise him in this without having been asked; for the truth of the matter is that reading the article suggested to me that there might be many in the South who would like to know more of fly-fishing in the waters of this State and Tennessee, and this is written to give them all the information in my possession. ALABAMA.

Winnepesaukee Lake.

Editor Forest and Stream:

There may be more beautiful lakes than this New Hampshire gem somewhere in the world, but a lovelier body of inland water is not necessary to satisfy any one.

The combination of numerous islands, broad bays and irregular shores, with the grand view of the distant mountains, make it one of the most enjoyable places to visit. The natural beauty of Winnepesaukee is not the only attraction, especially to the sportsman. The lake is well supplied with fish; trout, bass pickerel and yellow perch are to be found in great numbers.

I have never failed to secure a reasonable number of bass at this lake, and I have spent several weeks there each season for the past three years. Early in the season, say June 15 to July 15, the fly is the proper lure, but from then on bait fishing must be resorted to. Deep-water trolling for trout and still-fishing with minnows or helgramite for bass.

There are several particularly good places where bass may be found, but a stranger would not always be able to strike good fishing grounds unless he had the points given him.

A branch of the Maine Railroad System which runs from Boston to the White Mountains passes close to the western shore of this lake, at The Weirs, and it is at this point that the tourist or sportsman can best make his headquarters, as it is the most convenient for visiting the various points by steamer or rowboat.

A narrow channel connecting this lake with a smaller, Lake Panguis, is within five minutes' row from The Weirs. This channel or river is not over a half mile in length, yet hundreds of pounds of bass are taken from it each year. Last summer I saw a string of twenty-three, caught by one man in an afternoon, which weighed 51lbs. There are other places equally as good which can easily be reached from The Weirs.

It is not at all surprising that there are numerous resorts on the shores of this beautiful lake, or that the picturesque islands and shaded hillsides are dotted with cottages and sportsmen's camps.

If any FOREST AND STREAM reader should conclude to spend a few days or weeks beside this marvelous sheet of water this summer, and I am there, as I hope to be, I shall take pleasure in pointing out to him the spot where I hooked and lost the biggest bass of the season, and where I landed many. DOCTOR.

PHILADELPHIA, Pa.

"More About the Black Bass."

ALBANY, N. Y., April 30.—Editor Forest and Stream: I see that you printed my note of April 23. I will add: The regiment of volunteers now being raised by Col. J. Meredith Read in this city cannot be accepted in this first call because the National Guard will fill the bill; but we have on our rolls over 600 men ready for the next call. I started a company in Rensselaer and one in St. Lawrence county, and have been appointed lieutenant-colonel of the regiment. I leave for Brooklyn to-night to continue recruiting there and incidentally to resume my fishing articles, hoping that the Governor, or the President, will call us soon. Will give you "more about the black bass" next week. FRED MATHER.

The Castalia Club.

TOLEDO, O.—The Castalia people (upper club) had an unusually successful opening on the 15th ult., with large catches. Ex-President Cleveland will be the guest of one of the members on the upper stream May 5. J. BEEBE.

The Kennel.

Hunting the Big Cats of the Rockies with Hounds.

THERE exists among sportsmen a general misapprehension as to the habits and characteristics of the big cats of North America.

The blood-curdling screech and ferocious attack of the panther, lynx, or wildcat has been harped on so often by writers knowing comparatively nothing of their subject that the average man feels that he takes his life in his hands when hunting them.

As a matter of fact, the panther, cougar or mountain lion (*Felis concolor*) is the only one of the three that is apt to become the attacking party, and this only when hard pressed.

As they are nocturnal animals, it is a difficult matter to hunt any of these cats successfully, and the only way that it can be done is by the use of trained dogs. Foxhounds are by far the best dogs for this kind of sport, and while they require special training and much time to fit them for the work, a well trained pack of six or eight dogs can chase and capture lion, lynx or wildcat with reasonable certainty. It is commonly supposed that dogs have an instinctive fear of the cougar, but as far as my experience goes this is a mistake. As the wildcats travel and hunt mostly by night, lying in cover, generally in rough and rocky country, where scent does not lie well during the day, much of the work done by the dogs is cold trailing of the most difficult character. Here in the West, owing to the dry climate, scent does not lie well unless the ground is either frozen or covered with snow, and for these reasons nearly all such hunting must be done during the fall and winter.

The cougar has a preference for rocky or broken bad land country, where his prey, either domestic animals or game, is to be found. Parts of Colorado, Wyoming and Utah fairly swarm with cougars and they are very destructive to horses, cattle and game.

In hunting cougars with dogs, it is the practice to start in the morning, keeping the dogs coupled, and find the trail or other signs of a cougar before turning loose.

This is rendered necessary by the fact that there are always more or less of other animals, such as wildcats, coyotes, badgers and wolves, in a country that cougars inhabit, and if the dogs should jump one of these before a cougar track was found, good-by to cougar hunting for that day.

When it is intended to shoot the cougar when treed or at bay, no other dogs than foxhounds are needed, but when the dogs are left to kill the cougar unaided, two or four foxhounds and three or four powerful fighting dogs are required, as foxhounds, while hard fighters when things are going their way, have neither the weight nor courage necessary to pull down and kill a full-grown cougar, except in large flocks. I have found that cross-bred dogs, such as collie and staghound or foxhound and mastiff, are very good for this purpose, though we have other cross-breeds that are excellent at this work. I have just got a Great Dane as an experiment, and shall likely try bloodhounds as cold trailers before long.

The length of time that elapses between putting the dogs on a cold trail and getting the cougar up is very uncertain. When his game is plentiful a cougar does not travel much, as he is fat and lazy, but sometimes from lack of food or other causes a cougar will travel twenty-five miles in a night, and then a long, weary day's work is ahead of the hunter. A cougar catches his game by stalking it as closely as he can, and then rushing, and after he has pulled it down will drag the carcass to some secluded place. Here, after making a meal, he covers the remainder of the meat with leaves, twigs and dirt, and will stay within a few hundred yards of the spot as long as his food lasts. This habit makes him easy to get, as it is possible to turn the dogs on a trail a couple of days old, the chances being that they will jump the cougar within a few miles.

On the approach of dogs a cougar nearly always takes to a tree, though it will at times come to bay on the ground, and will at long intervals attempt to run before the hounds.

As a cougar is very short-winded, he must, unless the ground is bad and the scent poor, succumb after a short run.

Well trained hounds will, on the cougar being treed or brought to bay, remain barking at him for hours, until the hunter, who may have been miles behind, comes up.

Sometimes the engagement which follows is, while it lasts, a lively fight, and for the time required to get the cougar down there is an animated whirlwind of dogs, with a very much bewildered cougar in the vortex.

The gray lynx (*Lynx canadensis*) furnishes finer sport in some respects than the cougar. Possessed of the cunning of the fox, and leaving very little scent, the soles of his feet being covered with fur, a lynx will escape from any but old experienced hounds. Inhabiting the higher ranges of mountains, the lynx stays in the spruce timber, where snowshoe rabbits, his favorite food, are plentiful.

As it is almost impossible to hunt lynx successfully before snow falls, very few sportsmen have ever killed one.

Lynx are hunted in much the same way as cougars: that is, by finding a track before turning loose the dogs. As a lynx will often jump from one tree to another, and has a great habit of walking logs, it is slow work for the dogs to jump one, thus making it possible for the sportsmen to keep right up with the dogs. Half the fun of hunting with hounds being in watching them puzzle out a tangle in the trail, lynx hunting, in this respect, is ahead of cougar hunting.

On being jumped, a lynx makes quite a run, often staying ahead of the hounds for hours, and sometimes escaping altogether, being enabled to do this by the poor scent it leaves. If unable to keep ahead of the dogs, a lynx always trees, as it does not seem to have the courage to face its pursuers on the ground.

Lynx must almost always be shot from the tree; it is nearly impossible to get one to jump out while the

dogs are below. They make a very poor fight against dogs, and some powerful fighting dogs will kill a lynx almost instantly. A single dog to be able to kill a lynx must be able to stand punishment without flinching, as the lynx on closing with a dog will make all four sets of claws fast in the dog's head, at the same time making his teeth meet through an ear or cheek. A dog used to this style of fighting will disregard such slight hindrances, and getting a good grip on the lynx's chest kill it dead at one crunch. The lynx being a slim bodied animal, a dog can always get a fatal hold at the first dash, if he understands his business.

But for all-round fighting qualities the wildcat or bobcat, as it is called in the West (*Lynx rufus*), is far and away ahead of either cougar or lynx.

If the cougar had the courage and ferocity of the wildcat, hunting him would be more dangerous than any other sport that we have. The wildcat knows not fear, will fight to the last gasp and only his small size prevents him from killing dogs as fast as they come, or from being the hunter more often than the hunted.

A full-grown wildcat will give a dog plenty of exercise in mastering him, and the dog always comes out of the encounter more or less marked up.

I have seen a wildcat back up under a rock and stand off half a dozen foxhounds, and then, when one of the fighting dogs rushed in, the cat would fasten on with teeth and claws, never giving up his hold until his life was crushed out.

As the wildcat is often found in a country where no other game but rabbits and birds live, it is possible in hunting them to turn the hounds loose to find their own trail. The scent of a wildcat under the most favorable conditions does not lie more than four or five hours, and is poor at the best.

The best sport I ever had with cats was when engaged, in company with Mr. A. G. Wallihan, in photographing them.

Near the ranch was a tract of stunted cedars some ten or twelve miles in diameter, furrowed with shallow rocky gulches, and an ideal place for cats. As there was no other game to bother, we used to turn the hounds loose as soon as we started, and it would not be long before a short, impatient yelp from one of the older dogs would betoken that the last night's trail of a cat had been found. Gradually, as the other hounds gathered in, the eager snuffing and low barks would gather force, until the entire pack burst into full cry, and the cat was away.

If the tracking was extra good a short run would bring the chase to an end. But if the trail was at all bad, or the ground rocky, the cat would run ahead of the dogs for hours, making all the turns and doubles possible. When hard pushed, it was even up whether the cat would take to a tree or come to bay on the ground, though sometimes one would take refuge in a rabbit or badger hole, or crevice in the rocks. When we got one up a tree we would, if possible, photograph it, but if the position or light was unfavorable, would poke the cat out. The cat would nearly always jump clear of the dogs and get quite a start. On several occasions we had a long chase before we could tree the cat again. Once by setting the camera to command the ground where the cat was likely to run we got an instantaneous photograph of the cat in full run, with a couple of dogs in hot pursuit.

Photographing wild game in rapid movement is, however, disappointing work, as very often the photograph gives to the observer no impression of speed, but has an unreal appearance. WM. WELLS.

WYOMING.

Open-Air Show.

THE New England Kennel Club will hold the first open-air show of the season of 1898 on Saturday, June 4, at Brookdale Farm, the home of the New England Kennel Club, at Braintree, Mass. It will be a one-day show, under the rules of the A. K. C., and recognized by that body, so that wins will count. The entries will be \$2, with first money \$4 and second money \$2, in all open classes, and \$3 and \$2 in novice and limited classes.

The premium list, which will be out about May 1, will include all the popular breeds, and the following will be provided in most cases, with classes for dogs and bitches: Puppies, novice, junior, open; and in some terriers an American-bred class will be opened.

Specials are coming in very well indeed, and specialty clubs are requested to send in their special premiums as soon as possible, so that the premium list may be very complete.

The following gentlemen have promised to judge for us: Mr. James Mortimer, Mr. Arthur Mulvey, Mr. George W. Lovell, Mr. Harry W. Lacy. Mr. Rutherford has been requested to judge fox terriers.

Last year's open-air show, although only a local show, was a great success, and this year, as the show will be under A. K. C. rules, the committee expects that every one interested in the improvement of the different breeds will co-operate with the N. E. K. C. in making this somewhat unique departure a fixture by filling the classes thoroughly.

There will be a special train from Boston to Braintree on the morning of the show, on which exhibitors will find full accommodations for themselves at usual fare. Their dogs will be transported on the same train free of charge. The train will remain on the club's siding adjacent to the grounds, and return in the afternoon in time for every one to get an evening train out of Boston. The committee is composed of Morton E. Clapp, Chairman; J. L. Little, Jr., Treasurer; Roy B. Baker, Secretary. All communications should be sent to Roy B. Baker, secretary of open-air bench show committee, New England Kennel Club, Braintree, Mass.

Metropolitan Kennel Club.

NEW YORK, April 29.—Editor Forest and Stream: At a meeting of the Metropolitan Kennel Club held on April 27 it was decided that the club hold its third annual dog show during Thanksgiving week next, in Brooklyn.

National Beagle Club.

APRIL 27.—An executive committee meeting of the National Beagle Club of America was held at 171 Broadway on Tuesday, April 26. Messrs. Geo. B. Post, Jr., Jno. Bateman, Jas. W. Appleton and G. M. Wharton were present. The treasurer reported the finances of the club in a most satisfactory condition. A. Henry Higginson, of Boston, and J. T. Volkman, of Webster Grove, Mo., were elected to membership.

The chair appointed a committee for the revision of the by-laws, etc.

It was decided that the field trials for 1898 be held the week beginning Monday, Oct. 24.

G. MIFFLIN WHARTON, Sec'y.

American Dachshund Club.

CHICAGO, April 26.—The American Dachshund Club will hold its next annual meeting May 19 at 8 P. M., at 715 Farwell avenue, Rogers Park, Chicago, Ill., to transact its regular business and elect officers for the ensuing year.

Votes for officers and delegate to the A. K. C. should be sent to the secretary by mail by those who are not able to be present at the meeting.

Any suggestion any member or friend of the breed may make in the interest of the club and our breed will be thankfully received and considered at our next meeting.

ARTHUR FROEMBLING, Sec'y.

218 STATE STREET.

Yachting.

A MEETING of the Council of the Yacht Racing Union was held in New York on April 30, there being present Chairman Louis M. Clark, Sec'y F. B. Jones, Treas. N. D. Lawton, and Messrs. Oliver E. Cromwell, A. J. Prime and A. D. F. Bancroft. Mr. Jarvis was expected, also Mr. Duggan, but both were prevented by business. The question of a new rule of measurement to be recommended by the Council for adoption in the fall was discussed throughout a lengthy session, but no decision was reached.

FROM reports which are apparently reliable it appears that Spain is making a special effort to capture some of the large American steam yachts now about the Mediterranean. On April 27 the Spanish torpedo-boat destroyer Destructor sailed from Cadiz, accompanied by the torpedo boats Barceola, Habana and Retamosa, heading east for the Straits of Gibraltar. Their special mission, as reported, is to look for American yachts. It is also stated that the fast British steam yacht Giralda, recently purchased by Spain, will be devoted to this object, her speed of 22 knots making her capable of overhauling any of the American yachts. On April 30 it was reported from Toulon, France, that the American steam yacht Namouna, James Gordon Bennett, while en route from Cannes to Marseilles, was chased by several Spanish torpedo boats and compelled to put into the little harbor of Saint Tropez, about thirty-seven miles from Toulon. Sultana, steam yacht, J. R. Drexel, has been laid up at Marseilles, Capt. J. R. Potter and First Officer A. I. Acorn returning to New York. Narada, steam yacht, Henry Walters, left Corfu on April 16 for Brindisi, when her owner and party were to leave her. On April 17 the British steam yacht Catania, under charter to Cornelius Vanderbilt, arrived at Nice from Genoa. On May 1 Varuna, steam yacht, Eugene Higgins, arrived at Venice from Trieste, and will lay up. The Enterprise, May and Barracouta are still in the West Indies.

As noted last week, the Port of New York is now under control of the War Department, and stringent regulations have been issued to govern all vessels entering or leaving, including yachts. The original order forbidding the passage through the Narrows or past Sandy Hook of any vessel after 7 P. M. or before 5 A. M. has been modified, the limits being extended to 8 P. M. and 4 A. M. The following notice was sent out last week:

"Tompkinsville, N. Y., April 27.—Notice is given by the Lighthouse Board that the Narrows, or southern entrance to New York Harbor, is closed to navigation by submarine mines, except through a safe channel marked by nun and can buoys, counted from seaward, painted white, and placed on the following bearings: First nun buoy, Fort Tompkins lighthouse, N.W. by W. $\frac{3}{8}$ W.; Robbins Reef lighthouse, N. $\frac{3}{4}$ W.; northwest part of Hoffman Island, S.W. $\frac{3}{8}$ S. First can buoy, Fort Tompkins lighthouse, N.W. by W. $\frac{1}{4}$ W.; Robbins Reef lighthouse, N. $\frac{1}{2}$ W.; south part of Fort Lafayette, N.E. $\frac{1}{4}$ N. Second nun buoy, Fort Tompkins lighthouse, W. $\frac{1}{2}$ N.; Robbins Reef lighthouse, N. $\frac{3}{4}$ W.; south part of Fort Lafayette, N.E. $\frac{5}{8}$ E. Second can buoy, Fort Tompkins lighthouse, W. $\frac{1}{4}$ S.; Robbins Reef lighthouse, N. $\frac{5}{8}$ W.; south part of Fort Lafayette, N.E. by E. $\frac{1}{4}$ E. In using the safe channel caution must be exercised. The nun-buoys must be left on the starboard hand by vessels entering and the can buoys on the port hand. When clear of the buoys danger is past, and regular courses must be resumed. Vessels bound out must follow the directions already published for passing through the main channel, New York Lower Bay."

On April 27 the lights on all the electric buoys in New York Harbor were extinguished, and on the following night the big lights on the Navesink Highlands were not lighted.

Notice has been given that the following named lights in the Lower Bay, New York, have been extinguished by order of the Lighthouse Board until further notice: Fort Tompkins light; Norton's Point (Coney Island) light, Romer Shoal beacon, Old Orchard Shoal light, Princess Bay light, Elm Tree and New Dorp, range for Swash Channel; North Hook beacon, Sandy Hook; South Hook beacon, Sandy Hook; Conover and Chapel Hill beacons, range for Main Channel; Point Comfort and Waackaack, range for Main Channel; electric lights, Gedney Channel,

Notice is given by the Lighthouse Board that at any time after May 1, 1898, the following light vessels may be taken from their stations without further notice: Nantucket Shoals light vessel, No. 66; Fire Island light vessel, No. 68; Northeast End light vessel, No. 44; Five Fathom Bank light vessel, No. 40; Fenwick Island Shoal light vessel, No. 45; Winter Quarter Shoal light vessel, No. 45; Cape Charles light vessel, No. 49; Diamond Shoal light vessel, No. 71; Frying Pan Shoals light vessel, No. 1.

Boston Harbor has been mined, leaving only a narrow channel for vessels of over 3 ft. draft, so that it is practically closed to yachts. The Delaware River has also been mined, resulting in similar conditions.

THE Geographical Society of Philadelphia has undertaken to put into practice the scheme of drift casks proposed by Com. Melville, U. S. N., for the observation of the circumpolar currents. These casks will be strongly built of wood, in shape a parabolic spindle, and will be set adrift beyond Bering Strait, in different localities. It is expected that many of them will be found at distant points after a few years of drifting.

The Spanish Yacht Catcher, Giralda.

THE well-known British steam yacht Giralda, Capt. H. C. McCalmont, the fastest yacht of her type afloat, has just been purchased by the Spanish Government, and it is stated that she will be used for the express purpose of chasing American steam yachts. The Giralda is described as follows by "Engineering:"

The yacht is remarkable in several respects, combining the principal features of a pleasure craft and an armed cruiser. The main engines are of the high-speed type, and it is interesting to note that not only has Mr. Laing designed, and the Fairfield Company constructed, the fastest merchant steamer, but also the fastest pleasure craft, for the Giralda on trial on the Clyde made 20.9 knots, the power developed being 8,500 indicated horsepower, with the engines running at 220 revolutions.

The propelling machinery consists of two sets of triple expansion engines, each set having four cylinders working on four cranks. Each set has one high-pressure cylinder 25 in. in diameter, one intermediate-pressure cylinder 40 in. in diameter, and two low-pressure cylinders 45 in. in diameter, all adapted for a stroke of 2 ft. 3 in. The high-pressure cylinders are each fitted with a piston valve, and the intermediate and low-pressure cylinders with a flat slide valve, all being worked by the ordinary double eccentric and link motion valve gear. The cylinder covers and pistons are of cast steel, made by Sir Joseph Whitworth & Co. The reversing gear is of the all-round type, with worm and wheel gear worked by a small steam engine.

The condensers are constructed of sheet brass, separate and distinct from the main engines, and placed in the wings of the ship. The condensing water is supplied by two large centrifugal engines with pumps of brass supplied by Messrs. W. H. Allen & Co., Bedford. The main and auxiliary feed pumps are separate and distinct from the main engines, and were supplied by Messrs. G. & J. Weir. Two fire and bilge engines are also fitted in the engine room, made by Messrs. Mumford, Colchester. A large evaporator for feed water make-up is fitted, and was supplied by Messrs. Caird & Rayner, London. The shaft for each engine consists of two pieces, each with two double-throw cranks, and, together with the tunnel shafting, is hollow, and all forged by Sir Joseph Whitworth & Co., Limited, of their fluid pressed steel. The propellers are fitted with blades of bronze. The crank and thrust shafts are 10.3-in. in diameter, and the propeller shaft 11 in., all with a 5 in. hole.

Steam is supplied by three double-ended and two single boilers made entirely of steel, having a total of sixteen ribbed furnaces, and constructed for a working pressure of 170 lbs. per square inch. They are 12 ft. 1 in. in diameter, the double-ended being 18 ft. 3 in. long and the single-ended 16 ft. They are adapted to work with moderate forced draft and closed stokeholds. The boilers are fitted in two separate boiler rooms, and arranged with one large funnel, air being supplied by ventilators for natural draft and fans for forced draft. The stokeholds are fitted with See's patent ejectors. The machinery and fittings are of light construction, steel and brass being largely used.

The dimensions of the Giralda are: Length on load waterline, 275 ft.; extreme width, 35 ft. 1 $\frac{1}{2}$ in.; and depth, 19 ft.; and 1,508 tons. Deck erections consist of a topgallant forecastle, large midship house 160 ft. long, and a small wheelhouse aft. In the midship house are situated the public rooms—the drawing and dining rooms at the after and the smoking room at the fore end—all communicating with each other by an inclosed passage running along the starboard side of the casings. The deck in these apartments and the corridor is entirely covered with oak parquetry, and the rooms are framed and paneled in solid hard wood, satin wood, oak, etc., varied in each apartment with furniture and upholstery to harmonize. The sleeping accommodation is all arranged on the lower deck, the height between decks being 9 ft. 6 in. Forward of the boiler space are four large cabins entering from the vestibule abaft the smoking room on the main deck, and abaft of engine space are the owner's cabin and another large stateroom. All these cabins are substantially framed in mahogany, with light silk in the panels. The framing has been enameled white throughout, thus giving the occupants all the advantage of the light which is here admitted by large sidelights, with stained glass lanterns on the inside, and also from skylights on the deck. Neat fireplaces, with white metal grates, have been fitted up in all the public rooms and in the principal staterooms, the other apartments being comfortably heated by means of steam apparatus. Two upright grand pianos have been supplied, one being placed in the drawing room and the other in the owner's stateroom, on the cabin sole, each with case made to harmonize with the surrounding frame. All the apartments are furnished and upholstered in elegant style, with brass or hardwood bedsteads, wardrobes, chests of drawers, writing tables, chairs, couches, etc.; the

floors covered with Axminster or Turkey carpets and rugs, silk curtains to windows and beds, and in fact everything which can be expected to assure the perfect enjoyment of a cruise.

There is a complete system of water-tight compartments, cutting off the engines from the boilers and dividing one set of boilers from another. Only in some bulkheads have doors been provided, and these can be closed from the main deck. The coal bunkers completely surround the boiler rooms, and the side bunkers are carried inward over the top of the boilers to the height of the upper deck, and along the whole length of the engine space. The side plating is 13-20 in., and 14-20 in. thick, and the bottom plating is mostly $\frac{1}{2}$ in. thick. The frames are formed of heavy channel bars, spaced 2 ft. apart, and the floors to every frame are $\frac{5}{8}$ in. thick. The bulkheads forming the water-tight compartments and the coal bunkers are all 16-20 in. in thickness. The vessel is built of steel throughout. Two Gardner guns and four Hotchkiss guns, with two electric searchlights of Admiralty pattern, add to the resemblance to an armed cruiser; and her crew of sixty Naval Reserve men, procured from the Orient service, with Mr. McCalmont himself as commander, with a master's certificate, encourage the idea that, although a private yacht, the Giralda may be regarded as at any time available as an Admiralty dispatch boat. She has a coal carrying capacity enabling her to make a voyage of over 3,500 nautical miles at a speed of fifteen knots; or of nearly 6,000 nautical miles at a speed of twelve knots. She is lightly rigged, with three pole masts and fore-and-aft sails with one yard on the foremast.

Baltimore Y. C.

THE Baltimore Y. C. is preparing for a very active season, with five different series of races. The dates are:

April 30, Curtis Bay course, McAllister cup.
May 7, Curtis Bay course, Rear Commodore cup.
May 14, Curtis Bay course, McAllister cup.
May 21, Curtis Bay course, Rear Commodore cup.
May 28, Curtis Bay course, McAllister cup.
June 4, Curtis Bay course, Rear Commodore cup.
June 11, Fort Carroll to lower channel buoy No. 1 and return to starting point, distance twenty-five miles, Vice-Commodore cup.
June 18, Curtis Bay course, McAllister cup.
June 25, Curtis Bay course, Rear Commodore cup.
July 4, notice to be given, Commodore cup.
July 9, Curtis Bay course, McAllister cup.
July 16, Curtis Bay course, Rear Commodore cup.
July 23, Curtis Bay course, McAllister cup.
July 30, Curtis Bay course, Rear Commodore cup.
Aug. 6, Curtis Bay course, McAllister cup.
Aug. 13, Curtis Bay course, Rear Commodore cup.
Aug. 20, Curtis Bay course, McAllister cup.
Aug. 27, mouth of Magothly River to Thomas Point light, to Love Point, to starting point, a distance of thirty miles, Withers cup.
Sept. 3, Curtis Bay course, Rear Commodore cup.
Sept. 10, Curtis Bay course, McAllister cup.
Sept. 17, Curtis Bay course, Rear Commodore cup.
All the races start at 3:30 P. M. except that of June 11, at 11 A. M., and that of Aug. 20, at 10:30 A. M.
The club's tender, the steamer Highland, will leave South street Saturdays at 12:30, 3:30 and 4 o'clock; Sundays at 10:30, 3 and 5, and on other days at 2 and 4 o'clock, making three return trips.

YACHTING NEWS NOTES.

The fifth annual volume of the Transactions of the Society of Naval Architects and Marine Engineers has been issued, under the editorship of the Secretary, Naval Constructor F. T. Bowles. It contains the papers read at the fifth annual meeting last November and noticed at the time. One of especial interest at present is on the subject of torpedo boat design, by Ass't Naval Constructor H. G. Gilmour. The volume, which is sent free to all members, is sold to subscribers at \$6, and to non-subscribers at \$10. The secretary has issued a small pamphlet containing a complete index to the five volumes thus far published, which will prove useful to those desiring to refer to the numerous valuable papers.

The Yachting Monthly Magazine for April, the third number, is quite up to the standard set by the preceding issues. The illustrations, both the special plates and the numerous small cuts, are very good indeed, and the reading matter is varied and interesting. The opening article, "The Story of My Life, by a 2 $\frac{1}{2}$ -Rater," written by Miss Barbara Hughes, is cleverly conceived and ably written. The technical articles include a very interesting account by Mr. Linton Hope of the construction of extremely light racing craft, such as his Lotus and Kismet; the writer tells very frankly those details of construction which are as a rule carefully concealed by designers. Mr. G. U. Laws contributes an article on the modern British canoe, which is very liberally illustrated. The quarterly designing competition instituted by The Yachtsman is producing excellent results, many very creditable designs being contributed. The winner of the last competition, for a fast cruiser of 48 ft. l.w.l., shows a handsome cutter of 67 ft. over all, 48 ft. l.w.l., 12 ft. 2 in. beam and 9 ft. draft, with 6 ft. 3 in. head room under the deck beams and a floor of 3 ft. 9 in. wide. The folding plates are a design for a sharpie 1-rater, by Capt. Marony, R. E.; the construction plan of Kismet, Mr. Linton Hope; prize design, fast cruiser, Mr. J. E. Odgers, and sharpie cruising canoe, Mr. G. U. Laws.

Nourmahal, steam yacht, J. J. Astor, has been approved by the Board of Auxiliary Cruisers, and Mr. Astor has notified the Government that he will sell her at such a price as may be deemed reasonable.

The trustees of the American Y. C. have tendered to the United States Government the use of their club grounds and house at Milton Point, on Long Island Sound, as a signal station. The annual fall regatta will be omitted this season.

The Chicago Y. C. will offer a cash prize of \$500 for a race to Mackinac on Aug. 6. The club will have its station at the Argo Club. The racing season will begin on June 9 with the first of three matches between Vanenna and Siren. The club will offer liberal prizes for the annual regatta. The following regatta committee has been appointed: J. O. Heyworth, A. C. Burton, C. E. Kremer, M. D. Wilber and S. N. Smith.

Zingara, sloop, formerly Gertrude, is at Poillon's yard, where a new and longer bow will be put on under the direction of Mr. A. Cary Smith.

Sagamore, steam yacht, has been chartered by Com. Morgan as the flagship of the New York Y. C. since the Corsair has been sold to the Government.

A. C. A. Membership.

APPLICATIONS for membership may be made to the purser of the division in which the applicant resides on blanks furnished by purser, the applicant becoming a member provided no objection be made within fourteen days after his name has been officially published in the FOREST AND STREAM.

Eastern Division.

Edward B. Carney, Lowell, Mass.
S. Colburn Clement, M.D., Pemigewasset C. C., Haverhill, Mass.

Canoeing.

American Canoe Association, 1897-98.

Commodore, F. L. Dunnell, Brooklyn, N. Y.
Sec'y-Treas., C. V. Schuyler, 309 Sixth avenue, Brooklyn, N. Y.
Librarian, W. P. Stephens, Bayonne, N. J.
PURSERS.
Atlantic Division, Wm. M. Carpenter, Main street, Sing Sing, N. Y.
Central Division, Laurence C. Woodworth, Gouverneur, N. Y.
Eastern Division, F. J. Burrage, West Newton, Mass.
Northern Division, Edgar C. Woolsey, 37 Charles street, Ottawa, Can.
Annual dues, \$1; initiation fee, \$1.

Western Canoe Association, 1895-96.

Commodore, C. F. Pennewell, Detroit, Mich.
Vice-Commodore, Nat. H. Cook, Chicago, Ill.
Rear-Commodore, E. H. Holmes, Milwaukee, Wis.

Executive Committee: R. M. Lamp, Madison, Wis.; C. J. Steadman, Cincinnati, O.; F. W. Dickens, Milwaukee, Wis.

Canoeing Contests at the Sportsmen's Show.

THE recent show of the New England Sportsmen's Association, which all the authorities agree was the finest thing of its kind that has ever been given in this country, has been faithfully described in all the publications, and a good idea of the realistic effects produced has been given to all those unable to visit the show through the fine pictures that appeared in the FOREST AND STREAM and other publications.

The series of canoeing contests that took place during the first week of the show were unique; many of them never having been seen before in this locality, especially the tugs-of-war in war canoes.

The miniature lake on which these events were pulled off was 60ft. long and 40ft. wide, with a uniform depth of 7ft. In order to enable the crews to face the audience of from six to eight thousand people that nightly gathered to witness the sports, the canoes were placed side by side in the tank about 15ft. apart, and connected by a rope running back to the end of the tank, through a pulley, along the end of the tank to a second pulley, and from there to the other boat. Thus when the strongest crew got ahead it pulled the other crew back a corresponding distance. The canoes for the club fours were in their turn attached to the same rigging.

Entries for the war canoe tug-of-war were received from the Taunton Boat Club, the Lawrence Canoe Club, Wawbewawa Canoe Association, of Newton, and Puritan Canoe Club, of Boston. In drawing for the matches the clubs were paired in the order given. The Wawbewawas and Puritans came together the first night of the show, the Wawbewawas winning in two straight heats both the war canoe and club four events. The first heat in war canoes was a comparatively easy victory, but in the second heat Capt. Dodge got his team together, and they put up a most determined fight, and it was only at the very end of the round that Capt. Drake's team got a lead of 2 or 3ft.

In the club fours the Puritans were pulled in the first heat and lost the second by their boat's swamping.

The second evening the "Pirates" of the Taunton Boat Club, under the command of Capt. Edward L. Sargent, met the team that Capt. Fred A. Wallace brought down from the Lawrence Canoe Club. This was the first appearance of the Taunton men in this vicinity, and the outcome of the match was watched with great interest by the local canoe men. The Taunton men were clearly outclassed by the Lawrence team in weight and watermanship, and although they put up a very plucky fight they lost both the war canoe and club fours to Capt. Wallace's team. This brought together for the finals the Wawbewawas and the Lawrence Canoe Club. This event was pulled off toward the end of the first week. Although the Wawbewawas were a lighter crew they proved themselves superior in watermanship and staying qualities, and the struggle in each heat was terrific. In the first heat, in spite of all they could do, Capt. Drake's team was pulled over 15ft., and it looked to the Wawbewawas' friends as if their goose was cooked. In the second heat Capt. Drake read the riot act to his men, and till within five seconds of when the whistle blew both canoes were exactly even, the crews pulling stroke for stroke. During this last five seconds the Wawbewawas wrung from their opponents an advantage of a half foot, which they held till the whistle blew. The excitement was intense, and every one of the vast audience was on his feet, when the men got into their boats for the final and deciding heat. At the word the crews took the water at exactly the same instant, pulling stroke for stroke, and the way they made the water boil in the lake can be better imagined than described. For over fifty seconds no advantage whatever for either crew was apparent; then the Wawbewawas began to gain an inch at a time, till they had a lead of little over a foot, which they held on to like grim death till twenty seconds over time, as the house was in such an uproar that it was impossible to hear the time-keeper's whistle, and neither team dared to stop. Both crews were badly punished, and the men all agreed that this was the hardest work they have ever undertaken.

The special match in club fours between the Wawbewawas and the Innitout Canoe Club, of Woburn, was won by the latter, the Wawbewawas being pulled in the first heat and their boat swamping in the second.

The prizes offered for the canoe upset brought Mr. W. T. Lawless, from Ottawa, Ont., the winner of the A. C. A. upset race at Grindstone Island last year. He gave a very clever exhibition of the act, first rolling his canoe completely over without taking in any water whatever, and vaulting back into it. He then entirely submerged the boat, shook the water out of it, and got back into it again, in ten seconds. It was unfortunate that Mr. Lawless' short stay in Boston prevented his meeting in this event Mr. Vincent J. Pelletier, of Montreal, who on the last night of the show did the "upset" against time, turning his canoe without taking in any water, and getting into it again in three and four-fifths seconds. The canoe used was a regulation open Peterboro weighing about 50lbs. It is a question if the un-

initiated audience fully appreciated the difficulties of this feat.

Among the other canoeing events that took place during the first week, the blindfold hand paddling race, in which the contestants paddled two lengths of the tank, turning a stake, was won by George R. Heckle, of the Wawbewawas. Probably no canoeing event created more amusement than the hurry-scurry race, in which W. T. Lawless, of the Ottawa Athletic Club; E. R. Adams, of the Wawbewawas, and G. B. Williams, of the Boston Athletic Association, came together for the finals. In this event the contestants ran the length of Exhibition Hall, dove over the rail into the lake, and swam to the other end, where they scrambled into their canoes, which they paddled back with their hands. The race between Lawless and Williams was very close, the former winning by less than a foot.

The interest of all the canoe men centered on the international tug-of-war, which took place on the last night of the show between the Wawbewawas, winners of the American Tournament, and a crew from the Lachine Boating and Canoeing Club, of Montreal.

The Lachine crew, which consisted of Capt. J. Hunter, President W. H. C. Mussen, H. B. Mussen, F. A. C. Bickerdike, R. Bickerdike, Jr., C. Baby, H. Baby, R. Howard, C. C. Smith, was a trifle lighter than the Wawbewawas' team of Capt. L. S. Drake, Wellington Wells (stroke), Ashenden, R. D. Smith, Brown, Colon, Wallace, Bowie, G. B. Smith. At the word the rapidity with which the Lachine men got away was an eye-opener to the Americans. They instantly secured a lead of several feet, which with their quick stroke they were unable to hold against the long, steady pull of the Wawbewawa paddlers, and when the whistle blew they found themselves beaten by about 3ft. The second round was very much the same except that the Lachine men lengthened their stroke, pulling almost stroke for stroke with the Wawbewas. And again the advantage they secured in the first half of the heat was overcome by the greater endurance and better watermanship of the Wawbewawas. Both heats were most gamely contested, and the Canadians won the admiration of the house, both on account of the determined fight which they made, giving the Wawbewawas a very close call, and the very sportsmanlike manner in which they accepted their defeat.

The result of these tugs-of-war demonstrated the fact that a long, steady stroke, with an almost instantaneous recovery, is the most effective for such work, the best paddle being the Canadian pattern with long narrow blade.

Rifle Range and Gallery.

Rest Shooting at 200yds.

WE are informed that recent tests of King's semi-smokeless powder, made by prominent riflemen in different sections of the country, have been most satisfactory, and certainly must be gratifying to the makers of this new compound. At the Greenville, N. J., rifle range, Mr. Wm. Hayes, the noted rifeman of Newark, N. J.,

Group of 20 shots, 200yds.

fired 30 consecutive shots from a rest at 200yds., using the FG. and CG. grain. The 20-shot group, consisting of two 10-group targets, given herewith, was made with the FG. grain, and the target made was pronounced by riflemen, who witnessed the test, as one of the most remarkable they had ever seen.

Rifle at Shell Mound.

SAN FRANCISCO, April 25.—The shooting conditions at Shell Mound yesterday were good. The regular semi-monthly shoot of the Columbia Pistol and Rifle Club for all-comers' medals was held. Good scoring was done by F. O. Young with a Sharps military rifle. He made two scores of 49, Creedmoor, each. A. H. Pape made two of 48 each. Other scores were:

Siebe pistol medal, 50yds., Columbia target, 10-shot scores: F. O. Young, 55, 56, 63; J. P. Cosgrove, 67.
Colt's Bisley trophy, 10 shots: J. E. Gorman, 59, 43, 48, 49, 51, 51, 54, 53, 55, 58, 57, 59, 61; F. O. Young, 54, 58, 64, 70; A. H. Pape, 85.
22-rifle medal, 50yds., for ladies: F. E. Mason, 18, 21, 25, 25; Mrs. M. J. White, 42.

All-comers' rifle medal: D. W. McLaughlin, 51, 54.
The monthly medal shoot of the Red Men's Schuetzen company resulted as follows:

First class: M. Deckert 327. Second class: J. A. Mohr 265. Third Class: George Heuer 230. Fourth class: Capt. Grieb 263. First best shot: M. Dieckert, 20; last best shot, J. A. Mohr, 21. Championship class did not fill.

Many members of the San Francisco Schuetzen Verein participated in the monthly bullseye shoot. The winning scores, in their regular order, follow:

L. Bendel, 244, first; George A. Schultz, 355, second; L. Haake, 420; F. Koch, 476; A. Bertelsen, 489; F. P. Schuster, 560; William Ehrenpfort, 731; John Utschig, 759; C. F. Rust, 760; R. Stettin, 777; Fred Brandt, 834; A. Browning, 905; John Woebecke, 924; H. Heilberg, 949; D. B. Faktor, 1002; J. C. Waller, 1036; A. H. Pape, 1081; H. Huber, 1082; H. Stelling, 1088; D. Dunker, 1115; ROEEL.

Louisville Revolver Club.

LOUISVILLE, Ky., April 26.—The Louisville, Ky., Revolver Club held its last shoot at the Armory April 26. A good attendance was present to witness the contests, which only five of the members took part in. Visitors are always welcome to attend the shoots, and seem to enjoy them, as each meeting brings new faces with it. The local club will lose several crack shots when the First Regiment is called to the front next week, as Lieutenants W. J. James and Lon Ross, of Company A, are active members of the revolver

club, and will be missed in the coming match with the Brooklyn Club, as both of them are fine shots. Other members will go as privates. There is some talk of a possible postponement of the match, as the war will not leave a team sufficiently strong to win from the Eastern cracks. It may be that several new members can be trained enough to take the places of those of our best shots, who were among the very first to volunteer their services to our country.

At the regular meeting held on April 20, F. M. Taylor made a very remarkable score of 98 out of a possible 100 in the 15yd. distance, lowering the club record for that distance. A time limit of twenty seconds is allowed for 5 shots at a 4in. bullseye. Mr. Taylor made the 10 shots in thirty-one seconds, using a single-action S. & W. .38cal. 6in. barrel revolver, strictly open sights and U. M. C. cartridges.

Lieut. Shaw, of the Legion, left several weeks ago for the Klondyke. If he were now at home it would give him an opportunity of seeking honor instead of wealth.

We give the scores of last shoot in full:

Ten yards, 2in. bullseye counts 10:
H S Gilbert 9 10 10 10 10 10 8 10 10 10—97
E B Dye 10 10 10 10 10 10 9 8 9 8—94
F M Taylor 3 5 8 9 10 10 8 6 7 8—71
M Board 1 10 2 1 3 6 4 10 7 8—52

Fifteen yards, 4in. bullseye counts 10, twenty seconds for 5 shots:
Lieut W J James.....10 10 10 10 9 10 9 8 7 7—90
E B Dye 3 6 9 7 7 6 9 10 3 8—73
H S Gilbert 10 8 8 6 5 10 10 9 8 4—73
F M Taylor 9 9 7 7 6 9 8 8 7 2—72

Twenty yards, 2in. bullseye counts 10:
H S Gilbert 9 8 9 10 5 9 9 7 10 8—86
E B Dye 3 6 9 7 7 6 9 10 3 8—68
M Board 10 4 7 2 6 6 9 9 2 7—62
F M Talyor 5 4 3 5 3 1 8 4 8 9—50

Thirty yards, 4in. bullseye counts 10:
E B Dye 10 10 10 9 9 9 10 10 9 8 8—92
H S Gilbert 8 10 9 10 10 10 9 9 9 7—91
F M Taylor 2 2 6 10 7 7 7 6 4—58
E. B. Dye.

Trap-Shooting.

If you want your shoot to be announced here send in notice like the following:

Fixtures.

May 4-5.—Brunswick, Ga.—Tournament of the Interstate Association, under the auspices of the Atlantic Gun Club. J. H. Polhill, Sec'y.

May 4-6.—Newburgh, N. Y.—Trophy shoot, Hudson River Trap-Shooters' League, on grounds of Newburgh Gun and Rifle Club. J. B. Rogers, Manager.

May 4-6.—Eau Claire, Wis.—Tournament of the Eau Claire Gun Club. E. M. Fish, Sec'y.

May 7.—New Haven, Conn.—Intercollegiate Shooting Association's first shoot, on the grounds of the New Haven Gun Club.

May 10-11.—St. Cloud, Minn.—St. Cloud Gun Club's amateur tournament. E. S. Hill, Sec'y.

May 10-13.—Des Moines, Ia.—Charley Budd's shoot. First three days, targets; \$350 added. Fourth day, live birds; 25 birds, \$25, handicap, \$50 added.

May 16-21.—Kansas City, Mo.—Annual tournament Missouri State Fish and Game Protective Association. G. M. Walden, Pres., Kansas City.

May 17.—New Haven, Conn.—First tournament of Connecticut State League, on New Haven Gun Club grounds.

May 17-19.—Macon, Miss.—Tenth annual shooting tournament of the Noxubee Gun Club. C. M. Scales, Manager.

May 18-19.—Crawfordsville, Ind.—Tournament of the Crawfordsville Gun Club. C. E. Lacy, Sec'y.

May 20-22.—Butte, Mont.—Montana State Sportsmen's Association's tournament, on grounds of Butte Gun Club. Birds and targets; \$500 added money. C. M. Smith, Sec'y.

May 24-27.—Omaha, Neb.—Twenty-second annual tournament of the Nebraska State Sportsmen's Association. F. S. Parmelee, Sec'y.

May 25-27.—Owego, N. Y.—Owego Gun Club's tournament. Two days at targets, third day at live birds. Frank B. Tracy, Sec'y.

May 30.—Canajoharie, N. Y.—Decoration Day shoot of the Canajoharie Gun Club. Targets. Charles Weeks, Sec'y.

May 30.—Newburgh, N. Y.—Glenmore Rod and Gun Club's holiday shoot.

May 31-June 2.—Circleville, O.—Pickaway Rod and Gun Club's tournament. G. R. Haswell, Sec'y.

June 1-2.—Peekskill, N. Y.—Trophy shoot, Hudson River Trap-Shooters' League, on the grounds of Peekskill Gun Club. J. B. Rogers, Manager.

June 1-3.—Springfield, O.—Open-to-all tournament of Ohio Trap-Shooters' League.

June 2-3.—Alton, Ill.—Second annual bluerock tournament of Piasa Gun Club. F. C. Riehl, Sec'y.

June 7-8.—Ottawa, Kans.—Annual tournament of the Kansas State Sportsmen's Association. W. L. Beardsley, Sec'y-Treas.

June 7-8.—Indianapolis, Ind.—Annual tournament of the Indiana Trap-Shooters' League, of Indiana, on the grounds of the Limited Gun Club.

June 7-11.—Peoria, Ill.—Annual tournament and convention of Illinois State Sportsmen's Association.

June 8-9.—Findlay, O.—Annual tournament of the Magatrap Gun Club. O. B. Marvin, Sec'y.

June 8-10.—Parkersburg, W. Va.—Second annual tournament of the West Virginia State Sportsmen's Association. Address all communications to Ed O. Bower, Sec'y, Sistersville, W. Va.

June 14-15.—Stillwater, Minn.—Tournament of the Stillwater Gun Club.

June 14-15.—Grafton, N. D.—Tournament and meeting of North Dakota S. S. Association.

DRIVERS AND TWISTERS.

We would suggest to Parker Brothers that it would be better to send one of their popular representatives to the far North, away from the sniff of battle smoke. Good soldiers are fairly plentiful, but able and popular experts are not to be had for the asking. We do not care to mention any names in the matter. The following is a clipping from a New Orleans paper: "At the Cosmopolitan is Arthur du Bray, of New York, and the representative of a prominent gun factory. Mr. Du Bray is a globe trotter, and speaks several languages most fluently. Furthermore, he is an ex-United States regular, having served for fifteen years in the army. He was a member of Custer's command, and fortunately for him was stationed in Fort Suet when Custer left on his last fight. His reminiscences of his campaign were delightful. 'You know,' he said, 'it makes me feel so blue to see all these strapping fellows, with their blue shirts and campaign hats, walking around. I wish I was once more among them, one of them, and that I would go to Cuba to fight, not only for the Cubans, but also to avenge the dastardly destruction of the Maine. I don't think that Spain will fight, for she is going into the fight a whipped belligerent, and she knows that no European nation will aid her, for they have too much at home to look after.'"

The fame and usefulness of the Winchester repeating shotgun are increasing. The Winchester Company now announces that it has prepared and can furnish a "take down repeating shotgun of the model of 1897, which can be taken apart and put together as easily and quickly as a double shotgun, and so can be carried in an ordinary hand gun case, a trunk or rolled up in one's bed. When taken apart, the stock and action remain in one piece, barrel, magazine and forearm in another, so that there are no small pieces to be lost. This 'take down shotgun' can be fitted with interchangeable barrels of different lengths and styles of bore."

A feature of the Brooklyn Gun Club's shoot last Saturday was several extra events at one-cent targets, a departure from the usual custom at shoots. The regular price was two cents. Any reduction in the expense of shooting adds correspondingly to its popularity. It is an easy matter to shoot at 200 targets in an afternoon. At two cents each, there is an expense of \$4. The necessary ammunition adds to this \$4 or \$5 more. Railroad fare adds still another item. We will have more to say on this subject in the near future.

The shoot of the Warwick Gun Club will not take place on May 11 and 12, as originally fixed, it having been postponed till some time in August.

A fortune awaits the man who can discover a remedy for "finching" or "fudging," as the sudden shrinking at the moment of firing is called, and which results in either a wild shot or a most ridiculous failure to shoot at all. A peculiar feature of the matter is that the victim does not know the cause of it. He cannot tell whether the failing is mental or physical, subjective or objective. At the moment of pulling the trigger there is a nervous flinching, although the shooter stands at the score with his usual confidence. The advice offered as cures for the evil, by men who are wise in the matter, is as follows: To lengthen the stock, to shorten the stock; to hold the gun harder against the shoulder, to hold the gun lightly against the shoulder; to use lighter loads of powder, and so on, ad infinitum. If there is any good Samaritan who knows how to cure the evil of flinching, he would confer a great boon on many shooters about New York and elsewhere if he would make his panacea known.

The first tournament of the Connecticut State League will be held on the New Haven Gun Club's grounds, near Schuetzen Park, May 17. Shooting commences at 9:30. All shooters are cordially invited. There are twelve events, of which eight are at 10 targets, unknown and reversed angles. Two of these are 50 cents entrance, the remainder at 75 cents. There are four 15-target events, two at \$1, two at \$1.25 entrance. Targets, 2 cents, included in all entries. All moneys divided 40, 30, 20 and 10. Electric cars from Cedar Hill Station and Union Depot to club grounds. Visitors welcome to shoot for targets only. A team race, composed of members representing clubs of the league, will begin at 2 o'clock.

On Thursday of this week the Catchpole Gun Club, Wolcott, N. Y., will give a bluerock tournament shoot, to begin at 10 o'clock A. M. The Jack Rabbit system will govern. Events 1, 3, 5, 7, 9, 11 and 13 are at 10 targets, 50 cents, surplus money divided 50, 30 and 20 per cent. Events 2, 4, 6, 8, 10, 12 and 14 are at 15 targets, 75 cents, surplus divided 40, 30, 20 and 10 per cent. Targets extra at 1½ cents. Uncle Ben Catchpole, president; E. A. Wadsworth, secretary.

The friends of Mr. George Work will rejoice to know of his rapid recovery from the effects of a surgical operation for appendicitis, performed on him about three weeks ago. While on a visit to Arizona an acute attack of the disease hastened his return to New York, where he was placed under the care of several skillful physicians and surgeons, with the happy result above mentioned.

The Valley City Gun Club, of Grand Rapids, Mich., has arranged a novice class for its less skillful members. The latter can shoot from 1 to 3 o'clock in the afternoon at the expert traps. At 3 o'clock the regular programme begins at the Maga- trap. Members are classified in the trophy and medal events as seniors and juniors, according to their known records.

Four birds between the winners and the losers in the champion contests seems to be a standard number at present. Parmelee beat Brewer by a score of 94 to 90. Next Gilbert defeated Parmelee by a score of 86 to 82. And now comes forth Jim Elliott with a score of 90 to Gilbert's 86. The ancient odd number, 13, is likely to lose its job if this 4 holds its career a while longer.

The Lincoln Gun Club, of Alameda, Cal., introduced a novel event at its shoot on April 17. It was called "the coursing match." The names of the contestants were drawn from a hat in pairs. The pairs shot against each other, the winners going into the second round, and so on, round after round, till there was but one left, after the manner of a coursing match.

The race between Messrs. Paterson and Cunyngham, of Chicago, for the Chicago challenge trophy, April 29, resulted in a tie. The plunger of Cunyngham's gun broke. A consequent change of gun resulted in a loss of the remaining two birds, the 24th and 25th. Each scored 20. The match will be shot again on Friday of this week.

Mr. C. M. Hobart, secretary of the Hobart Gun Club, Hobart, Ind., writes us as follows: The Hobart Gun Club will hold an all-day amateur tournament on Tuesday, May, 24. Maga- trap and bluerocks will be used. Thirty to forty shooters are expected to be present. Programmes ready May 15.

This week, Wednesday, the gold watch handicap of the Boiling Springs Gun Club, Rutherford, N. J., takes place. Conditions, 50 targets, \$1 entrance. Next week, Wednesday, at the same place the E. C. cup handicap will take place, at 15 singles and 5 pairs, entrance 50 cents.

Next week, May 10 to 13, inclusive, Charley Budd's shoot will take place at Des Moines, Ia. First three days, targets, \$350 added; fourth day, live birds, 25 birds, \$25, handicap, \$50 added. May 10 and 11, the St. Cloud Gun Club, St. Cloud, Minn., holds its first amateur tournament.

The blithesome zephyrs of the past month blew some frazzles on many things, but none more than on the general averages of trap-shooters. From north and south, east and west, come reports of low scores caused by the March winds.

The Boiling Springs Gun Club, Rutherford, N. J., announces the second and fourth Wednesdays of each month, commencing in May, for the E. C. cup handicap, at 15 singles, 5 pairs; entrance price of targets.

The Bergen County Gun Club, Hackensack, N. J., will hold a cup shoot Saturday of this week, the event being at 25 targets, \$1 entrance. The cup is the property of the winner. Shooters are invited to participate.

Mr. Frank B. Tracy, secretary of the Owego Gun Club, Owego, N. Y., desires that we publish that professionals and experts are barred, but that the club expects to give each day a sweep for them.

As will be seen by referring to Mr. T. H. Keller's communication in this issue, there is a call for a meeting of the New Jersey State Sportsmen's Association on June 2, at 2 o'clock P. M., at 377 Broadway, New York.

The Hempstead Rod and Gun Club held an opening of its new club house, April 30. It is situated north of the Hempstead Bay Y. C., on Great South Bay.

The Troisdorf cup event, in our report of the Brooklyn Gun Club's shoot last week, was mistakenly set up as the Troisdorf gun event.

Trap Around Reading.

READING, Pa., April 30.—The Highland Rod and Gun Club, of this city, held their monthly club shoot at their grounds, "Never-sink Flats" to-day, each man shooting at 25 targets in the medal shoot. Mr. Geo. W. Lindomuth officiated as referee. The score of the club shoot resulted: Bohn 17, Merkel 19, Grund 16, Knechel 15.

Pottstown, Pa., April 30.—The Shuler Shooting Association held a practice shoot to-day, in preparation for the first of the series of three shoots with the Penn Gun Club, of Norristown, on May 7. A high wind interfered, which kept the scores low. Sweeps were shot in all events. The scores follow:

Events:	1	2	3	4	5	6	7	8	9	10	11
Targets:	10	25	7	7	7	7	7	10	*	*	*
Grubb	5	17	3	5	4	7	4	7	7	2	5
Saylor	5	14	5	4	5	3	7	7	0	1	
Miller	5	15	2	6	3	2					
Smith	5	14	2	4	7	5	5	2	6	0	2
Prego	5	13

* Miss-and-out.
Norristown, Pa., April 30.—The Penn Gun Club, of this place, defeated the Social Gun Club, also of this borough, in a bluerock target match to-day by the score of 141 to 134. There were teams of 10 men, and each man shooting at 25 targets.

Philadelphia, Pa., April 30.—The following scores are the scores for the Wayne Gun Club's handicap monthly shoot. Sweeps followed.

Dillon, 11	29	Call, 26	18
Loistman, 22	27	Morison, 5	17
Daly, 5	25	Engle, scratch	17
Morris, 16	23	Morgan, 5	16
McMichael, 1	18	Rockefeller, 16	15
McConnell, scratch	18	Forest, 1	15
Bender, 1	18	Van Nort, scratch	14
Riotte, 9	18	Dr Hancock, scratch	14

ON LONG ISLAND.

BROOKLYN GUN CLUB.

April 29.—The all-day invitation shoot of the Brooklyn Gun Club, held to-day, was a pronounced success. John Wright, the manager, exerted himself to make the day a pleasant one for the club's guests. In the merchandise events, the poorer shooters received handicap allowances, which gave them a chance against the more expert shots, and the sweepstake events had three and four moneys, so that while none won anything more than would go on expense account, no one lost enough to be of any importance.

The day was cloudy and the light dull, though the absence of wind was favorable to the shooters. Manager Wright had arranged the maga- trap so it threw the targets higher, and full scores were by no means an easy matter to make.

There was a good attendance of amateur shooters, as the scores below will show.

Nos. 1 and 2 were at 10 targets, 50 cents. Nos. 3 and 5 were at 15 targets, 75 cents. Nos. 6 and 9 were 15 targets, \$1.

After the ten regular events had been shot through, Manager Wright announced that the extra events would be shot at the pleasure of the shooters, the targets being thrown for one cent each. Five extra events were shot off. No. 15 was at 10 pairs. Banks and Jennings shooting against Money and Beveridge, the two latter winning by a score of 30 to 25.

Mr. John Regan, of Brooklyn, attended to the cashier's department in his usual masterly manner. The scores:

Events:	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15

* Pairs.

NEW UTRECHT GUN CLUB.

Woodlawn, April 30.—The bi-monthly clay-bird shoot of the New Utrecht Gun Club was held at Woodlawn to-day. With one exception, that being the high wind, we could not ask for a more perfect day for target shooting. The club medal and the Troisdorf cup were very closely contested, P. E. George's shooting being of the gilt-edged order. He won both the club shoot and the powder cup. This makes his second win, and the way he is shooting now, it looks like a walkover for him. Live-bird shooting next week. Friends, come down and visit us!

The scores in the club shoot at 25 targets were as follows:
P. E. George 001101101101101110111111-23
T. B. Ryder 10111101100111110010111011-22
P. A. Hegeman 01001111011011011101101111-22
S. B. Topfitz 011101110011111100000111111-21
W. H. Thompson 11100110111111101010101011-20
D. C. Bennett 1100111101101111111100011-20
H. L. Hayden 100100100110110111111101011-18

IN NEW JERSEY.

BOILING SPRINGS GUN CLUB.

Rutherford, N. J., April 27.—A stiff wind blew from the left quarter toward the shooters, or what riflemen would call a 9 o'clock wind. It gradually increased in strength, so that in the last three or four events it tossed the targets up and down, and in puzzling sidewise curves, which required great skill to negotiate. The targets were thrown very swiftly, making hard shooting, so that the best scores are exceptionally good under the circumstances.

In event No. 7, the traps were at the highest tension, throwing at sharp quartering angles, making the hardest kind of shooting.

Nos. 1 and 2 were expert rules. In No. 4 Morley won second in round 2, miss-and-out. In No. 6 Banks won first in round 11, miss-and-out. No. 8 was a match between Capt. Money and Morley. Nos. 9 and 10 were at 20yds., use of both barrels. The wind in the latter events was blowing hard. Left-quartering birds would rise high in the air, slow up, rest a moment or two in the air, then descend before the strong wind at lightning speed. In the last events Banks broke one far out and high up to the left with a second shot from his Winchester, about two-thirds of the target remaining whole. The wind brought it around in a curve and it started from its great height with quickly accelerated velocity, passing back of the three shooters, who did not see it, missing Banks' head by a few feet

WESTERN TRAPS.

BINGHAM-STANNARD.

CHICAGO, Ill., April 26.—The match to-day between Eddie Bingham and W. D. Stannard for the E. C. cup, the Cook County League trophy, was a walk-over for Bingham, who beat his rival 16 birds. The wind made the targets erratic, and the conditions were not easy, as may be seen: 100 targets, 20 singles, known angles and traps, 25 expert rules, 25 reverse pull, 15 pairs. Score: Stannard11111011010110011111—15

ELLIOTT-GILBERT.

The race between J. A. R. Elliott and Fred Gilbert for the Star cup to-day was interesting and somewhat surprising. Gilbert, holder of the cup, was considered safe winner, especially since his remarkable race with Parmelee, one of the best scores he ever shot. To-day, under conditions at least 10 birds to the 100 easier, he only duplicated his score of 86, and showed some very ragged work indeed. His score of 16 birds out of 25 in the second quarter of the race is the lowest that Fred has shot for many a day, nor is he likely to go so low again very soon. He caught several very fast low birds which went off to the right at such a gait that he seemed not to find them at all. In the second half of the race he stiffened up and closed the gap, but could not overcome the remarkable lead of 7 birds which he had allowed his opponent to gain.

Elliott on the other hand shot in slashing style. Of course he missed his first bird, as he usually does, and he was one behind at the end of his first 25. He was grinning and happy on the 50 turn, and then began to be so confident that he was a little careless at times. He came back to Fred so rapidly that there were only two birds between them. However, he forged ahead a couple more before the end of the race. Elliott's high run was 33 birds, and Gilbert's high run 21 birds. Gilbert led up to the 28th bird, where Elliott said good-by to him. At the 36th bird Elliott was 4 ahead. At the 50th he was 7 birds ahead. At the 69th he was only 2 ahead, and was showing some work so careless that many thought Gilbert would yet win. The latter, however, was a beaten man and could not close the 2-bird gap. Elliott should have scored 3 more birds than he did, being too careless with his work, as when he allowed a flagged bird to jump up and come directly at him, but get away unhurt.

The weather was perfect for the Kansas City man, being bright, clear and warm. The wind was fresh and brisk, and it was a good shooting day. The wind came quartering from the score in the direction of a right quartering driver. There was some talk that Elliott was luckier in the birds. He may have been in his second 25, but the luck of the birds runs about even in the 100 on the Watson grounds. The referee was of course John Winchester. The park dogs did the retrieving. Elliott shot his Winchester repeater, 42gr. of Hazard powder and 14oz. of 7s in Leader shells. Gilbert used his L. C. Smith gun, 3½drs. of Du Pont powder and 14oz. of 7s in Leader shells.

Among the spectators at the race were Jimmie Whitfield, of the Kansas City Star; Dr. Whittier, of Kansas City; Bee, of Nebraska; Dick Merrill, Ed Silverman, E. E. Rogers and G. L. Deites, of Milwaukee; Elmer Neal, of Bloomington, Ind.; and J. J. Hallowell, Jr., of the U. M. C. Co. All these took interest in watching the latest race among the cracks. At the close of the race Elliott announced that he would give any one the chance for this cup between now and the Kansas City tournament. If the four men eligible to shoot in the final race for this trophy would put in \$100 apiece and shoot at 100 birds, they would have a sportier event than can be possible in a 25-bird race. Jimmie Whitfield, of the paper presenting this cup, tells me that he has had some fine large-sized photographs made of it, and will give one to each contestant for the cup.

In the order of the birds to each Gilbert killed straight to his 8th, which was not injured. His 20th halted at the trap, but then sprang high and got away. His 28th was low and fast and was unhurt. He shot to the left of his 29th with his second barrel. He overshot his 31st. His 32d was low and fast, and fell against the wire in its effort to get over. His 33d was high and fast, and got away. His 36th was similar, and was hit very light with the first barrel. His 41st was a fast bird, and was hit hard, but escaped. His 44th was low and swift, and was apparently not touched. His 45th wobbled over the wire. His 48th was missed clean. His 56th was killed at least 48yds. from the score, and his 57th was another lucky long kill. Good work with the dog stopped his 64th bird. His 65th was flagged. His 70th wobbled across the wire. His 84th was one of his low hoodoo birds, and he could not stop it. His 87th was a good kill on a fast one. His 89th he missed clean with his first barrel, but stopped it with his second at long range. Another long second on his 91st brought applause, and again on his 93d he used a good second. His 98th bird was apparently not touched.

Elliott's 1st bird was knocked down inside the wire, but the dog could not gather it. His 9th was high and fast, and twisted out of both loads, and the same should be said of his 11th. His 25th and 32d birds were starting long kills. He then settled down and did steady and clever work for his long run. He undershot his 51st bird, which was very high and fast, and he could not score his 55th, although it was jarred heavily. His 59th was a careless snap shot. His 65th struck the wire, but fell across and could not be scored. Luck, however, evened up, for his 68th bird wobbled up against the wire and fell dead inside. His 69th was a piece of careless work, but his 70th brought out applause, when he stopped a screecher with his second apparently at 50yds. His 68th bird hit the wire. His 76th was killed on top of No. 5 trap, but was so swift a flyer as to bring applause. On his 78th and 82d birds he did fine second barrel work, and on his 86th he caught one of Gilbert's hoodoos, a low and fast driver, which, however, he killed. He finished strong with 24 out of his last 25, and won very cleverly. Score:

HALLOWELL-DICKS.

After the Elliott-Gilbert race, "U. M. C." Hallowell cast his roving eye about for some easy money, and finally got on a race with B. Dicks, a Chicago heavy-weight. They only shot at 10 birds, as Mr. Dicks said he could not afford to pay for any more than that. Instead he did not have to pay for any. Score: J J Hallowell, Jr.....2100122212—8
B Dicks.....2222201222—9

PATERSON-CUNNYNGHAM FOR THE CHICAGO TROPHY.

April 29.—The trustees of the Chicago challenge trophy met earlier in the week to decide which one of the challenges for that trophy Mr. Paterson should accept. The decision was that Mr. V. L. Cunyngnam's challenge should hold. To avoid future complications the trustees decided to require that all future challenges for the trophy shall be made direct to the chairman of the Board of Trustees, W. P. Mussey, 106 Madison street, and shall be in writing, accompanied by the necessary forfeit money, which is only the cost of the birds. The first challenge received complying with the above conditions will be the one considered. Mr. Paterson and Mr. Cunyngnam shot their race at Wat-

son's at 2 o'clock to-day. Paterson was, under the handicap, placed at 20yds., and shot at 25 birds. Cunyngnam was placed at 29yds. and given 26 birds. The latter, however, forgot to avail himself of his advantage in distance for more than three or four birds in the race, shooting for the most part at 30yds.

This little race afforded a good deal of fun for the spectators. The weather was perfect, bright and clear, with a light wind. The birds turned out unexpectedly fast, and both men made some grand stand stops of a most sensational character.

Cunyngnam is about one-quarter as big as Patti, and is snappy and positive in action. He fell down on his 6th bird, which was not caught with the second. On his 8th bird he actually shot ahead of the bird, which started slow, whereas the others had been fast. His 11th was fast and high, and was not hit. His 13th was a screaming stop, and his 15th and 19th were also deep field kills on very fast birds. His 21st fell in bounds, but the dog could not gather it. His 22d was a sensational kill. On his 24th bird Cunyngnam had hard luck, which possibly lost him the race. His second barrel failed to explode the shell, and it was found that the plunger was broken. He borrowed Mr. Paterson's gun, which did not fit him, and missed the next bird with his one remaining barrel. He managed to kill his next two birds with Mr. Paterson's gun, and so tied the score.

Mr. Paterson shot behind his second bird with his first barrel, and could not stop it inside the wire. His 6th bird sprang very high and was undershot. His 8th was killed with as fine a shot as ever was seen on John Watson's grounds. His 9th was shot too far back and wobbled over, and his 10th repeated the same performance, though hit very hard with both barrels. On his 11th he was slow getting on, but he stopped the bird at extraordinary range. On his 14th he flinched about 4ft. away from the bird, but killed it with his 2d. On his 21st he got a lucky wing with his second. His 22d was hard hit, but got away, and his 23d, equally high and hard, was only stopped with a fine second barrel. His 25th was flagged and proved an easy kill. On counting up the stings it was found that the men were tied on 20 each. After some talk they decided to shoot off the tie one week from to-day. In the race to-day Mr. Cunyngnam shot a Westley Richards gun, 3½drs. of Schultze powder 1¼ oz. 7s in Smokeless cases. Mr. Paterson shot a Remington gun, 3½drs. of Du Pont powder, 1¼oz. 7s in Leader shells. Scores:

ELGIN GOLD DUST SHOOT.

Under date of April 23 Mr. C. E. Middleton, of the Elgin, Ill., Gun Club, writes:

"I inclose scores of the Gold Dust Smokeless Cup Shoot. The attendance was not so large as expected, considering the race is for a very nice silver cup, open to seven counties, but the weather was bad. It looked like rain in the morning. We anticipate a good attendance at our next shoot, May 28. Shooter is allowed to shoot up one back score. All seemed to enjoy themselves in spite of the day. Following are the scores shot:

Gold Dust Cup Shoot, at 20 targets: E. E. Neal 18, Barto 16, L. H. Owen 19, J. Rubie 17, H. Dunnell 14, Boa 14, Graham 15, Nish 11, W. Hawthorn 11, Eby 12, McGough 12, Bennett 12, Pitson 16, Grunaw 12, Andrews 12, Middleton 14, Freeman 15, Adams 14, Sowers 9, R. Hawthorn 8, Weatherill 6, Cheeseman 16. L. H. Owen, of McHenry, Ill., won.

CENTRAL OF DULUTH.

Central Gun Club, of Duluth, Minn., had a good turnout at the club shoot last Saturday, Nelson carrying off most of the honors, winning the 25-bird event and scoring 85 out of 105. All the races were at 10 singles, except the last, at 5 pairs, and the next to the last, at 25 singles. Scores:

CENTRAL OF ST. LOUIS.

The opening shoot of the St. Louis Central Gun Club was held Sunday, May 1, at their grounds, foot of Meramec street, and thereafter the regular shoots will be held on the following dates: May 15 and 29; June 12 and 26; July 10 and 24; Aug. 7 and 21, and Sept. 4. All birds thrown from a magautrap.

K. C., OF K. C.

Kansas City Gun Club, of Kansas City, Mo., at the last monthly medal shoot found J. B. Porter to be their best man, he scoring 24 out of 25 live birds.

The team chosen to represent this club in the team championship race at the State shoot, May 16-21, will be J. B. Porter, R. Jarrett, J. M. Curtis and J. H. Hubbard.

PEORIA-PEKIN.

Twelve men from Pekin Gun Club, of Illinois, on April 24, met a similar number from Peoria, who came over to Pekin to engage in a little team race, 25 targets per man. The home talent won, the score being Pekin 223, Peoria 221. There will be a return match, as the Peoria men think that 2 birds does not mean a decisive difference of skill.

PERUVIAN BARK.

The Peru Gun Club, of Indiana, opened its second State amateur tournament April 27, with about sixty entries. J. A. Ruble of Chicago, made the best average of the day. E. Apperson, of Kokomo, was also among the high guns. Under Jack Parker's management, everything went very smoothly, and nearly 10,000 targets were thrown. The tournament closed April 28, and the high averages were as follows: F. D. Alkire, Woodyin, O.; F. N. Snow, Brooklyn, O.; John Ruble, Chicago; Ralph Valentine, Monroeville, O. Snow made a 25 straight run the last day. O. P. Garland made four straights, and a squad of five killed 74 out of 75. The State Trap-Shooters' League decided to hold the championship contest at Indianapolis June 8 and 9.

WATERLOO SHOOT.

The eighth annual tournament of the Waterloo Gun Club, of Iowa, began April 28, with unfavorable weather. Among the outsiders present were C. P. Cook, H. P. Densel, G. H. Gish, W. B. Kibbey, J. D. Kibbey, L. C. Abbott, Marshalltown; G. H. Remington, Montour; G. L. Taylor, Algona; Mortenson, Britt; Lynberger, Clarion; Hagerman, Durkee and Sherwood, Independence; Erbe, Dr. Glazier, Al Pettit, Osage; Dr. Duluth; R. E. Smith, Mason City; Bain, Glover, Brandon; Mealey, Oelwein.

The intercity shoot for the State trophy began in the afternoon with the following teams: Marshalltown—W. B. Kibbey, C. P. Cook, H. P. Densel, L. C. Abbott, G. L. Taylor.

Waterloo—Gus Place, Henry Steege, L. Van Vleck, Fred Ward, W. N. Birdsall, J. C. Hartman,

JUNCTION CITY SHOOT.

Jack Fanning had it pretty much his own way on the first day of the annual shoot at Junction City, Kans., easily going high gun.

WICHITA SHOOT.

The tournament of the Central Kansas Association at Wichita was a success, the entry going to thirty-nine in three of the events. Kansas seems to be taking great interest in trap this season.

E. HOUGH.

1206 BOYCE BUILDING, Chicago.

Chicago, April 30.—The Eureka Gun Club, of Chicago, held its regular weekly target contest on the club grounds, corner Seventy-ninth and Vincennes avenue. The day was one with an overcast sky, accompanied with continuous rain, which lasted until late in the afternoon. The attendance was small, but continued to shoot notwithstanding the elements. The wind blew strong in the face of the traps, which made the flight of the targets generally skyward.

Following are scores in practice events prior to the medal contest, which commenced at 3 o'clock P. M.:

Events: 1 2 3 4 5 Events: 1 2 3 4 5

Centredale Gun Club.

CENTREDALE, R. I., May 1.—Inclosed find scores of the third shoot for the C. E. Pope Co. trophy, held on our grounds Saturday, April 30. The event brought out twenty entries, the largest of the season. The scores made were not very good, but when the wind, which was blowing a hurricane, is taken into consideration, they were exceptionally good. F. I. Hammond and C. M. Staniels tied for first with 41 each, thereby receiving 5 points, and C. C. Griffith and N. H. Sheldon, tied for second, receive 3 points each; Mr. Thoen, third, 1 point. The score now stands Griffith 13 points, Sheldon 9, Hammond 6, Staniels 5, Gavitt 3, Greene 1, Thoen 1. The fourth shoot will take place Thursday, May 12, on the grounds of the Providence Club. Other events were shot, and about 2,300 birds thrown from the magautrap, which worked like a charm.

On Thursday, May 12, the Pawtuxet and Centredale clubs will try conclusions with the Providence Club for the State pennant, five men on a team.

Trophy shoot, 50 targets, unknown angles, wind 25 miles an hour:

Come, Bobbie, brace up, you have been fooling us long enough. Look out for Billy next time—three seconds, you know! But don't lose sight of Grif. How the Doctor did smile yesterday, I was glad to see it, for he hadn't smiled in a long time. Good luck to the new Pascoag Club.

N. F. REIMER, Sec'y, C. G. C.

Valley City Gun Club.

GRAND RAPIDS, Mich., April 30.—I am pleased to state that the Valley City Gun Club has taken on a new lease of life, and expects to have a vigorous campaign this season. Inclosed circular letter indicates the plans proposed, and prospects are that a lot of new blood will be infused into the club. Scores of last shoot here-with. In the trophy shoot Kelsey tied Beeson, who won it the week before on a score of 24, or 23 targets. In the shoot-off the next 25 single targets, or events 8 and 10, were to decide, and resulted Kelsey 22, Beeson 21. The Junior medal was a tie between Lisle and Rood on 16, and won by Rood in the shoot-off on 17.

The scores:
Events: 1 2 3 4 5 6 7 8 9 10

Dansville Gun Club.

DANSVILLE, N. Y., April 29.—The Dansville Gun Club held its regular practice shoot to-day. Again the April shower was with us. It may make May flowers, but it also makes unpleasant shooting, and consequently only a small number of shooters joined in the sport. The club will soon have the shooters' score under cover, and then, with the magautrap to throw the targets, we can bid defiance to the elements, and the shooting will go merrily on. The following scores were made:

Events: 1 2 3 4 5 6 7 8 9
Targets: 10 15 15 10 10 15 10 15

"For Targets Only."

THE fences between the professional trap-shot and the manufacturers' agents, on the one hand, and the fat tournament pastures on the other, are constantly being built longer and tighter. The campaigner belonging to those classes may perhaps enter the pasture, but he must not graze. Managers of tournaments are fast adopting prohibitory legislation as against the professional and agent which threatens to bar the latter from all profitable participation in the tournaments. It in a way goes further, and makes the professionals a source of revenue. The latter class, in most instances where a bar is raised, are not permitted to compete for any of the purses, though they are permitted to join in the shooting for "targets only," and further are granted the cheap privilege of displaying their goods.

It is no privilege to shoot for the price of the targets. It is a purely commercial transaction. It is quite misleading to set such forth as being a privilege, or as being anything of a material favor to the shooters in question. Stated simply, the clubs have targets to sell, and it is no special favor to permit customers to buy. Many clubs are very glad to have shooters enter for the price of the targets only, if the shooters refuse to play otherwise. They pay for what they get, and it would under the circumstances be difficult to make the average shooter believe that he was the recipient of any favor. The whole matter is then a business proposition. If the club can throw targets costing less than 1 cent each for 2 or 3 cents each, the club thereby adds to its revenues at every shot. Whether the shooter be a professional or a novice, the result to the clubs' exchequers is the same. It is a profit in either instance.

But in respect to the professional, such is not a justifiable tax, for the reason that he confers much of material value to the tournaments in general and in particular. There is a certain equity in the matter as between the interests of tournaments and the interests of professionals which tournament managers seem to overlook or to ignore. Let us consider a few of the benefits which professionals confer. They are indisputably a drawing card at a tournament even if they do not participate in the sweepstakes or other events which have prizes. The people at large are interested in seeing men who are champions, men who have defeated the best in the land, men who have records of victory, men who have achieved great fame. They are interested, further, in seeing these experts perform, whether in exhibition events or in actual contests. All this is of material value to tournaments, but there are other benefits still more material. They do much to advertise and influence support for the tournaments while traveling from place to place pursuing their vocation. A favorite class to whom to look for advertising, and which is regularly solicited for it, is made up of the employers of these same professionals who are so taxed for the privileges of displaying their goods practically. Such advertisements form a material source of revenue to tournament managers, and revenue cheaply secured, for such advertisements are donations in every respect but the one in name. Local advertisers may secure some return from an advertisement in a club's programme, but the great manufacturers look upon it as of no material value when the cost of it is considered. The outlay is a certainty; the return is vague, intangible, meager. One page of advertising at \$10 or \$20 a page does not amount to a large sum, but 100 or more pages taken by a dozen or more firms during the season amounts to a sum by no means insignificant.

The agents represent these same firms, and for the favors that are given in the way of advertising and merchandise, for they are called on frequently to donate the latter, something more than an empty privilege should be accorded. The cost of shooting at 150 or 200 targets a day at 2 or 3 cents each is quite an important item to the professional. It is an expense which the latter will not long accept. It is an expense for which he, from his standpoint, receives no adequate return. The privilege of paying \$5 or \$6 a day for targets and \$3 or more hotel bill is one which is empty of all advantage. His employers, moreover, may begin to study the matter of reciprocity. They contribute funds under the name of advertising, they give valuable merchandise prizes, they foster an incalculable good will toward the sport, and what is conceded in return under the new order of things?

This is no plea to permit the professional shooters and manufacturers' agents to have a part in the competition. That part has unmistakably been rejected by the public. FOREST AND STREAM has been on record against it from the time the subject became a live question. But on the other hand the legislation against the professional class should not be carried to an unjust and an unnecessary length. The manufacturers' agents and the professional shooters should be treated with more consideration in the matter of privileges. They should be conceded something substantial in the way of concession; something which is a privilege in fact as well as in name. The cost of targets to clubs is very little as compared with the receipts. They could throw free targets for the agents and professional shooters, or if a club felt too poor or felt that there should be a return of some kind, it could throw the targets at cost. In the latter case the club would lose nothing, and the agents would be in part relieved from a very oppressive and unprofitable expense. As shown above, this could not possibly be considered a gratuitous privilege.

In the way of gathering revenue quickly for tournament purposes and club advancement, there is danger of a kind of professionalism in a way in club management, and it can be carried too far by the club as it can be by the individual. There is, furthermore, a certain equity in these matters which may be lost sight of in a hasty and more or less prejudiced view in the readjustment of the trap-shooting policy of the country. Professionals are entitled to some courteous return for the direct benefits which they confer. In writing of manufacturers' agents in this connection, we consider them in their professional capacity only as it relates to the trap-shooting interests of the country. Being able to shoot too well, there are certain very well grounded objections to their participation in the contests at tournaments. That is the only objection. As men, they are a superior class—companionable, able, expert in their profession, and hard workers. Managers of tournaments would do well to cultivate a policy which would influence the professionals to be present instead of one which is sure to drive them away sooner or later.

The Interstate Association.

THE letter of Mr. Edward Banks, Secretary of The American E. C. & Schultze Powder Co., published in our issue of last week, defined the composition and purposes of the Association very frankly. While setting forth that it is a business venture, he, however, did not deign to dwell on the benefits conferred to the shooting public at large. It is but fair to touch on the advantages it confers.

The stimulation to shooting interests throughout the whole country before, during and after the Grand American Handicap is shot off, is a direct benefit to the shooting public in general, since it stimulates an interest and a practice in a wholesome recreation, with a corresponding benefit to shooters and dealers everywhere.

Nothing could be freer than the conditions which govern the Grand American Handicap. It is untrammelled by any trade restrictions. The contestants are free to use any makes of guns, or powders, or wads, or shells, or shot, etc., that they choose. It matters not what they use, they all stand on the same footing in the eyes of the Association; thus, while it is a business interest of the members of the Association, no trade interests govern the particulars of the Handicap. In the conduct of the Interstate tournament, no one who did not know the inside history of it would suspect that there were any trade interests involved in any way. They do not appear in it. It was not designed to promote trade interests directly. It was designed to be the biggest shoot in America, to have the approval of shooters, and thereby to have a general beneficent effect on shooting interests. Those who are not members of the Association are gainers by its efforts in the stimulation and impetus given by it to shooting.

The rapid growth of the fixture in value, in the number of its contestants, and in its prestige, is sufficient testimony to the wisdom of its builders.

In theory and in practice it is the one event which affords a chance to the greatest shooters of America to compete against each other on a scale broad enough to be considered international, where all meet on as equitable conditions as to handicaps as can be arranged by the best talent, where a purse of sufficient size and absolute guarantee is large enough in value to command the respect and effort of the contestants, and where a trophy of such additional value and such paramount significance commemorates the deeds and success of the victor. The names of the ten great manufacturers who compose the Association are a guarantee of the soundness, integrity and value of the great event. The latter furthermore, gains a prestige, both direct and reflected, under the Association's auspices, a difficult advantage for it to secure otherwise. Prestige and good will are a growth, even under the best conditions. Success and skill and fair dealing, through a longer or shorter period of time, always antedate prestige and good will.

AS TO A WESTERN HANDICAP.

There is no reason why the West cannot have a successful handicap event. Not necessarily a Western handicap event, but

a handicap held in the West. There is a distinction and a difference in the terms. There is no need of sectionalism, there is no legitimate reason for it, and there probably will be none cherished.

THE WESTERN PRESS.

The Western daily press, however, takes a very sectional and secessionist view of the matter. The Chicago Chronicle recently published this:

"Prominent local trap-shooters received a proposition yesterday from an organization interested in the sport that it carried out will revolutionize the game around Chicago, place it on a more substantial basis, and appreciably advance its prestige. It is proposed all the trap-shooting clubs in Cook county band themselves into one all-embracing organization, and this institution buy and equip grounds.

"If the projectors' extreme plans are adopted Chicago will have a pigeon shooting rendezvous that will surpass in its appointments anything of the sort ever before attempted. Elkwood Park, Long Branch, would be outdone.

"The plans of the promoters are the outgrowth of the dissatisfaction that prevails among many Westerners over the recent trip to Elkwood Park and the award of money in the Grand American Handicap. It is said this disgruntled feeling has reached such a height that Western men will never compete again in the East, therefore, and if possible to outstrip it in popularity are incentives that will probably result in a favorable consideration of the scheme.

"It has been often suggested to the Interstate Association to favor Chicago with the choice of location for the big handicap event. It is thought the tournament should take place occasionally in some other State than New Jersey. Easterners, it is argued, are convinced they have control of the event, and can run it pretty much as they want to."

The above is much in accord with the tone of the Western press publications on the subject since the handicap. It is more than likely that "the plans of the promoters are the outgrowth of the dissatisfaction," etc., are not the plans of the best representative shooters of the West. No enterprise, whose inspiring spirit is from spite, can succeed. There is room for a handicap in the West, but the shooters of the West should see that its origin is not in resentment.

AS TO SPLITS.

It has also been set forth that the movement toward a Western handicap is a split in the Interstate Association. Such is an error. There is no split whatever in the Association. If any shooter was dissatisfied or aggrieved, such was a personal matter strictly. If two or more were aggrieved, and pooled their grievances, there still was no split in the Association. The contestants entered as individuals, shot as individuals, and finished as individuals in the Grand American Handicap. When the handicap was ended, their official relations with the Association ceased. If a gentleman has a grievance, he is likely to overvalue it when he imagines it is splitting things.

However, the press reports undoubtedly exaggerate the discontent, if such there be, though it would seem to be the proper procedure for those who are misrepresented to repudiate the calumnious publications.

AS TO LOCATION.

The handicap being a private business venture, would as a sensible business policy be held in such place as would be most convenient for the majority of the competitors. A line extending from Elkwood Park, N. J., to Pittsburg, would be the radius of a circle which would take in about 75 per cent. of the contestants in the Grand American Handicap, which would dispose of that question when tested by business reasons.

The Interstate Association has no monopoly of handicaps. The more handicaps there are the better for its members. They are manufacturers first of all. If there were thousands of handicaps it would not excite their displeasure. The shooting interests then would be in such activity that no Grand American Handicap would be needed as a stimulant or an advertisement. The world, moreover, is large enough for all. There is plenty of room for more tournaments, more handicaps, more shoots, each a matter of business to itself alone.

THE SHOOTERS AND THE COMPASS.

The shooters who attend the Grand American Handicap are not as a rule shooting for their health. When they are shooting they do so without a compass. They do not care a hang where the north, south, east or west may be. Shooters who live in the East would gladly attend a shoot held in the West if they could see that it was worth their while. So with shooters who live in the West or the North or the South in respect to any other section. Men often hurrah for fun or for emotional reasons, but when they shoot for money, they consult some well-known business propositions, as is very proper they should when they are disbursing their own money.

A handicap or any other business venture can only succeed when it is arranged on sound and equitable business principles which are for giver and receiver alike.

It is to be hoped that the West will have a great handicap, that it will eclipse all records, that it will be conducted better than any which ever went before, and that it will continue the good work. From the shooters of the East it will receive praise and good will for such success if it can achieve it.

Pigeons at Memphis.

LITTLE ROCK, Ark., April 28.—On Saturday, April 23, the Memphis Gun Club held an invitation shoot, at which Drs. Brigier and Miles, Burnside, La.; W. R. Elliston and Norton, Nashville, Tenn.; A. Harris, Louisville, Ky.; and H. L. Foote, Rolling Forks, Miss., were the guests of the occasion. The club members also turned out in force, so that all told twenty-three shooters participated in the different events.

The principal event of the day was a 15-bird race, \$15 entrance, for the Laffin & Rand Powder Co. trophy. Naturally the most interest centered in this contest, which was spirited from start to finish, or rather until it was too late to shoot longer, at which juncture there were still three interested in the trophy. This event had nineteen entries, of which seven tied on 14 out of 15, no one being able to kill straight. It was decided to shoot the tie off in the next event, a 5-bird race, but this brought matters no nearer a conclusion, as all those interested killed straight. The miss-and-out style was then resorted to. The first one to lose out was Dr. Miles, on the 3d bird. He was in turn followed by Allen and Duncan on their 7th birds, and they again in turn by Harris on the 8th. Edrington, Neely and Frank still remained in and these, owing to the lateness, agreed to shoot it out at some future date. All of them are members of the local club.

Of the visitors, Dr. Miles and Mr. Harris showed the best form, Harris coming nearest to killing straight in the main event, his 14th bird going dead out of bounds. Abe Frank, as has been the case lately, had his nerve with him, losing but one bird out of 38, and that was dead out of bounds. Abe attributes all his trouble of late to his new gun. Neely duplicated Frank's great shooting, scoring precisely the same total out of a like number of birds. All stood at 29yds.

Edrington came next with a total of 43 out of 45. Tom Devine shot at 37 and accounted for 33 of these with his little 16-gauge. Singularly enough all his misses came in a bunch, a change of shells causing all his trouble. Poston shot well, though as usually recently unlucky, his misses occurring just at the wrong time.

The weather conditions were not of the best, being dark and threatening, with a drizzling rain at intervals.

The scores:

PAUL R. LITZKE

Boston Gun Club.

WELLINGTON, Mass., April 27.—Fourteen shooters found their way to Wellington to-day despite the lowering skies and a forcible wind that struck terror to the hearts of all the company, more particularly those who knew of an added yard or two handicap, the penalty of winning a first, second or third prize in the previous series.

The gale drove powder particles and card wadding directly back on the shooters, and with each one waiting with head averted for the storm to blow over, the shooting was somewhat slower than usual, though it is never particularly rapid. Regardless of all these drawbacks, some splendid shooting was put forth by three or four; two reaching even 90 per cent., which is clearly out of order on these grounds.

Sec'y G. F. Stevens and Capt. S. G. Miller, of the Haverhill, Mass., Gun Club, were visitors, whom all present were glad to meet. A more extended programme would have raised their percentages, as the final events found them becoming accustomed to the grounds.

The ninth event was arranged by request as a two-man team match, 20 targets. The scores footed Gordon and Woodruff 28, Miller and Stevens 26, Miskay and Horace 26, Hollis and Spencer 25, Jack and Hooker 24.

Events:	1	2	3	4	5	6	7	8	9	10

Brockton Gun Club.

BROCKTON, Mass., April 30.—The second shoot of our series was held to-day on the grounds of the Brockton Gun Club. Considerable shooting was done before and after the principal events, but I have only inclosed scores for the merchandise and watch charm events. Murdock, with a handicap of 4, and Barrett, with 3, were high with 24 each. In the watch charm event, Worthing was the winner, as Le Roy withdrew after breaking 25 straight again. The wind kept the boys guessing all the time. The next shoot will be May 14.

Merchandise event, 25 targets, entrance 25 cents:

Worthing.....	1111110011111110101011-20-3-23
W Murdock.....	11011111110111111011100-20-4-24
Barrett.....	111111111101110111011101-21-3-24
Stanley.....	110100110110111011000101-15-7-22
W Woodard.....	110001111101101110111011-17-5-22
Grant.....	11100100100110111011101-16-4-20
Scott.....	01101101110100001101101-15-3-18
Stork.....	0000111011011011011101-16-5-21
Allen.....	101011011001001110001001-13-4-17
Donahue.....	1010100010101001111101-15-7-22
Le Roy.....	1111010011110111111111-21

Watch charm, 25 targets, entrance free:

Worthing.....	111111010111110111011111-21-3-24
W Murdock.....	110111111101110110011000-17-5-22
Barrett.....	001011011011001100011010-14-3-17
Le Roy.....	1111111111111111111111-25
Scott.....	11100011011011001011011-16-3-19
Grant.....	1111111011000011110110-18-4-22
Leonard.....	1010100010001001001100-9-9-18
Allen.....	10100110110111100001101-15-4-19

Both events were shot under the Sergeant system. A. BARRITT, Sec'y.

Uxbridge Gun Club.

UXBRIDGE, Mass., April 30.—The Uxbridge Gun Club held its first practice shoot to-day. The following scores were made, which are "not so worse," considering that a gale was blowing across the field.

Doubles and unknown traps are included in the averages, and this was the first appearance of most of the shooters at the traps since fall:

Shot	at.	Broke.	Av.	Shot	at.	Broke.	Av.
Noyes.....	136	85	.625	Sweet.....	125	91	.730
Rawson.....	60	29	.483	Gibson.....	80	44	.560
Ford.....	129	104	.806	Day.....	75	56	.746
Coffin.....	149	99	.664	Mansfield.....	20	5	.250
Johnson.....	154	75	.580				

Club average...908 588 .647

The club grounds have been neatly and scientifically arranged for this season. A modification of the Sergeant system has been adopted, which permits both the old style of throwing and an imitation of the magautrap. Practice shoots will be held every Saturday at 2 P. M., at which members of other clubs are cordially invited to shoot.

The following officers have been chosen for this year; Waldo E. Rawson, President; E. A. Mansfield, Vice-President; Geo. F. Day, Treasurer; Walter S. Hobbs, Secretary, and E. A. Ford, General Manager.

It is probable that shoots for gold and silver medals will be held in the near future. WALTER S. HOBBS, Sec'y.

Audubon Gun Club.

BUFFALO, April 30.—The Audubon Gun Club took advantage of the weather to-day. The monthly cup shoot was the chief event. Three men qualified by getting 24 of their birds. They were E. F. Hammond, H. D. Kirkover and Dr. E. S. Carrol. In the shoot-off Dr. Carrol won.

C. S. Burkhardt won Class A badge by making a clean score of 25 birds. J. J. O'Brien and Crooks tied for Class B badge, and O'Brien won by default. D. Kerew and U. E. Storey tied for Class C badge, the former winning on the shoot-off. Following are yesterday's scores:

FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

TERMS, \$4 A YEAR, 10 CTS. A COPY. }
SIX MONTHS, \$2. }

NEW YORK, SATURDAY, MAY 14, 1898.

VOL. L.—No. 20.
No. 346 BROADWAY, NEW YORK.

The FOREST AND STREAM is the recognized medium of entertainment, instruction and information between American sportsmen. The editors invite communications on the subjects to which its pages are devoted. Anonymous communications will not be regarded. While it is intended to give wide latitude in discussion of current topics, the editors are not responsible for the views of correspondents.

Subscriptions may begin at any time. Terms: For single copies, \$4 per year, \$2 for six months. For club rates and full particulars respecting subscriptions, see prospectus on page iv.

WAR AND YACHTING.

THE present situation is unprecedented in American yachting; and it is no wonder that, as shown by the very different action of various yacht clubs, a great divergence of opinion exists. Just at the opening of the yachting season, when under normal conditions a very large fleet of steam yachts and many sailing yachts would be nearly ready for commission in cruising service, and the racing division would be ready for the opening races, the country is involved in a foreign war of serious magnitude and unknown duration. Headed by the Larchmont Y. C. at the opening of actual hostilities, some clubs at once canceled all the events scheduled for the season, and practically abandoned all yachting for an indefinite time. The majority of clubs, however, have taken no action beyond the formal tendering of their stations for the use of the Government; and propose, for the present at least, to continue the usual work of the active season.

As the outlook is to-day, on the eve of what may be the decisive action of the war, the meeting of the two great fleets of the United States and Spain, we see no good reason why this is not the wise and proper course. Whether a man's position and duty demand that he shall stay at home or go to the front is a question which each individual must decide for himself; but after it is settled there must inevitably be a very large number of men left at home to follow the ordinary avocations of peace. There is no apparent reason why, with their usual labors, they should not enjoy their usual amusements; and whatever may be argued against certain amusements as frivolous and inappropriate, yachting cannot be included in this category.

While it is impossible to forecast in any way the final results of the war, it now seems impossible that Spain can long continue the struggle; and it is not unlikely that peace may come before the racing season is fairly under way. If this should prove to be the case, yachting will naturally resume its usual course; and in anticipation of such a happy termination, those who are in the position to do so are, we believe, justified in continuing the work of preparation. If, on the other hand, the emergency should at any time assume a more serious aspect for this country, it will no doubt be met by the prompt and willing abandonment of all forms of sport.

SNAP SHOTS.

This is the time of year when the fishing fever takes hold upon one. To some people the term "fever" is a figure of speech, an exaggeration; but the victim knows only too well that the malady is actual and serious. When springtime comes, to go fishing is, as William C. Prime says, "a necessity" with the angler; and the sensation is just as real and as urgent and pressing and disquieting as of hunger or thirst. Fortunate is he who, having the time and the means, possesses also the privilege of fishing some stream not yet fished out nor hedged about with warning posters. Lake fishing there is for all, and in abundant scope; and stream fishing, if one may go far from home; but it is one of the angling transitions of America to-day that year by year available brook and stream fishing for trout is becoming more and more restricted. The trespass sign is everywhere, even where there are no fish. The unaffiliated angler without club privileges finds it more difficult with each succeeding springtime to secure a chance for love or money to wet a line in nearby trout waters. These conditions have naturally developed the canny trait of wariness and a well-pronounced and controlling unwillingness to report one's luck in quarters which others might invade. The wise fisherman who has a good thing cultivates the art of keeping it to himself. Ask him where he got them, and the response is a shrug or a

wink; but not once in a dozen times will definite and explicit directions be given—unless the teller has a club share for sale. This art of keeping a secret is the modern manifestation of that trait referred to by Walton when he bespoke a blessing upon them who are "quiet and go a-angling."

Is a sportsman's gun furniture? The question has just come up in connection with the customs regulations. The tariff law admits free "usual and reasonable furniture," and under this provision Mr. Robert Quinn, who removed from Hamilton, Ont., to a residence in this country, sought to bring in his gun without paying duty on it. Assistant Secretary of the Treasury W. B. Howell has decided against this, however, holding that a sportsman's gun is not entitled to free entry as part of his household effects; and he intimates that if Mr. Quinn is not satisfied with the decision he may take the matter on appeal to the General Appraisers. An ingenious lawyer could doubtless make up a good case for the gun as furniture, citing the pertinent fact that in this country from earliest times it has had place as a customary article of household equipment. In the old days indeed the rifle was an essential and indispensable part of the settler's outfit; it held first importance in making and defending the home. And in these later days, in scores of instances, the sportsman's gun is actually less a field weapon than an article of home adornment or furnishing. In this connection it is interesting to note that our consuls in Belgium report in the gun centers there a rapidly growing trade in antique and obsolescent firearms for export to the United States, where they find a ready market for decorative purposes.

Some years ago, when it was suggested that dogs running deer contrary to the law should be killed, vigorous protest was made by writers who pointed out that the dogs were not at fault and that to punish them with the death penalty would be unjust and brutal. Since then, however, the practice of dog killing under warrant of law has been pursued. The statutes of New York and other States provide that dogs chasing deer may be killed by any person, and that no liability shall attach therefor. In the Adirondacks the regulation has just been made more stringent than ever before; there all dogs which are of deer-chasing proclivities, found in the country inhabited by deer, are condemned to death wherever apprehended, whether at the time actually chasing deer or not; and it is made the duty of the game protectors to kill them summarily. The new rule is manifestly founded upon common sense appreciation of the nature of dogs and of men. Law or no law, there will be deer hunting in a deer country so long as there shall be deer and hounds, and men to incite the hounds to run the deer. If deer hounding is prohibited deer hounds are rightly contraband. Nevertheless it would go hard with many a good man thus to part with his good dog; and time itself, which heals all wounds, would not soon alleviate the bitterness of soul caused by the heartless doing to death of a favorite hound.

An English author points out that the dry-fly writers who speculate about the origin of their art may go back to Izaak Walton, who wrote: "And when you fish with a fly, if it be possible, let no part of your line touch the water, but your fly only, and be still moving your fly upon the water"—not "in," but upon the water. And it is further pointed out that Cotton instructs, in fly-making: "Leave the wings of an equal length; your fly will never else swim true."

French ingenuity has devised a gun of which the novelty is that the noise and flash of the discharge are in large measure eliminated. Colonel Humbert, the inventor, has experimented with a piece having a caliber of one and a half inches, on to the muzzle of which is screwed a block having a bore similar to that of the gun, and being in effect an extension of the barrel. In the bore of this block is fixed a shutter, which lies in a recess in the side of the bore, until on the discharge of the gun the ball has passed it, when the gases following the ball are forced under the shutter, lift it on its pivot, and thus closing the passage prevent the exit of the flame and gas. The gas thus checked finds gradual escape through a number of small apertures on the rear

end of the muzzle block. In small calibers a ball is substituted for the shutter. This is another way of achieving the result sought by the smokeless powders. If an actually noiseless gun were provided for use on game it would materially change the conditions and surroundings of shooting; and if the Frenchman gives us a gun which has no visible discharge we shall be obliged to modify our stories of the wary loon which dives at the flash.

Fishermen in St. Lawrence River waters this year will have a number of free camping grounds assured to them. Under the authority conferred upon them to secure lands in the region of the international park at the Thousand Islands, the New York Commissioners of Fisheries, Game and Forests have already secured six plots, and have several others under consideration. The lands acquired, with the prices paid for them, are as follows, the data being furnished to us by President Davis:

Mary Island, at foot of Wells Island, near Alexandria Bay, \$5,000.

Foot of Grindstone Island, seventy acres, containing camp grounds of the American Canoe Association, \$4,200.

One-half of Cedar Island, at mouth of Chippewa Bay, about fifteen acres, \$3,000.

Krings Point, at mouth of Goose Bay, below Alexandria Bay, thirty-two acres, \$2,300.

Dewolf's Point, in Lake of the Islands, ten acres, \$500.

Cement Point, at head of Grindstone Island, three acres, \$500.

The Spanish war is having an immediate and material effect upon the forestry interests of the Adirondacks. War news and war news fakes have so stimulated the manufacture of extras and so increased the regular daily issues of some of the New York newspapers that the demand for news paper has almost doubled. News paper is made of wood pulp, and wood pulp is made of Adirondack material. Thus it has come to pass that in reckoning up the effects of war consideration must be made of the wilderness forest supply.

The New York Police Department has very unwisely abandoned the system of revolver practice under which the force was gradually acquiring such skill in shooting that an officer's endeavor in the public streets to kill a "mad" dog did not necessarily involve the wounding or death of human beings on the other side of the street. The shooting as conducted was economical in the extreme. The city paid nothing for the armory in which practice was held; the loading was done by members of the force; 90 per cent. of the lead was used over again; and the direct expense was for paper targets, powder and primers; the discontinuance, then, was not due to any consideration of cost. It appears to have been prompted simply by a desire on the part of the Commissioners to please the men, who complained that they were required to learn to shoot when they would much prefer to be following their own inclinations in various other ways. Under present conditions, then, the force may be expected to revert to the former state under which the drawn revolver of a policeman menaced the lives of all within range.

A writer in the current Independent sums up this history-making epoch for Africa by remarking that we are now beholding the subjection of the entire continent to European domination, and now for the first time in the history of the world is the black race to work under the direction and control of the white. European ideas will prevail and European ways be enforced. This is true even with respect to the game situation. Henceforth the big game of the continent will be conserved by rigorous restrictions, such as already prevail in the British East African Protectorate and in German East Africa. Not only is elephant hunting controlled by a strict license system, but vast territories are set aside as sanctuaries for game, which ivory hunters and sportsmen are prohibited from entering. Thus one of the resources of the native wealth of the country, which in the absence of any effective control bade fare to meet early ruin, may under the wiser administration of Europeans constitute a source of revenue for decades to come.

The Sportsman Tourist.

Antoine on the Rail.

NEAR the close of a September day several of the frequenters of Uncle Lisha's shop were gathered there, not lounging in their usual ease, but stirred by an air of expectancy which was explained when Solon Briggs entered and demanded: "Wal, what be you all a-settin' here in solemn concave for?" and Uncle Lisha answered:

"Wal, ye see, Ann Twine's got hum from his hayin' tawer daown to the lake, and they say 't' th' critter act'ally rid on that 'ere railroad they been a-makin', leastways he says he did, an' we want to hear him tell on 't. He'll be up here to rights, full on't an' b'ilin' over. I don't see what's a-henderin' on him."

He arose and stooped to the low long window, and slowly searched the road through the least dusty and least wrinkled pane. "I can't see nothin' on him," he reported, sitting down on his bench and fumbling among his tools with a show of busying himself.

"A watched pot won't never b'ile," Sam Lovel said; "you don't want to be a-lookin' for him."

"I don't s'pose it r'aly makes much odds whether no we hear him tell on 't, or guess at it; he does tell such almighty yarns," said Uncle Lisha, "but most likely he's seen the consarn, an' we'll git some idee o' the looks on 't by his tellin'."

"It don't sca'cely seem 's 'ough I'd much livser resk myself on the pleggy thing 'n I would in a boat," said Joseph Hill, and added after some consideration, "but then if you fell off'm on 't you wouldn't draound, an' I don't s'pose the's no danger of'm sinkin', an' they don't hafter be oared. I wonder what does make 'em go, anyway."

"Why, you see, the b'ilin' water covaporates into steam," Solon explained, "which the steam causes the wheels to devolve, sim'lar tu a waggin, an' it nat'rally follers the hul thing hes got tu go. Watts invented it one time when he sot by the stove discomposin' of a hyme, an' the tea kittle b'iled over. The' was a piece cum in the paper about it."

"You see haow 't is, don't ye, Jozeff?" Sam asked. "Seems most as if you could go right tu work an' make one, don't it?"

"They du say 't you can see the steam on't from the top o' Tater Hill, a-skin' along ju' like the smoke of a chimby dragged ag'in' the wind by the small eend," said Pelatiah Gove, slowly ruminating his cud of spruce gum.

"Folks 'll be a-flyin' next," Tom Hamlin predicted.

"They hev done that already heretofore," said Solon, "them airy knots in the berloons."

"I tell ye, I b'lieve the world's a-comin' tu an eend 'fore long," said Timothy Lovel, his serious face almost expressing alarm. "You know it tells 'n the Bible the'll be much goin' tu an' fro on the airth for one sign."

"Sam Hill!" Joseph ejaculated with unusual earnestness, "if it's got tu this year it most seems 'ough I'd jes' 's lives hev it come afore 'tater diggin' as just arter. But I don't s'pose M'ri' 'd be satisfied if she didn't get all done haouse cleanin' fust. Hello! I b'lieve that 'ere's Antoine a-comin'," and presently the Canadian entered with modest consciousness of his importance as a distinguished adventurer, yet greeting his friends with accustomed "Hello, Onc' Lasha, an' all de boy, haow ye was, tout la companie?"

There was a cordial response, and after shaking hands with everyone he seated himself and made a comprehensive survey of the company, while he was the object of a close scrutiny.

"Wal, sah, boy, Ah'll a'n't see but you was all look matchel," he declared, when he had completed the inspection, and his eyes again dwelt on Uncle Lisha.

"Bah gosh, Onc' Lasha, you'll a'n't get more hol' you was w'en Ah'll go 'way!" which was indeed remarkable, since Antoine had been absent a whole month.

"Wal, I do know but what I've kep' up my row tol'-able well," the old man admitted. "An' you b'en pooty tough, hev ye, Ann Twine? An' fetched hum yer pock-ets all full o' money, I s'pose!"

"Wal, Ah'll a'n't goin' bought all of Danvit jes yet, only half of it, Ah guess, prob'ly," said Antoine, making conspicuous use of a brand new red and yellow cotton handkerchief.

"We heard 'at you'd be'n a-buyin' some o' that 'ere new railroad."

"Oh, dat a'n't so, Onc' Lasha," Antoine announced, "but Ah'll was see lot of it, an' seh, Ah'll r-r-ode on it, bah gosh! Yes, sah, Ah'll r-r-ode on it, me!"

At this there was a general pricking of ears, and each settled himself more comfortably to give undivided attention while Antoine deliberated how to begin the relation of his adventures; he filled and lighted his pipe.

"W'en fust Ah'll see dat rail roll goin', an' hear all hees nowse, Ah a'n't t'ink Ah'll rode on him, for hees mos' more worse he look, so hugly, an' he roar an' holler more hugly as he look. But bum bye Ah'll gat use of it, for see it ev'ry day where Ah'll work on de hayin', an' a'n't be so 'fraid."

"More as dat, Ah'll see Airishmans, more as forty, rode on de woggin behin' of it for to sow gravel on top de rail roll, an' he'll a'n't keel it, an' Ah'll t'ink 'f he a'n't keel dat Airishmans dat was better for be keel as mos' anybody. Ah guess, me, he a'n't prob'ly keel one Franchman dat was bes' for be save!"

"So w'en Ah'll gat hayin' all do', Ah'll mek off mah min' Ah'll goin' rode on dat rail roll, so Ah'll be able for tol' all 'bout it 'f Ah live."

"Wal, seh, Ah'll go on de deeple—dat de place w'ere rail roll stop for you git on—an' Ah'll bought tickle—jes' same for show—fifty cen' Ah'll pay—den Ah'll go on de warf an' walk raoun' jus' sem 'f Ah don' care no more for rail roll as 'f he was leetely weel-barrel."

"But Ah tol' you bam bye w'en Ah'll see him com-in' an' look jus' 'f he was goin' run raght top of me, an' holler 'whoop! whoop!' an' rung hees bell lak meetin'-haouse, an' smoke lak' coal pit an' bile 'f he was goin' bus' off hees cover, 'spe-e-e-e!' bah gosh; Ah'll willin' for sol' mah tickle for twenty-fav cen' an' Ah'll run in de deeple an' peek aout de door till dat rail roll stan'

still an' de capt'in come on de w'arf an' holler 'All board!'

"Den de deeple man push me an' tol' me 'jomp on!' an' Ah'll run fas' for clamb on de hwood pile behin' de injun, an' deeple man holler 'jomp on de cart, an' de capt'in mek notion wid hees han' an' Ah run, run w'ere he was, an' he push me up de stair on de canawl boat dey call cart, an' mos' 'fore Ah'll got hopen de door de rail roll begin for rung hees bell sem 'f meetin's all ready, an' he beegin cough 'ugh—ugh!' an' dat canawl boat jomp so Ah'll go in on mah all four, an' de folks laught so Ah'll pooty shem, Ah tol' you, Ah'll a'n't lef' mahself dar long 'fore Ah'll peek it up, an' set on fus' seat Ah can."

"It was all cushi'n harm chair for two folks; two row of it, wid road between of it, an' all jes' nice he can be, winder all 'long de side an' one on de en' mos' lak Onc' Lasha is, honly it gat but jus' one—ah—feel bad."

"One what?" Uncle Lisha asked.

"Why, w'at you call it one piece glass—ache?"

"Oh, good airth an' seas, pane!" Uncle Lisha shouted.

"Yas, dat jus' de sem, Ah'll said," Antoine said, with the utmost complacency, and improving the interruption of his story to light his pipe.

"Wal, sah! pooty soon dat rail roll stop for cough an' go more fas' an' fas', mos' lak litlin', an' Ah'll t'ink he said all de tam 'Ho, you a'n't know where you was go,' an' mah heart mek answer inside of me, 'Ah b'lieve dat so, Ah wish you go a lit' more slow.'"

"An' w'en Ah'll see all de tree run race an' de fence streak lak ribbin in de win', bah gosh, Ah'll was mos' scare an' wish Ah'll a'n't come, but Ah'll hang on de seat lak good feller, Ah tol' you. Den Ah'll look see if de odder folks was scare, but some of it was talkin'. Ah'll can heard it, honly see hees mout' go, an' some of it was read on de paper, an' one hol' hwomans was heat off hees baskit all de tam, an' Ah'll t'ink if dey a'n't scare Ah'll a'n't scare too."

"Den Ah'll look in dat leetly winder Ah'll tol' you baout, an' dar was lot more folkses in dar; some of it read on de paper, some of it talkin' an' 'nudder hol' hwomans heatin' off hees baskit all de tam, an' dar was one manis look like Frenchman, an' he was look so hard at me Ah'll mek bow at him, an' he mek bow at me. Den Ah'll grin at it kan o' pleasant an' he do jus' de sem. Den Ah'll blow mah nose of mah new hamper-cher, an' bah gosh he was pull one jus' lak it for blew his nose! Dat make me beegin for be mad, have mek fun at me, an' Ah'll look pooty hugly at dat feller Ah'll tol' you, an' he look jus' so hugly to me!"

"Ah'll shake mah fis' to him, an' he was shook hees fis' to me, and bah gosh Ah'll was be mad for leek it, Ah tol' you. Ah'll t'row mah hat, Ah'll jomp on it, Ah'll pull mah hairs, Ah'll holler grea' deal swore, an' dat feller do jus' sem lak me, an' bese of it faght so hard dat way lak hol' t'under more as fav minute; an', seh, dem folkses a'n't scare 't all, but dey was laught lak ev'ryting, an' den Ah'll stop for gat mah breeze, an' den, seh, w'at you t'ink Ah'll fan' aout. Wal, seh, dat winder a'n't not'ing but lookin' glass, an' Ah'll be'n was'e all dat faght on mahself, Ah'll a'n't tam for be shem 'fore de capt'in come in de sloop an' holler 'Vairgenn! Vairgenn!' and den de rail roll holler 'Yooloop! yoop!' an' beegin for go slow, an' w'en he mos' stop Ah'll scrabble for de door, an' den he stop quick 'r-r-roop!' An' Ah'll go on all mah four 'g'in, jus' sem Ah come in—so Ah'll go aout, an' mos' 'fore Ah'll gat on de w'arf de capt'in holler 'All board!' an' de rail roll ring hees bell an' beegin for cough, an' nex' Ah'll see Ah'll a'n't see it honly de smoke an' de nowse of it, sayin', 'Got your money! Half a dollar! Got your money! Half a dollar!' but Ah a'n't care 'f he was, Ah'll gat mah wort' of it."

"Wal, I don't b'lieve I want tu resk myself on the 'tarnal contraption," Uncle Lisha declared.

"It don't sca'cely seem 's 'ough I would, anyways, erless they'd 'gree to go slow, an' stop an' le' me git off when I wanted tu," said Joseph.

"Look a-here, Ann Twine," said Uncle Lisha, rising and going to the door of the kitchen, "you go in an' tell the women folks 'bout it, if you'd jest as livs, for I know they're dyin' tu hear on 't."

Antoine was not loth to comply, and the old man closing the door for a moment behind him whispered gustily to the company, "I'll go 'long in an' see if he tells his story twicte alike."

ROWLAND E. ROBINSON.

Just About a Boy.—XI.

THE old black canoes had served their time and were not worth keeping over winter.

Their canvas sides had fallen into that "touchy" condition which ends the usefulness of canvas as a boat material, and the tough elm ribs had become water-soaked and lame from hard usage.

The boy and I drydoctored these two little cruisers, overhauled them from stem to stern, added a few touches of paint, a brace here and there, and then concluded they would last until the "glass" ice should form on the river.

"Say, I'll tell you what less do," said the youngster, "less git our outfit 'n float down the river far as we can 'fore it freezes; nen let the canoes go 'n come back on th' train, will yeh?"

I smoked over this idea a little while and thought about the ducks, snipe, squirrels and fish that lived along the little river.

Then there were the glorious mornings, the hazy days of Indian summer, when one wants to do nothing but float, float, float all day long—float until the painted sky blazes across the west and it is time for a blue wisp of smoke to twist upward through the red and yellow leaves.

A-a-a-nah! my tillicums, those are days of joy, and I saw many such days as I mentally reviewed the winding length of river that twisted among the hills to the southeast until it came to the yellow flood of the old Missouri, two hundred miles away.

"Yes, I will float on the river with you until the ice stops us or until there is no more river to float on," I answered.

It did not take more than a couple of days to prepare for the voyage, and it was with a satisfied feeling of enjoyment that we pushed out into the current that hurries away from the dam where the boy caught his "spick'el."

"We'd ought to make twenty er twenty-five mile 'fore sundown, hadn't we?" asked the boy.

"See here, son, you must want to cut this voyage short, or else go clear to the Gulf. Why not take it easy? We've only got a matter of two hundred miles to go to get to the Missouri, and that old river is good for nothing but sturgeon and shovel-nosed catfish, which we as sportsmen and voyagers on discovery bent want nothing to do with."

The boy smiled a queer little smile and said: "Huh! guess yer right."

We put a little bit of good, outdoor muscle on the paddles as we shot through the shallow riffles below the dam, and left a rippling wake through the "still hole" that ran past the big walnut trees and ended at the island where I first met the boy.

"That's where I snagged that ole Balaam first time I tried your rod. Gee! I had a picnic that day! Wonder I didn't bu'st yer tip, wasn't it?" the boy said, as we slid down the boiling riffle and passed the bridge pier in midstream.

We were still in town and had two more bridges to pass before we should run out of the settlements, and we were anxious to get into the wilds.

"Pisht! pisht!" said the double blades, as we glided on down the shadow-decked current, and the gurgle under the bow sang the travel song that is dear to every canoeist.

The bridges were a mile behind when we shot around a sharp curve at the foot of a riffle, and brought consternation to a troop of girls who, clad in old, discarded dresses, were splashing about in the shallow stream, trying to make themselves believe they were swimming.

Immediately there was a skurrying into the bushes, as these soaked mermaids went up the bank helter skelter, frightened out of a year's growth by the appearance of these two silent black shapes on the swift current.

We caught a fleeting glance of a bit of "local color" too, as one of the girls went into the bushes like a scared rabbit.

Her bathing costume was a suit of bright red underwear. No wonder she ran!

After the excitement died out, and the titters and little screams had lost themselves astern, the boy looked back over his shoulder and grinned as only a homely boy can.

"Funny, wasn't it, huh?" he asked.

As we turned the bend a mile below we noted that same scarlet note of color just at the river edge, and the boy grinned again.

Riffles and long reaches of still water slid under the keels as we journeyed on, until a bunch of cedar trees loomed blue through the other timber.

"Did I ever tell you how Deacon Lowe got scart out o' camp down here at the cedars?" asked the boy.

"No, I don't think so," I replied.

The boy laughed in his throaty, chuckling way, and began the yarn.

"I was campin' down here 'lone one summer, 'n Deacon he wanted to come 'long. I says 'All right,' 'n so Deacon come down with me one day when I went to town for supplies."

"We was here two er three days, 'n one night 'bout sundown Deacon heard a Bob White whistlin' up on the bluff above camp, where they's a grove o' little jack oaks."

"Go 'n git him, Deacon," I says, 'n Deacon took my ole Sary 'n went."

"Purty soon, 'boom!' she went, 'way off 'mong th' trees, 'n I figgered Deacon 'd sure got that quail."

"After awhile he comes into camp with th' quail, 'n lookin' kind o' funny an' pale."

"What's up, Deacon?" I says, 'n he says: 'They's a graveyard up there right above camp on the bluff, d'you know that?'"

"I laffed 'n says: 'Yes, what o' that?'"

"Deacon says: 'You goin' to stay here when yeh know that?'"

"Sure," I says; 'graveyards can't hurt yeh none, 'n 'sides that, ain't I been here for two er three weeks, 'n no ghost ain't come into camp yet?'"

"That kinder stuck Deacon, 'n he didn't say nothin' more 'bout it while we eat supper, but he kep' lookin' toowords that graveyard kind o' uneasy when it begin to git dark."

"Fin'ly he says: 'I'm sick.'"

"What's the matter?" I says, 'n he couldn't tell, only 'at he was sick."

"Well," I says, 'you stay in camp here 'n I'll go 'n 'tend to the boats, nen if you feel worse I'll git a horse 'n buggy 'n take you to town.'"

"So I went down to where the boats was tied, 'n by gee! there was about a dozen folks come down with a horse 'n wagon to fish all night."

"I told 'em I had a sick pardner, 'n one feller says: 'Where is he? I'm a doctor,' he says, 'n my medsun case is in th' wagon.'"

"So he got his medsun, nen we went up to camp, 'n gee! they wasn't no Deacon there!"

"I thought that was funny, 'n I commenced to git scart, cos I thought mebbey Deacon 'd got out o' his head 'n went a-trailin' off int' th' woods right at night."

"Nen I happened to think about that graveyard, 'n I says: 'Wait a minnit,' 'n I run up on t' th' railroad 'n looked toowords town, 'n there was Deacon hittin' th' trail like he was in a awful hurry."

"Nen I kind o' savied like 'n knowed th' Deacon was juss scart 'bout th' graveyard tull he thought he was sick, 'n so I told th' doctor 'bout th' graveyard, 'n he laffed 'n said: 'Prob'ly that was all 't ailded Deacon.'"

"N' sure 'nuff it was too, 'cause Deacon wouldn't come back to camp with me when I went to town next day. 'Huh, uh,' he says; 'no graveyard camp in mine,' he says; nen I told the ress o' the fellers 'n town 'bout it, 'n Deacon gits it 'bout bein' ghost sick yet sometimes."

"Say," with a squint at the low-hanging sun, "less camp there to-night; they's a good place, 'n lots o' fish, 'n th' bess spring in th' country 'bout a hunderd yards fr'm camp. What d'yeh say?"

"All right."

And strange to say, no ghosts molested us, though we could have tossed a stone into the burial ground with its old graves, long since fallen in and choked with dank weeds that hid the little weather-beaten crosses placed to mark a loved one's last camp, long ago.

There was a melancholy air over that little spot of sacred ground there on the slope of hillside where the jack oaks grew, and I wondered what scenes of sorrow had been ended there in days that were older than I, as I read the weather-worn chisel marks that told of youth and old age at rest under the few modest slabs of plain marble that gleamed white among the crosses.

"Putty place up here, ain't it?" said the boy, looking across the landscape, as we wound our way down the bluff and into camp, and left the cedars to sigh over the deserted, unnoticed graves.

EL COMANCIO.

Tenderfeet in the Adirondacks.

ONLY an old pair of wading boots on which I have been placing a patch or two, but they recall so vividly the occasion when I last wore them that I am encouraged to spin the yarn, in the hope that it may give to other brothers of the angle as much pleasure as I have received from similar tales appearing from time to time in the columns of our honored journal. The sympathetic veteran may recall, as he reads, like mishaps of his own in the hazy past; the tyro will certainly perceive how not to do it. The frequent occurrence of such incidents will vouch for me when I say that this one is true in every detail.

All who were out of doors at all last summer will recall without difficulty the amazing quantity of rain that fell in New England and New York at odd times, and the Adirondack region got its share of the general washing. I was stopping at Saranac Lake, and though not primarily bent on angling, took every opportunity for excursions to the various waters about that town. I will say, to begin with, that I am a tenderfoot of emerald hue, as far as Adirondack woods are concerned, though I have fished the streams of Massachusetts, Connecticut and Vermont ever since that happy period when, as youngsters, we used to carry our worms in one pocket and our fish in the other. But 'a little learning is a dangerous thing,' and my experience of angling in a settled country only rendered me the more certain to make mistakes in a genuine wilderness.

Rumors of a fine stream seven or eight miles up Saranac River had reached our ears, and Joe (my friend) and I decided to try our luck there, availing ourselves of a convenient electric launch, which made two trips a day from the village to the old State Dam from the neighborhood of which a path led to Cold Brook, as our objective stream was called. On a fine, but deceptive, morning in August we started. The launch had not made half the distance when up came the usual clouds and a fine drizzle began. We did not mind getting wet, however, and the clouds did not look very heavy (when do they look heavy to an angler bent on a day's sport?), so we persisted in our determination to fish Cold Brook. After a tramp of three or four miles through the woods, where horse flies seemed thicker than the raindrops, we heard the rush of the brook and were soon on its banks joining our rods. It is a beautiful stream, of good size, clear and cold, and—best of all—with very little overhanging foliage to interfere with one's casting. We were soon busily at work fishing down the brook which we intended to leave by another path lower down, and so return to the landing on the river. Alas for our intentions! But for the present we were thoroughly enjoying ourselves in spite of the rain. There were good trout in the brook, and they were on the rise. I had not been fishing five minutes when I landed one of nearly a pound, and smaller ones were common. We lunched under the shelter of some thick hemlocks, which served to break the force of the rain. But who minds rain when the trout are rising? As the afternoon wore away and the time began to draw near when we should have to start for the landing, we kept looking anxiously for the entrance to the path, but either we had passed it or had not reached it; at any rate no sign of anything like a path appeared. And here is where our tenderfootedness began to show itself. Instead of facing about and retracing our steps to the landing, a round-about but uncertain route, it seemed an easy thing to follow the brook down to the river, which we thought could not be far away, and then follow the river down to the landing.

But we reckoned without taking due account of the length of Adirondack brooks in general and of Cold Brook in particular. It seemed as though we had gone two miles after deciding on this course, although it was probably less, and still no sign of the river. The brush along the banks became thicker and thicker, and all who have been in the woods know that nothing is so wet as brush in a rain. A shower bath is dry beside it. It was growing dark rapidly, and we could not have followed a path had we found one. The time for the launch to leave had gone long ago. Finally we came to a dead halt and held a council of war. It was evident that we were in for a night in the woods, and we accepted the situation philosophically. But where to spend it and how to keep warm? The first question was easily answered, for well up the brook we had seen a small lean-to built by some previous fisherman. As to the second, a thorough search revealed the appalling fact that we had but one match between us, and that was suspiciously damp. However, I tore some dry paper from the interior of an old letter and wrapped it carefully about the precious object.

Thus, all rain-soaked and weary, we slowly began our tramp back up the brook, which we had descended at breakneck speed. It was now entirely dark, a fact that caused us to make the brook our path wherever we could. Ever and anon I would stop to empty from my boots the water which collected there after percolating through my clothes. Joe was better off in this respect, for he wore shoes which allowed the water to escape.

After over an hour of alternate tumbling about in the bushes and splashing through the brook we reached the lean-to and were rejoiced to find that the roof shed water, although the moss and leaves forming the floor fairly oozed with moisture. We were oozing too, however, and we did not mind a trifle like that. Now for a

fire! Selecting a spruce board from a pile left by some one near at hand, I whittled away the damp exterior until I reached the dry wood within. As fast as the shavings were made Joe placed them under his felt hat, the interior of which was the only dry thing he had. Nearly all our letters were soaked by this time, but we still found a few dry sheets from which we hoped to kindle the wood. Very carefully I unswathed the precious match, and producing a small file from my fly-book, prepared to make the great attempt while Joe held his hat over my hands. I scratched. The match sizzled bravely and emitted a momentary flame. We uttered a shout of hope. But alas! the next moment it expired, before it had even scorched the paper. Ah! the tragedy of that moment! Gone was our last hope! We knelt there for a full minute, gazing at that burnt stump, as if somehow it might still burst into flame.

After several vain attempts to kindle a fire by means of my file and a variety of flintlike stones, we resigned ourselves to the happy prospect of spending our night in a "cold pack" of rain water, for we dripped like a pair of sponges. Fortunately it was a warm rain, and although smitten by occasional showers, now that the warming effects of our walk had worn away, we realized that things might be a great deal worse. We retired to our watery couch. Joe, who was much more warmly clad than I, removed his heavy coat, and creeping close together, we drew it over our shoulders. Wet as it was, we were decidedly more comfortable. Of course all the mosquitoes, in that particular valley swarmed into the lean-to and proceeded at once to the attack in battle array, music sounding. But (put this to our credit) we had known enough to bring a couple of bottles of ointment, by a liberal use of which we kept most of them at bay. Joe would hug my back awhile until he began to shiver, and then I would hug his. Thus we played flip-flop all night to the accompaniment of the rushing brook, the rain, and the hum of countless mosquitoes. And yet I am bound to say that we were not depressed. Sleep was of course impossible, so we 'swapped yarns' until a gradually increasing grayness warned us of approaching dawn. Then did we arise and stretch our legs, and as soon as we could see the path set out on our return to the landing by the way we had come.

Out of the wrecks of our previous day's lunch I had saved one boiled egg (Joe had mashed his in his pocket by falling over a log), and to this sumptuous repast we looked forward as soon as we should reach the river. The steady tramp soon set in motion our partly congealed blood, and this, together with the promise of sunshine (for the rain had ceased) made us comparatively comfortable. Four or five miles through the woods brought us to the river, where as a breakfast we dispatched our egg and proceeded to browse all the blueberries in sight. We had still four or five hours to wait before the arrival of the launch, and we improved our time by cleaning our fish and drying our clothes on the rocks in the river. But what a sigh of relief went up when that launch rounded the bend! The cap'n had brought along some provisions, together with a guide, who was to hunt us up, if necessary, and told us that he had waited long past his usual time on the preceding night—small comfort to us, who could not have reached the river on account of the darkness! We reached home still damp, but with one good, solid comfort—a handsome string of trout. Nor did either of us suffer the slightest ill effects from our night in the rain; in fact I have yet to learn of any one who ever did from a like experience.

The morals of this little tale (and there are many) are so obvious, and have been impressed so often, that I need not draw them. I knew them all as theory myself before I went on the trip, but experience teaches, and I am now a wiser man from having learned their truth practically.

PISCATOR.

Yukon Notes.—VI.

Personal Outfit.

OUTER clothing for the Yukon should be selected for its wearing qualities rather than warmth. This is my personal conviction given for what it is worth. The secret of being comfortable in extreme cold is to wear just the proper amount of clothing and no more. Perspiration is fatal to comfort, for it is sure to be followed by reaction and chill. The amount of clothing worn should be adapted to the varying conditions of temperature and the kind of exercise one is taking. If a man relies chiefly upon heavy outer clothing for warmth he cannot meet changing conditions satisfactorily. If on the other hand the basis of protection against the cold is heavy underwear, and additional protection is secured by adding one or more outer garments, he is in a position to guard against sudden drops in the temperature and also has provision for times when he is not exercising. If, for instance, he has on enough underwear of the right quality to enable him to work out of doors comfortably in his shirt sleeves when the thermometer is 25 below zero, and has in reserve for colder weather or moments of inaction his coat and sweater, to be worn singly or together, as circumstances dictate, he will find the combination adapted to all the changes of weather commonly met with.

For outer clothing, Mackinaw, moleskin, leather, hard-finish cloth and canvas are all good, provided the quality is the best. I should choose medium weight rather than the heaviest clothing, though a 40oz. Mackinaw coat would be useful for the coldest weather. This coat should be half a dozen sizes too large; if a 38in. coat gives you a snug fit it is well to order a 44. Loose clothing is the warmest, and the heavy underwear, sweaters, etc., worn in winter build a man up and increase his chest measure and girth a great deal more than he is apt to allow for. This general principle should be followed in selecting all clothing for winter use. Even the underwear and footgear should be a number of sizes larger than usually worn.

Mackinaw clothing is good for all conditions of weather until the nap is worn off. It sheds rain and snow fairly well, and is warm. There is at the present time a great deal of shoddy Mackinaw on the market, made to sell, but not to wear. It is cheapest in the end

to deal only with the most reliable firms and take only what they guarantee to be the best.

Moleskin clothing is held in high repute by many old miners. It is said to wear like iron, and this is the "ne plus ultra" in a country where only a limited outfit of clothing can be carried, and where the opportunities for replacing articles are few and far between.

The best corduroy has certain advantages in this respect, but its capacity for soaking up water in wet weather is a serious objection.

Leather is good for all but the coldest weather. Then it is the chilliest thing next to rubber that a man can wear. Cheap leather coats are often rotten, and tear easily on snags. Some leather coats are lined with corduroy, and are reversible. In all that I have seen the corduroy is poor quality, and soon tears out. I suppose that as a matter of fact four-fifths of the clothing made for the Klondike trade is sold under false pretenses. Some of our Western coast cities have gained an unenviable reputation in this respect, for much of the clothing sold fell to pieces on the slightest excuse.

Canvas clothing and overalls and jumpers form an important part of the outfit. Such clothing is frequently worn in winter over other clothing, and is useful for breaking the wind. Furs are not much in evidence in the interior. They are too stiff and too warm to work in, and when a man is outdoors in that country he is always exercising. During the very cold weather there is little wind, and in the dry, bracing atmosphere it is easy to keep up a good circulation. The difficulty is not to keep warm, but to keep from getting overheated.

The Canadian Mounted Police have winter clothing made from canvas and lined with a light-weight blanket material. The parkie worn by most of the men traveling out to the coast on the ice during the winter is made of a light, close-woven cotton material. In appearance it resembles the Chinaman's outer garment, except that it has a hood added, which is generally lined or edged with fur.

Knickerbockers make a good winter rig, and were by no means uncommon. The fact that they do not protect the lower leg is rather an advantage, as the limb between the knee and foot is not apt to be cold. Some kind of a padding or knit band for the knee is a good thing, and for the protection of the front part of the thigh down to the knee a piece of fur or skin is often sewed on, either inside or outside the trousers leg. In the interests of economy a leather seat or reinforced seat is desirable for the bifurcated garment.

Furs worn or used for robes should be of a kind that shed snow easily. Fox is said to be one of the best of furs for this purpose. Australian wombat coats and robes, on the other hand, are said to hold and collect the snow.

The rule seems to be to choose the furs of animals from snowy countries rather than those from warmer climates, on a parallel with the principle that dictates the use of the feathers of water birds in preference to land birds for fly-tying. This question of snow lodging on clothing is of more importance than would perhaps at first appear. Men who live outdoors know how to appreciate it, and the fringing on buckskin garments is said to be for the purpose of keeping them free from snow.

Sweaters are very useful. A medium weight for summer wear and the heaviest made for winter should be included. The latter should have a turtle neck, and either capote or large collar. The sweater with capote is good to sleep in. For shirts, the best quality miners' blue flannel shirts will be found satisfactory. It is difficult, however, to get them in fast color.
